

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

**VAIL-BALLOU COMPANY
BINGHAMTON AND NEW YORK**

PREFACE

In the **NEW INTERNATIONAL YEAR BOOK** for 1914, the eighth in the new series, which began with the 1907 volume, almost every class of articles shows the effects of the great war. One of the most obvious effects is the stoppage of certain sources of statistical information dealing with trade and industry, and many of the articles on those subjects are less detailed in this respect than formerly. The space thus saved has been given to a description of the abnormal conditions caused by the war, and to a fuller treatment than usual of the history of foreign nations. A lucid and compact narrative of the war itself down to the close of the year will be found in the article on **WAR OF THE NATIONS**, written by Professor Carlton Hayes. Supplementing this are such articles as **MILITARY PROGRESS**, **NAVAL PROGRESS**, **BATTLESHIPS**, **SUBMARINES**, **AERONAUTICS**, and the historical paragraphs on the separate countries. The large size of the **YEAR BOOK** and its policy of excluding matters that do not pertain to the calendar year, or are not derived from the latest available information, make it possible to include a more comprehensive discussion of this subject than will be found in other annual volumes of its kind.

As has been said in previous prefaces this **YEAR BOOK** is designed as an encyclopædia of the year, and includes a number of departments that are not found or are not so fully represented in other annuals, for example, **BIOGRAPHY**, **AGRICULTURE**, **POLITICAL HISTORY** of the United States and foreign countries, **SOCIETIES**, and **RELIGIOUS BODIES**. Among the important articles that may be mentioned in the present volume are: **AGRICULTURE** by Dr. E. W. Allen and Dr. A. C. True; **ANTHROPOLOGY AND ETHNOLOGY** by Dr. R. H. Lowie and Dr. Clark Wissler; **ARCHÆOLOGY** by Professor O. S. Tonks; **DRAMA** by Mr. Clayton Hamilton; **INTERNATIONAL ARBITRATION AND PEACE** by Mr. Clinton Rogers Woodruff; **ENGLISH, AMERICAN, FRENCH, GERMAN, ITALIAN, SCANDINAVIAN, and SPANISH LITERATURES**; **PHILOLOGY** by Professors Charles Knapp and J. L. Gerig; **PSYCHOLOGY** by Professor Madison Bentley and Dr. C. A. Ruckmich; **PHYSICS** by Dr. W. W. Stiffler; **CHEMISTRY** by Dr. E. T. Wherry. In addition to articles, which like these cover a very wide field, more specific treatment is given to such topics as **RAILWAYS** by Mr. William E. Hooper, which discusses important matters of current interest; **ELECTORAL REFORM**; **FEMINISM**; **WOMAN SUFFRAGE**; **JEWS**; **EUGENICS**; **EXPOSITIONS**, with a special reference to the Panama-Pacific International Exposition; and **EXPLORATION and POLAR RESEARCH** by General A. W. Greely.

PREFACE

As to the UNITED STATES, some of the chief features are the discussion of the Canal Tolls, Ship Purchase, Trade Commission bills, and the record of the Sixty-third Congress; the results of the elections of November, 1914; the relations of the United States government as affected by the War of the Nations; and the conditions described in the articles SHIPBUILDING, FIRE PROTECTION, BANKS AND BANKING (including an account of the Federal Reserve Act).

FRANK MOORE COLBY.

LIST OF CONTRIBUTORS

AGRICULTURE, HORTICULTURE, FOOD, IRRIGATION, BOTANY, FOR- ESTRY, ETC.

EDWIN WEST ALLEN, PH. D.,
UNITED STATES DEPARTMENT OF AGRICULTURE;
ASSISTED BY EXPERTS IN THE DEPARTMENT OF
AGRICULTURE AT WASHINGTON,
AND

ALFRED CHARLES TRUE, PH. D.,
UNITED STATES DEPARTMENT OF AGRICULTURE.

ANTHROPOLOGY AND ETHNOLOGY

ROBERT H. LOWIE, PH. D.,
AMERICAN MUSEUM OF NATURAL HISTORY, AND
CLARK WISSLER, PH. D.,
AMERICAN MUSEUM OF NATURAL HISTORY.

ARCHÆOLOGY

OLIVER SAMUEL TONKS, PH. D.,
PROFESSOR OF ART, VASSAR COLLEGE.

ARCHITECTURE

RICHARD F. BACH,
CURATOR, SCHOOL OF ARCHITECTURE, COLUMBIA
UNIVERSITY.

ASTRONOMY AND METEOROLOGY

T. W. EDMONDSON, PH. D.,
PROFESSOR OF MATHEMATICS, NEW YORK UNI-
VERSITY.

CELEBRATIONS, CHEMISTRY, INDUS- TRIAL, AND EXPOSITIONS

MARCUS BENJAMIN, PH. D., Sc. D., LL. D.,
EDITOR FOR THE UNITED STATES NATIONAL
MUSEUM.

CHEMISTRY

EDGAR T. WHERRY, PH. D.,
ASSISTANT CURATOR, DIVISION OF MINERALOGY,
UNITED STATES NATIONAL MUSEUM.

DRAMA

CLAYTON HAMILTON,
DRAMATIC CRITIC OF THE "BOOKMAN."

ECONOMIC AND POLITICAL SCIENCE

FRANK HAMILTON HANKINS, PH. D.,
ASSISTANT PROFESSOR OF ECONOMICS AND SOCI-
OLOGY, CLARK COLLEGE.

EDUCATION

MILO B. HILLEGAS, PH. B.,
ASSISTANT PROFESSOR OF ELEMENTARY EDUCA-
TION, TEACHERS COLLEGE, COLUMBIA UNIVER-
SITY.

ELECTORAL REFORM

W. W. PIERSON, JR.,
INSTRUCTOR IN HISTORY, COLUMBIA UNIVERSITY.

ELECTRICAL ENGINEERING AND PHOTOGRAPHY

REGINALD GORDON.

EUGENICS

ALVAN A. TENNEY, PH. D.,
ASSISTANT PROFESSOR OF SOCIOLOGY, COLUMBIA
UNIVERSITY.

EXPLORATION AND POLAR RE- SEARCH

A. W. GREELY, PH. D.,
MAJOR-GENERAL, UNITED STATES ARMY.

FEMINISM

JULIET STUART POYNTZ, A. M.,
AMERICAN ASSOCIATION FOR LABOR LEGISLATION.

FOREIGN GAZETTEER

EDWARD LATHROP ENGLE AND
ALLAN EVA ENGLE.

FOREIGN HISTORY AND POLITICS

CARLTON H. HAYES, PH. D.,
ASSISTANT PROFESSOR OF HISTORY, COLUMBIA
UNIVERSITY.

GEOLOGY

DAVID HALE NEWLAND, A. B.,
ASSISTANT STATE GEOLOGIST, NEW YORK.

INTERNATIONAL ARBITRATION AND PEACE

CLINTON ROGERS WOODRUFF, LL. B.,
SECRETARY OF THE NATIONAL MUNICIPAL
LEAGUE AND OF THE MOHONK CONFERENCE, AND
PRESIDENT OF THE BOARD OF PERSONAL REGIS-
TRATION, PHILADELPHIA.

JEWES AND JUDAISM

DAVID A. MODELL, A. M.

LIBRARY PROGRESS

WILLIAM W. BISHOP, A. M.,
SUPERINTENDENT OF THE READING ROOM, LI-
BRARY OF CONGRESS, WASHINGTON, D. C.

LITERATURE, ENGLISH AND AMERI- CAN

EDWIN E. SLOSSON, PH. D.,
LITERARY EDITOR, "THE INDEPENDENT."

LITERATURE, FRENCH

ALBERT SCHINZ, PH. D.,
PROFESSOR OF FRENCH LITERATURE, SMITH COL-
LEGE.

LITERATURE, GERMAN

AMELIA VON ENDE,
CONTRIBUTOR TO NEW YORK "EVENING POST"
AND "THE NATION,"

LITERATURE, ITALIAN

ALBERT ARTHUR LIVINGSTON, PH. D.,
ASSISTANT PROFESSOR OF THE ROMANCE LAN-
GUAGES AND LITERATURE, COLUMBIA UNIVER-
SITY.

LITERATURE, SCANDINAVIAN

HARRY V. E. PALMBLAD, A. M.,
INSTRUCTOR IN GERMANIC LANGUAGES AND LIT-
ERATURES, UNIVERSITY OF KANSAS.

LITERATURE, SPANISH

JOHN DRISCOLL FITZ-GERALD, PH. D.,
MEMBER OF THE HISPANIC SOCIETY OF AMERICA,
CORRESPONDING MEMBER OF THE SPANISH ROYAL
ACADEMY, ASSISTANT PROFESSOR OF ROMANCE
LANGUAGES, UNIVERSITY OF ILLINOIS.

**MANUFACTURES, CIVIL ENGINEER-
ING, TECHNOLOGY, AERONAUTICS,
AND FIRE PROTECTION**

HERBERT TREADWELL WADE.

MEDICINE

ALBERT WARREN FERRIS, A. M., M. D.,
MEDICAL EXPERT TO STATE RESERVATION COM-
MISSIONERS AT SARATOGA SPRINGS; CONSULT-
ING PHYSICIAN, ITALIAN HOSPITAL, NEW YORK;
AND OF BINGHAMTON STATE HOSPITAL; FORMER
SENIOR RESIDENT PHYSICIAN, GLEN SPRINGS,
WATKINS, N. Y.; FORMER PRESIDENT, N. Y.
STATE COMMISSION IN LUNACY; FORMER ASSIS-
TANT IN NEUROLOGY, COLUMBIA UNIVERSITY;
FORMER ASSISTANT IN MEDICINE, NEW YORK
UNIVERSITY AND BELLEVUE HOSPITAL MEDICAL
COLLEGE; ASSISTED BY

DAVID GILBERT YATES, M. D.,
SURGEON, NEW YORK CHILDREN'S HOSPITAL;
SURGEON, DEMILT DISPENSARY, NEW YORK CITY.

MILITARY PROGRESS

C. DEW. WILLCOX,
LIEUTENANT-COLONEL, U. S. A., PROFESSOR OF
MODERN LANGUAGES, U. S. MILITARY ACADEMY.

MILITARY STATISTICS, FOREIGN

HERBERT TREADWELL WADE.

MUSIC

ALFRED REMY, M. A.,
EXTENSION LECTURER, COLUMBIA UNIVERSITY;
FORMER PROFESSOR OF HARMONY AND COUNTER-
POINT, INTERNATIONAL CONSERVATORY, NEW
YORK; LECTURER ON THE HISTORY OF MUSIC,
NEW YORK COLLEGE OF MUSIC.

**NAVAL PROGRESS AND BATTLE-
SHIPS**

LEWIS SAYRE VAN DUZER,
CAPTAIN IN THE UNITED STATES NAVY, RETIRED;
EX-SECRETARY OF THE UNITED STATES NAVAL
INSTITUTE.

PAINTING AND SCULPTURE

FORBES WATSON,
CONTRIBUTOR TO THE NEW YORK "EVENING
POST" AND "THE NATION."

PHILOLOGY

CHARLES KNAPP, PH. D.,
PROFESSOR OF CLASSICAL PHILOLOGY, BARNARD
COLLEGE, COLUMBIA UNIVERSITY; AND
JOHN LAWRENCE GERIG, A. M., PH. D.,
ASSOCIATE PROFESSOR OF CELTIC, COLUMBIA
UNIVERSITY.

PHILOSOPHY

FRANK THILLY, A. M., PH. D., LL. D.,
PROFESSOR OF PHILOSOPHY, SAGE SCHOOL OF
PHILOSOPHY, CORNELL UNIVERSITY.

PHYSICS

WILLIAM W. STIFLER, PH. D.,
INSTRUCTOR IN PHYSICS, COLUMBIA UNIVER-
SITY.

**PSYCHOLOGY, PSYCHICAL RE-
SEARCH, AND PSYCHOTHERAPY**

MADISON BENTLEY, B. S., PH. D.,
HEAD OF THE DEPARTMENT OF PSYCHOLOGY,
UNIVERSITY OF ILLINOIS; AND
CHRISTIAN A. RUCKMICH, PH. D.,
INSTRUCTOR IN PSYCHOLOGY, UNIVERSITY OF
ILLINOIS.

RAILWAYS

WILLIAM E. HOOPER,
ASSOCIATE EDITOR, "RAILWAY AGE GAZETTE."

**SANITARY ENGINEERING AND MU-
NICIPAL ACTIVITIES**

MOSES NELSON BAKER, PH. B., C. E.,
EDITOR OF THE "ENGINEERING NEWS."

SPORTS

CHARLES A. TAYLOR,
MEMBER OF THE STAFF OF THE NEW YORK
"TRIBUNE."

UNIVERSITIES AND COLLEGES

MILO B. HILLEGAS, PH. D.,
ASSISTANT PROFESSOR OF ELEMENTARY EDU-
CATION, TEACHERS COLLEGE, COLUMBIA UNIVER-
SITY.

WAR OF THE NATIONS

CARLTON H. HAYES, PH. D.,
ASSISTANT PROFESSOR OF HISTORY, COLUMBIA
UNIVERSITY.

ZOOLOGY AND BIOLOGY

AARON L. TREADWELL, PH. D.,
PROFESSOR OF BIOLOGY, VASSAR COLLEGE.

-	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---

NOTE: In certain tables in this work it will be found, by addition, that the totals do not correspond to the sum of the items. This is the result of the omission or inclusion of certain small items which are not mentioned in the table, but are included in the totals. This is a usage frequently employed in the compilation of government statistics, from which sources the greater number of the tables in the YEAR BOOK are taken.

THE NEW INTERNATIONAL YEAR BOOK

A. B. C. MEDIATION. See INTERNATIONAL ARBITRATION AND PEACE, and MEXICO, *A. B. C. Mediation*.
ABSINTHE. See ALCOHOL.

ABSOLUTE ZERO. See PHYSICS.
ABYSSINIA. (Anciently ETHIOPIA.) An absolute monarchy in eastern Africa under a Christian sovereign, composed of several so-called kingdoms (Tigré, Gojam, Shoa, Amhara) together with territories and dependencies under subject chiefs. The area is estimated at approximately 432,000 square miles. The population, composed mainly of Semitic Abyssinians, Gallas, and Somalis, negroes, Falashas, and non-natives, numbers between 9 and 11 millions. The national religion is Coptic Christian (monophysitism); but there are great numbers of Mohammedans and pagans. Addis Abeba, the capital, has a permanent population estimated at over 60,000 and a floating population of about 30,000; Harrar has about 40,000 and Diré Dawa has about 5000.

Grazing is practiced, and a primitive sort of agriculture is carried on. The forests yield rubber and valuable timbers. Gold-mining tracts extend along the banks of the Baro River, and coal has been found. The imports (chiefly from Great Britain, France, India, Italy, and the United States) are gray shirting, cotton goods, arms and ammunition, food-stuffs, beverages, railway material, and petroleum. The exports are hides and skins, coffee, wax, ivory, civet, etc. The total trade by way of Jibuti in 1911 was valued at 8,722,531 francs imports, and 11,765,844 francs exports; by way of Eritrea, 2,320,558 lire imports, and 3,072,100 lire exports; by way of Gambela in the Sudan, £E 27,962 imports, and £E 37,754 exports. The principal articles of export via Jibuti were skins, 4865 francs; coffee, 4567; ivory, 1137; wax, 986,000. A British source gives the total trade through Jibuti in 1912, imports and exports, at £588,924; imports through the Sudan £34,280 and exports, £38,720. The total trade between Abyssinia and Great Britain in 1912 is given at £3661 imports and £4926 exports.

A railway extends from Jibuti to Diré Dawa, a distance of 309 kilometers, of which 219 kilometers are in Abyssinian territory. An extension from Diré Dawa to Meheesso, 152 kilometers, was opened in 1913; the extension from Meheesso to Addis Abeba, 328 kilometers, is under construction. Telegraph lines connect the capital with Harrar, with Jibuti, and with Massaua in Eritrea. There is an extensive telephone system.

Beyond the capital roads are almost unknown. Transport is by pack animals. The financial business of the government is transacted by the Bank of Abyssinia. The current coin of the country is the Maria Theresa dollar, but the new Menelek dollar (the talari, worth about 50 cents) is the official standard. The government is essentially of a feudal character. Each large province is governed by a *ras*, a prince or feudal chief. At the head of the state is the Emperor. Lij Yasu, born 1897, succeeded Menelek II in December, 1913. He is the son of Menelek's second daughter Waizaro Shoa Rogga and Ras Mikael, the chief of the Wollo Gallas.

ARMY. There is a regular army formed of contingents from the various departments and aggregating about 150,000 men stationed in various garrisons. In addition there are irregulars and a territorial army. Seven batteries of artillery and machine guns taken at the battle of Adua are located at Addis Abeba. Every man in the regular army is supposed to be mounted, though this condition is not realized, and in addition to the chiefs and their retainers summoned for war, there is a permanent force of mercenaries maintained by the King armed with rifles and known as Wottader.

ACADEMY, FRENCH (ACADEMIE FRANÇAISE). The first to be founded (1635) and the most noted of the five academies constituting the Institute of France, the other four being: the Academy of Inscriptions and Belles-lettres, the Academy of Sciences, the Academy of Fine Arts, and the Academy of Moral and Political Science. The members of the French Academy, elected for life, and known as the "Forty Immortals," take rank as the leading French men of letters of their time; and collectively they are the last resort in all disputed literary matters. 1500 francs is given as a yearly honorarium to each member, and more than 12,000 francs distributed annually in prizes. During 1914 five members died: Jules Claretie; Jules Lemaitre; Albert, Count de Mun; Charles Jean Melchior, Marquis de Vogué; and Henri Roujon; three new members were elected: Alfred Capus, to succeed Henri Poincaré; Pierre de la Gorce, to succeed Thureau-Daugin; and Henri Bergson, to succeed Emile Ollivier. At the end of 1914 there were five vacancies.

ACADEMY OF ARTS AND LETTERS, AMERICAN. A body of distinguished men, to some extent patterned after the French Academy. Its membership, limited to 50, is drawn by ballot from that of the National Institute of Arts

and Letters; its president, since 1909, has been William Dean Howells. The Academy, since its founding in 1904, and the Institute hold annual joint meetings, the last of which, in October, 1914, took place in New York. On that occasion an address was delivered by Eugene Brieux, French dramatist, who brought the greetings of the French Academy and of President Poincaré. It was announced that provision had been made for a permanent home for the Academy and Institute, in New York. Various prizes were awarded, the chief one (the Academy's gold medal) to John Singer Sargent, the painter. No new members were elected to the Academy in 1914, although there were two vacancies. The membership then included: William Dean Howells, Henry James, Henry Adams, Thomas Raynesford Lounsbury, Theodore Roosevelt, John Singer Sargent, Alfred Thayer Mahan, Daniel Chester French, John Burroughs, James Ford Rhodes, Horatio William Parker, William Milligan Sloane, Robert Underwood Johnson, George Washington Cable, Andrew Dickson White, Henry Van Dyke, William Crary Brownell, Basil Lanneau Gildersleeve, Woodrow Wilson, Arthur Twining Hadley, Henry Cabot Lodge, Francis Hopkinson Smith, Edwin Howland Blashfield, William Merritt Chase, Thomas Hastings, Hamilton Wright Mabie, Brander Matthews, Thomas Nelson Page, Elihu Vedder, George Edward Woodberry, Kenyon Cox, George Whitefield Chadwick, Abbott Handerson Thayer, John Muir, Charles Francis Adams, Henry Mills Alden, George de Forest Brush, William Rutherford Mead, John W. Alexander, Bliss Perry, Abbott Lawrence Lowell, James Whitcomb Riley, Nicholas Murray Butler, Paul Wayland Bartlett, Owen Wister, Herbert Adams, Augustus Thomas, Timothy Cole.

ACCIDENTS. See RAILWAY ACCIDENTS; SAFETY AT SEA; WORKMAN'S COMPENSATION.

ADAMS, JOHN LANSON. An American physician and surgeon, died Sept. 26, 1914. He was born at Westport, Conn., in 1860, and was educated at Yale University, graduated at the College of Physicians and Surgeons, New York City, in 1886, and studied at medical colleges abroad for two years. From 1892 he practiced his profession in New York City. He was successively president of the New York School of Clinical Medicine; attending surgeon, New York Eye and Ear Infirmary; consulting ophthalmologist and otologist, to Society of the Lying-in Hospital and Manhattan State Hospital. He was also a member of several otological and ophthalmological associations.

ADEN. A British dependency, in southwestern Arabia; a part of the Bombay Presidency. The peninsula has an area of 75 square miles, besides a strip of mainland about three miles wide, and the island of Perim (5 square miles). Total pop. (1911), 46,165. The protectorate covers some 9000 square miles, with an estimated population of 100,000. The strongly fortified town of Aden is an important coaling and trading station. The trade is almost entirely a transshipment one, the leading imports being cotton goods, grain, hides and skins, and tobacco. The exports include the articles mentioned as imports, besides coffee, gums, civet, ivory, and wax. In 1907-08 the sea-borne imports were valued at Rs. 44,699,050; sea-borne exports, Rs. 40,471,126 (one rupee = 32.44 cents); imports and exports by land, Rs. 2,475,007 and Rs. 1,652,492,

respectively. The total trade in 1911-12 was £8,252,814, of which £6,251,717 was foreign trade, £1,607,096 private Indian trade, and £394,001 land trade. The imports of merchandise in the private foreign trade amounted to £2,343,745; exports, £2,689,509. Imports in private Indian trade amounted to £952,915; exports, £248,818. Imports, land trade, £227,709; exports, £153,133. The settlement is subject to the government of Bombay, the resident being also commander of the troops in garrison. Maj. H. F. Jacob was political agent in 1914.

ADMINISTRATION. See UNITED STATES.

ADULTERATION. See FOOD AND NUTRITION, *passim*.

ADVANCEMENT OF SCIENCE, AMERICAN ASSOCIATION FOR THE. The 65th annual meeting of the association was held in Philadelphia Dec. 28, 1914, to Jan. 2, 1915. There were 1086 members in attendance. At the same time several societies affiliated with the association held their meetings. These included the American Physical Society, the Geological Society of America, Paleontological Society of America, American Alpine Club, American Society of Zoologists, American Society of Naturalists, American Association of Entomologists, Entomological Society of America, Botanical Society of America, American Phytological Society, Society for Horticultural Science, Sullivant Moss Society, American Microscopical Society, American Anthropological Association, American Folk-Lore Society, American Psychological Association, Society of American Bacteriologists, American Nature Study Society, and other scientific societies. The meeting was called to order by the retiring president, Dr. Edmund B. Wilson, who introduced the president of the meeting, Dr. Charles W. Eliot. After the address of welcome, to which Dr. Eliot replied, Dr. Wilson delivered the annual address on "Some Aspects of Progress of Modern Zoology." The council elected 256 members and 620 fellows. Two public lectures in honor of the citizens of Philadelphia were delivered: one by Dr. Dayton C. Miller on "The Science of Musical Sounds"; the other by Dr. William H. Nichols on "The War and the Chemical Industry." The following officers were elected: President, W. W. Campbell; Vice-presidents (section A) A. O. Leuschner, (B) Frederick Slate, (C) W. McPherson, (D) Bion J. Arnold, (E) C. S. Prosser, (F) V. L. Kellogg, (G) W. A. Setchell, (H) G. M. Stratton, (I) George F. Kunz, (K) F. P. Gay, (L) E. P. Cubberly, (M) Eugene Davenport; General Secretary, Henry Skinner; Secretary of Council, W. E. Henderson. Dr. L. O. Howard was again reelected Permanent Secretary for five years. There will be a summer meeting at San Francisco, Aug. 2-7, 1915. The 1915-16 winter meeting will be held at Columbus, Ohio. A convocation week meeting is recommended for New York City in 1916-17, and a meeting in 1917-18 is to be held either in Pittsburgh or Toronto.

ADVANCEMENT OF SCIENCE, BRITISH ASSOCIATION FOR THE. The annual meeting of the association, which was founded 83 years ago, was held in Australia in August, 1914, the meetings taking place in Perth, Adelaide, Melbourne, Sydney, and Brisbane, though the principal sessions were held in Melbourne and Sydney. About 350 members came from Britain to attend the meeting. Before the various sessions

began Britain had declared war on Germany, and this raised the question as to the attitude of the association toward the German visitors. It was finally decided, though not without expressions of dissent, to ignore the war so far as concerned the presence of the German scientists, upon some of whom degrees were conferred at Adelaide and Melbourne. The only changes in the official programme were the abandonment of the trip to New Zealand, and the early return to Britain of many of the members. After a meeting of part of the members at Perth, West Australia, a full meeting of the association was held at Adelaide, South Australia, where notable addresses were given by Sir Oliver Lodge, Prof. W. J. Sollas, Sir C. P. Lucas, and A. D. Hall. Later at Brisbane addresses were delivered by Prof. H. E. Armstrong on "The Materials of Life," by Sir Edward Schäfer on "Australia and Science," and by Prof. J. W. Gregory. At Melbourne the first, and later at Sydney the second, part of the presidential address was delivered by Prof. William Bateson, the subject being the factors of heredity. The regular work of the various sections was varied by joint discussions, especially between the botanical and zoological sections. Noteworthy incidents during the voyage to Australia were successful observations on "Gravity over the Oceans," "Ocean Plankton," and "Sea Temperature and Salinity," respectively by Profs. Duffield, Herdman, and Holt.

ADVENTISTS. The Seventh Day Adventists, the largest branch of this denomination throughout the world had at the close of 1913, 122,386 communicants, a gain for the year of 12,794. In North America there were 71,054 communicants. The churches numbered 3589, a gain of 715 during the year. The total funds for evangelistic work contributed by the members of the denomination during 1913 was \$2,866,727. Of this amount, 62 per cent was raised in tithes, which is the main source of revenue of the denomination. The total value of church buildings at the end of 1913 was \$12,812,784. The denomination conducted 786 schools, having an enrollment of 27,379. There were 37 publishing houses and branches under the control of the denomination. Over 1600 missionaries were stationed in 67 different countries. To support this work in foreign lands there was expended \$911,769.

The other branches of the denomination are the Advent Christians, with about 27,000 communicants, 550 churches, and 530 ministers; Church of God in Jesus Christ, with 2224 communicants, 68 churches, and 61 ministers; the Evangelical Adventists; the Church of God; and Advent Union. The three last named have only several hundred communicants each.

ÆGEAN ISLANDS. See GREECE.

AERONAUTICS. Activity in aeronautics during 1914 naturally consisted principally in the military use of aeroplanes and airships, and in their construction in large numbers for the fighting armies rather than in new and striking developments. Such practical applications afforded ample opportunity to test not only theories as to their actual use in warfare, but also the strength and features of design and construction followed or favored by the aeronautical divisions of the various armies. In the main such operations were kept profound se-

cret during the year, and few technical details were forthcoming. It may be said, however, that the chief use of aeroplanes was in determining the position of the enemy and especially for determining ranges for field and siege guns, thus increasing the accuracy of artillery fire. Various raids were made and explosives were dropped from aeroplanes and airships, but this branch of warfare, aside from its spectacular nature and moral effect did not play an important part in the conflict. Reference to the articles, **MILITARY PROGRESS** and **NAVAL PROGRESS**, will show what was accomplished on land and sea by aeroplanes and airships, as well as their tactical uses and the lessons derived.

More than ever in view of the European War the economic importance of aeronautics figured. It was estimated that the warring nations previous to the war had spent \$100,000,000 on aeronautical equipments, and had proposed to spend \$200,000,000 more in the next two years. At the opening of hostilities it was thought that they possessed in the aggregate some 5000 aeroplanes, and over 100 dirigibles. Statistical information on this score was distinctly vague and inadequate. Also in regard to developments much of the recent work had been done at government factories or by private factories under government auspices, and government control, so that little news had leaked out as to the extent or nature of special advances in design and construction, and in fact it was only through the appropriation bills discussed in the various parliaments that any adequate idea could be formed of the nature and extent of the equipment, except such as was obtained through military and naval channels. Germany and Russia for two years previous had kept secret their progress in military and naval aeronautics, while in 1913 Great Britain and France also decided to limit the announcement of developments and increase in the strength of their aerial fleets as well as experimental developments. As a result little exact knowledge was popularly held of what had been done by the governments during the year, while manufacturing for exhibition purposes or for private owners had not reached the point where it assumed preponderating importance.

In the United States soon after the outbreak of the war the European Powers were in the American markets for aeroplanes and aeroplane equipment, and orders were placed with American manufacturers. The nature and extent of these naturally also were kept secret, but it was known that the end of the year 1914 the larger manufacturers were active, and the factories were running to capacity.

In connection with the use of aeroplanes in the war, it was early developed that these machines themselves in view of the limited facilities for their replacement, were too valuable to use in actual fighting, as they were far more useful for reconnaissance and range finding for artillery. In fact as will be discussed under **MILITARY PROGRESS**, the rôle of the aeroplane in connection with firing both of artillery and the finding of artillery positions assumed an importance that hardly had been realized.

The increased length and time of duration of flights during the year indicated more perfect control, greater reliability and endurance of all the leading models. This reflected better engine construction and embodied the results of scientific study and elaborate experimentation, con-

ducted in well-equipped laboratories, which had been established in Europe, and which in a far lesser degree had been inaugurated in the United States. In preparation for the transatlantic and other long distance flights, reliability and endurance tests of motors were made, and these represented substantial achievement and promised well for performance in actual flight. Perhaps one of the most important results of the year to be observed was the increased flexibility in speed, that is, *aéroplanes* were flown with not only greater maximum speed, but also were able to fly at lower speeds and capable of variation of speed between these limits. In addition, an important feature of the year was the addition of automatic stabilizing devices, which tended greatly to facilitate the task of the pilot and made flight more convenient, as will be seen from the subjoined records. Satisfactory performance with greater carrying capacity was another feature of the year's work, and the development, though slow, was steady, and indicated positive advance.

As showing the practical development of the modern *aéroplane* the statement was made during the year that the English Army *Aéroplane Squadron* flew under their own power from the base of operation in England to the seat of action in France, where they proved of great advantage in reconnoitring the forces.

TESTING THE LANGLEY AÉRODROME. An important event of the year in *aéronautics* was the testing of the Langley *aérodrome*, built in 1903. This machine and its engine were shipped from the Smithsonian Institution to the Curtiss factory at Hammondsport, N. Y., early in April for this purpose. Mr. Glenn H. Curtiss conducted the tests, which were intended to prove beyond peradventure that the large Langley *aérodrome* of 1903 was capable of sustaining free flight with a man, and had it not been for accidents in the launchings of September and December, 1903, it would have demonstrated successfully at that time the practical possibilities of sustained flight by a machine heavier than air. The original machine was reclothed without change of size or shape, and the framing, engine, propellers, wings, rudders, and controls were put in adjustment just as Langley left them. The first change was to add a modern radiator and carburetor, and to employ floats, so that the machine could rise from water. In this way over 200 pounds extra weight and considerable air resistance was added to the original machine. On May 27, Mr. Curtiss mounted the machine, which, without wings and tail, was adjusted for a preliminary trial on the surface of the lake. It made a short though successful run over the surface of the lake, skimming along in such a way as to indicate that with the addition of the wings successful flight could be accomplished. This was achieved on the following day, when the machine rose on an even keel, and sailed over the surface of the lake under the control of the aviator. The addition of the floats and the trussing connected with the *aéroplane* proper, together with the additional weight of Mr. Curtiss as the pilot, increased the weight of the machine some 40 per cent over its weight of 1170 pounds when tested in 1903 with Mr. Manly as pilot.

It is of interest to refer to this machine and to recall some of its general features. It was the first *aéroplane* provided with an internal

combustion motor, the first capable of carrying a passenger in sustained flight, and the first *aéroplane* designed with inherent stability to take care of itself in bad weather. It was a tandem monoplane driven by twin propellers, and above were mounted four great dragon-fly wings, with a long double tail, while the steering rudder was placed beneath and behind the centre. These wings were connected to a steel frame and the propellers on either side were run from bevel gears, connected with an engine placed in the frame, behind the forward wings. Unlike modern *aéroplanes* no running gear was provided, nor pontoons, as it was designed to employ a special launching apparatus, a feature that proved most disastrous in the original tests.

Later in the year a Curtiss 90-horsepower motor with a direct connected tractor screw was mounted on the forward part of the frame of the Langley *aérodrome* in place of the original motor and twin propellers. This was done in view of the fact that the success of the original motor had been established in raising the machine and maintaining it in flight, but it was not desirable to overstrain its capacity, especially in view of its importance as a historic relic. Various tests of the *aérodrome* were made. The *aérodrome* over short voyages was under easy control, but naturally lacked the ease of operation of modern airships, as in the wings anemometer adjustments had been provided by Professor Langley, which were dependent on the wind-vane or vertical rudder, and the big tail or elevator. The latter being used by the Curtiss investigators instead of the wind-vane rudder, which Langley thought could steer the machine. This series of experiments conducted at Hammondsport proved of great value in demonstrating the possibilities of the original machine and added to the historic record made by Professor Langley and his associates and their successors.

THE SCHMITT BIPLANE. In the Paul Schmitt biplane, with which some notable records were made during the year, a novel method of varying the incidence was obtained, in which the maximum efficiency was preserved with variations in load and motive power. This made it possible for the machine to rise after a very short run with the tail high, without the use of wings as a brake; in fact it could rise or alight in an enclosure 400 feet long surrounded by a fence 6 feet high. The Paul Schmitt biplane, as developed in 1914, was made with a fuselage of steel tubes autogenously welded and of quadrangular section, and carried a 160-horsepower Gnome motor. Two planes were furnished and were the most interesting portion of the machine, rotating about a transverse horizontal axis, placed high up between the planes and about one-fourth of the distance from the front to the back. This axis consisted of a tube mounted on ball-bearings, carried on a pair of inverted V-stanchions. Its extremities were rigidly attached to two sections of the oval tubes placed far out between the front and rear uprights of the central cellule. The uprights pass through the fuselage, and are connected at the bottom by steel tubes as also at the top. The pivoting of the plane is controlled by a strong thread, carried on ball-bearings attached in a longitudinal position to the bottom of the fuselage. This shaft is prolonged behind the rear bearings and terminates in two concentric sprockets, connected by chains with

wheels controlled by the pilot. These wheels permit of a slow or more rapid movement so that the cellule and the planes to which the cellule is attached can be swung through an arc of from 10 to 12 degrees, the amount of rotation being controlled with a nicety by the two hand-wheels. The planes are divided into two parts, each assembling into the central cellule. There are large ailerons fitted in the proper place, while the elevator is very large and forms an entire tail plane being perfectly flat and of the nonrevolving type. There are two rudders, one above and one below the elevator, both rudders and elevator being composed of steel tubes, covered with fabric.

In connection with the development of useful military aeroplanes, a new Curtiss military tractor was brought out during the year and tested at the Army Aviation Camp on North Island, near San Diego, Cal. It was known as the Model J, Curtiss military tractor, and was equipped with a 90-horsepower OX Curtiss motor. The width of the wings of the upper plane was 42 feet, 2 inches, and of the lower plane 30 feet. With the pilot, passenger and four hours' supply of fuel it maintained a maximum speed of 85.7 miles an hour, and a minimum speed of 41½ miles. It was able to climb 4000 feet in 10½ minutes.

The new Wright military flyer, known as Model H, also was brought out during the year. It was a biplane of the two-passenger type with a fuselage, and was driven by a Wright six-cylinder 60-horsepower engine, placed under the front hood of the fuselage, the hood being removable so as to make the motor accessible. The planes had a total area of 350 square feet, and were 36 feet in width, and 26½ feet from front to rear over all, and a height over all of 9 feet. A speed of 70 miles an hour was maintained, and the machine could climb 400 feet per second with two men and fuel for 4 hours. There were two propellers in the rear of the main plane driven by a motor at the extreme front of the fuselage, and the pilot and passenger sat side by side behind the motor, with a duplicate system of control operated from both sides.

THE WANAMAKER TRANSATLANTIC FLYER. In February, 1914, Mr. Rodman Wanamaker of Philadelphia announced that he had commissioned Glenn H. Curtiss to build a floating flying boat capable of making a transatlantic trip in a single flight of from 12 to 15 hours. This seemed to indicate the most complete preparations for crossing the Atlantic Ocean, and that competent authorities considered the project possible in view of the flight of Ingold, who covered a distance of 1000 miles in 16 hours, and of Stöfler, who had made 1340 miles in 24 hours. The question of whether the flight would be a successful one hinged largely upon the motor and its reliability. The original plan involved a tractor biplane with one direct connected 200-horsepower engine, with a detachable running gear, which had a water hull for sea driving in case of necessity and water-tight compartments, for the safety of the aviators. The plan was to rise from St. Johns, N. F., leave behind the chassis, ascend to a point two miles above sea-level, and with a permanent easterly wind of an average speed of 50 miles an hour, and with the 60 miles speed of the aeroplane itself, proceed direct to Ireland and cover the journey in some 18 or 20 hours. As this plan would not permit

of rising or resting on the ocean, in case of stoppage of the motor or other mischance, it was decided instead to use a large Curtiss flying boat, capable of carrying two passengers with supplies for more than twenty hours, and capable of descending and rising at will in mid-ocean. It was not intended to take advantage of the upper streams of the atmosphere, but to start when the weather forecast seemed propitious, and lay a direct and practical course, flying as circumstances dictated.

Accordingly the flying boat was constructed along these lines, and was the largest flying craft ever built in the United States. It measured 72 feet from wing tip to wing tip on the top plane, and 46 feet on the bottom plane; it measured 38 feet from prow to the end of the vertical rudder; it spreads 500 square feet of wing surface, the wings being 7 feet wide, having a gap between them of 7½ feet. Complete with two men and supplies, the flying boat weighed about 5000 pounds, the hull was 34 feet long, 4 feet in beam, and 6½ feet in depth. It embodied most of the features previously employed in the Curtiss flying boats, with additions for the comfort of the pilots for an extended voyage. There were four water-tight compartments within the hull, and gasoline tanks with an aggregate capacity of 1500 gallons, which could be pumped above to the feed tanks and supplied by gravity to the engine as required. In designing the wings of the machine the contour was found only after a systematic aerodynamic investigation, which had been conducted by the British Government, and found to be the most efficient and practical wing. The two engines were each of 90-horsepower, and water jacketed, running at 1200 r.p.m., and weighed together 690 pounds. The radiators weighed 62 pounds each. A 30-hour continuous test was held, in which time the engines together consumed 288½ gallons of gasoline, and 10½ gallons of oil, or about 1800 pounds. As pilot of the transatlantic flyer, Lieut. John Cyril Porte, R. N. of England, was selected as navigator, and Mr. George Hallett as chief aviator, it being planned that Mr. Hallett should be dropped at the Azores, and Mr. John Lansing Callan of the Curtiss Flying School should take his place to complete the trip.

The new Wanamaker flyer was christened at Hammondsport on June 22, and received a successful trial subsequently. In preliminary tests the total weight carried was about three-fourths of a ton short of the 5000 pounds to be lifted at St. Johns, and the engines were run at a less speed. Nevertheless, the craft performed successfully. In the course of the experiments large pontoons were also attached to either side of the boat flush with the bottom, and planing boards, making what was known as a sea-sled, were used, and the bottom of the hull was remodeled. A third motor late in July was fitted in place, which, while it increased the weight, nevertheless increased the lifting power. The third motor propellers were mounted on the top of the upper plane in its centre of lift. The experiments had as their object to determine whether the aeroplane flight was possible with two of the motors working and the third held for a reserve or for lifting power.

In connection with the cruise of the *America* many aviators thought that the hardest task would be to lay and maintain a course from St.

Johns to the Azores, as was finally decided on, a distance of about 1080 miles on Mercator's Projection. The course as laid out in land miles was: from St. Johns to the Azores, about 1198 miles; from the Azores to Spain, 927 miles; to Ushant on the coast of France, 413 miles; to Falmouth, in England, 95 miles.

The *America* represented a vast amount of experimentation and research, and during its construction and testing changes were being made, and the fundamental ideas were being developed. This was no less important than that the boat as originally designed should have used the experience acquired. Unfortunately, the outbreak of the war required the postponement of the actual trip of the *America*.

SIKORSKY AÉROPLANE. The Russian aeroplane or "aërobus" of Sikorsky made a number of records previous to its destruction in the military operations of the war. On June 19 he rose to a height of 2000 meters (6200 feet) with 10 passengers, in 1 hour, 26 minutes, and 21 seconds, and during the night he made a flight with six passengers which lasted for 6 hours, 33 minutes, and 10 seconds. The aeroplane was fitted with two Salmons 200-horsepower motors. It was reported later in the year that this large aeroplane had been destroyed by shell fire on the frontier. It was an aeroplane of considerable capacity, but not of high speed, and it was understood to be a prototype of a number of other machines which had been ordered by the Russian Government. The dimensions of the *Ilya Murnatz* were: span 121 feet, chord of the planes 9 feet, with a covered-in fuselage 65 feet from nose to tail, and 6 feet in height by $5\frac{1}{2}$ feet in width. The fuselage carried a small cabin for the two pilots in the nose and had a cabin for the passengers with a small sleeping compartment, and a very small lavatory, and these cabins were lighted by electricity, and heated by the exhaust from the engine. The rudder had an area of 55 square feet. The chassis was mounted on disc wheels sprung on elastic shock absorbers, which supplanted the skids used in the original design. This machine carried aloft 18 human beings, and represented standard ideas in aeroplane construction, its extreme size being its important feature.

"MARK R. E." BIPLANE (BRITISH). In the spring of 1914 the *Mark R. E.* biplane, the product of the Royal Air Craft factory of Great Britain, was tested with considerable success. This tractor biplane with four propellers is driven by a 120-horsepower Beardmore-Austro-Daimler motor. The letters "R.E." stand for "Reconnaissance Experimental," and were a modification of the "D.E." of Bleriot, an experimental machine also turned out by the Royal Air Craft factory, and a number of which were in use in the British service. This new aeroplane was said to be inherently stable. Colonel Seeley, Secretary of State for War, announced that he had taken part in a demonstration early in May, in the course of which at a height of 2000 feet the pilot abandoned all control of the machine and he himself steered the machine about. The aim in this British military aeroplane in securing additional stability was not so much to make it easier for the pilot, as to economize energy so that he could pay greater attention to observation, and in the event of the observer being incapacitated the pilot could

obtain in large measure the information desired in the reconnaissance.

One of the interesting features of the year was the development of various devices to secure increased stability in aeroplanes. The Sperry Gyroscope, controlling the Dunne machine in which the design and construction produced increasing steadiness, and the automatic control as in the Dautre stabilizer were extensively tried. In some of these the action is automatic, while in others where the pilot attempts to assume control and wishes the machine to respond quickly the action is likely to be sluggish, leading to embarrassment in certain situations.

One of the important constructions of the year was the Burgess-Dunne sea-plane, which made use of the English patents of Lieutenant Dunne, and the experience gained in this field by the Burgess interests of Marblehead, Mass. The principle of the Dunne machine was not new, but the system as worked out provided an increased inherent stability in flight. This sea-plane was efficiently tested at Marblehead on May 2 by representatives of the Aero Club of America and found perfectly satisfactory.

THE SPERRY GYROSCOPIC STABILIZER. This device, invented by Elmer A. Sperry, and used on a Curtiss flying boat in a safety test, on June 18, received the first prize of \$10,000 offered by the French War Department, with a second prize to the Paul Schmitt Aeroplane Company. Lawrence Sperry, the son of the inventor, was pilot, with a mechanic to assist him, and he performed a number of notable feats, standing up in the machine with arms folded and sending his mechanic to the end of the lower plane and back. This apparatus consists of a group of four gyroscopes arranged in two pairs, each pair revolving in opposite directions in order to neutralize the precessional movement. One pair revolves in the plane of symmetry of the aeroplane, and the other in the vertical plane parallel to the span. Each group is contained in a sort of cage, composed of two rings, one horizontal and one vertical. In normal flight these gyroscopes keep the axes of these rings directly horizontal and vertical, so that any dipping of the aeroplane is instantly corrected through the servo-motors, and these servo-motors, it must be understood, by the planes or their valves, control the elevator and ailerons. The levers which act on the valves are attached to the rings above referred to. There is an anemometer which furnishes the pilot with a visible record of speed at any moment, and prevents the machine from rising so speedily that there is danger of its falling back on its tail. This anemometer through its servo-motor blocks the longitudinal control lever, and prevents further climbing when the aeroplane approaches the critical angle, and starts it automatically on a descent, until normal flying speed is regained. It also regulates the action of the gyroscope in turning and controls the angle of inclination with the velocity of the machine. The gyroscopes are electrically driven, and weigh only two pounds each, turning at 12,000 r.p.m., with current from an alternating current dynamo, run from the front end of the motor by a belt, with a battery carried in reserve. The wireless installation can also be operated from the dynamo. Compressed air is obtained from the motor and stored in a tank similar to that used in compressed air self-starters for mo-

tor vehicles. The total weight of the apparatus is about 45 pounds. New devices render the operation of the machine practically automatic, and control can be abandoned by the pilot without affecting the stability of the machine. The ailerons automatically change their angle of incidence and keep the plane on an even keel. With this automatic climbing is possible and the stabilizer works successfully in high winds. With the stabilizer in action, the ordinary means of control are completely blocked, but the direction of the machine can be changed by small supplementary levers. The Sperry gyroscopic control was demonstrated before a committee of the Aero Club of America on December 8th.

COMPETITIONS.

On account of the war aeronautical competitions naturally languished, and over \$1,000,000 worth of prizes were called off. For the first time the Gordon-Bennett aviation race, which would have been started at Buc, France, was called off, and many others that had been arranged were abandoned. Nevertheless, in the first half of the year some important competitions were held, which indicated progress in aviation.

The Monaco Rallye Aerien, which lasted from April 1 to April 15, included a race from seven capitals of Europe to Monaco, and of the 25 competitors entered, 12 participated. Five complete trips were made, and the competition was won by Roland Garros, who made the distance between Monaco and Paris, 1293 kilometers, in 12 hours, 14 minutes, 21 seconds, of which time he was over land 10 hours, 32 minutes, 53 4-5 seconds, and over sea 1 hour, 41 minutes, 27 1-5 seconds. He also made a trip from Brussels to Monaco, a distance of 1293 kilometers, with the flying time of 12 hours, 27 minutes, and 13 seconds, of which time he was over land 10 hours, 7 minutes, and 18 seconds (a record), and over sea 2 hours, 19 minutes, 55 seconds.

PANAMA PACIFIC INTERNATIONAL EXPOSITION AROUND THE WORLD FLIGHT. Previous to the outbreak of the war, prizes of \$150,000 were announced for successful competitors in a race from the Panama Pacific Exposition Grounds in San Francisco, starting May 15, 1915, around the world, to be completed before Dec. 4, 1915. In spite of the question whether conditions would permit of the holding of this race, the regulations proposed are interesting as indicating the conditions and status of long distance aeronautics in 1914. The competitors were to pass over the course in an easterly direction, and were to alight at the various controls designated by the Exposition authorities, where each flyer would submit his log-book and instruments to the officials in charge. Each aircraft was to follow on from one control to the next, but supplies and battery service were to be provided only along what was considered the most feasible route to traverse. The distance between controls must be traversed by the same aeroplane, but a stop could be made anywhere for repairs, even to the extent of installing new motors, and at any control the machine might be abandoned, and another one taken if it were of the same type of air-craft. When the plan was suggested, \$100,000 of the prize money was to go to the flyer finishing first, \$30,000 to the second, \$20,000 to the third, provided the flight was

made within 121 days. If this time is exceeded the first prize would be reduced \$1000 a day for each day over the 121, and a corresponding reduction would be made in the second and third prizes. Deductions were also to be made for aeroplanes which were successful, except as regards the crossing of the Atlantic or Pacific Ocean or any other body of water, and corresponding arrangements for prizes and deductions were to be made for other competitors finishing in order.

The usual important competition over the Prince Henry circuit in Germany was made May 17-25, and 12 competitors out of 40 entries covered the 1800 kilometers course. In the reliability trials for aviators and passengers, the race was won by Lieutenant Von Thüna in a L. V. C. biplane, whose flying time was 17 hours and 16 minutes. An interesting flight of the year was made by Eugene Gilbert in a flight for the Michelin cup in the course, 841 miles in 39 hours, making a tour of France.

Among the few competitions held in the United States during the year was the Fourth of July aviation race at New York, with four contestants, over a 46-mile course, starting and finishing at the Atlantic Yacht Club, Sea Gate, near Coney Island. The race was won by H. Kantner in a Schmitt monoplane fitted with floats and equipped with a 50-horsepower gyroscopic motor. He covered the course in 43 minutes, 26 1-5 seconds, an average speed of over a mile a minute. The second was Albert S. Heinrich in a Heinrich monoplane, equipped with floats and driven by a 50-horsepower Gnome motor. His time was 46 minutes, 46 4-5 seconds for the course.

In England previous to the outbreak of the war several important competitions were held. The London-Manchester-London aeroplane race on July 10 was won by W. L. Brock, an American airman, who thus secured the gold cup of the London *Daily Mail* and \$2000 in cash. He covered the double journey of 322 miles in the actual time of 4 hours, 42 minutes, and 26 seconds, or an average of about 64 miles an hour. He used an 80-horsepower Morane machine, with Gnome motor. In this competition but 3 of the 8 contestants finished. Brock also won the circuit-of-London aeroplane race, 100 miles, in 1 hour, 18 minutes, 14 seconds, on June 20, and the British Aero Derby on July 11. Another triumph was scored by Brock in the London-Paris-London race, where his time for 580 miles was 6 hours, 59 minutes for the round trip, but 14 minutes more than the fastest time by boat and rail from London to Paris. Brock's time was 3 hours, 33 minutes, and 24 seconds, while Garros's record for the round trip was 8 hours, 28 minutes, and 47 seconds. Both aviators flew in 80-horsepower Morane-Saulnier monoplanes.

The Schneider cup for marine flying was competed for at Monaco on April 20, with nine entries from five countries. It was won by C. Howard Pixton, British, in a Sopwith 100-horsepower hydro-biplane, which accomplished 150 nautical miles in 2 hours, 13 3/4 seconds; the second being M. Burri of Switzerland in a F. B. A. flying boat, with a flight of 3 hours, 24 minutes, and 12 seconds.

One of the notable flights of the year was made by the German aviator Boehm, in a standard German Army Albatross biplane, consisting of 1350 miles, in 24 hours and 12 minutes. The

flight lasted until 132 gallons of petrol, the supply carried, had been exhausted, but the aviator himself would have been physically fit for another twelve hours' flight. The machine was driven by a six-cylinder 100-horsepower Mercedes motor, and the record was the culmination of a number of attempts in this direction made during the year. Thus Paulet, in a Caudron aeroplane, April 27, made a flight of 16 hours, 28 minutes' duration, and on June 23, the German aviator Basser in a Rumpler biplane flew all night, a total time of 18 hours, 11 minutes, without stopping. While Basser was in the air another German, Landsmann, went aloft, and being caught in a storm was forced to alight, having made a flight of 17 hours, 17 minutes, but on June 27 he flew over the course from Johannisthal to Schulzendorff, without stopping, for 21 hours, 49 minutes, making a distance of 1900 kilometers. He stopped only when his fuel, consisting of 625 liters (165 gallons) of gasoline, and 50 kilograms (110.2 pounds) of oil were exhausted. Landsmann's machine was an Albatross biplane, which was well used by Boehm in his record flight.

Full, interesting, and complete records for pilot and passenger were made on June 19 by Eugene Renaux at Etampes, France, in a M. Farman biplane. The new records were as follows:

Kilometers	Hours	Minutes
250	21	56
300	50	28
350	18	44
400	47	17
450	15	29
500	43	16

Those from 250 to 400 kilometers took the place of those of Garaix. The others were new records.

In 1914, Garaix, in a Paul Schmitt biplane, made a wonderful series of height records. On March 28 he ascended to a height of 1580 meters (5182.4 feet) with eight passengers, and 150 liters (33 gallons) of gasoline, and 40 liters (8.8 gallons) of oil, making a total useful load of 758 kilograms (1667.6 pounds). The record height was reached in 44 minutes. On March 31 he made a final record of 1590 meters (5215.2 feet) with nine passengers, taking the same amount of gasoline and oil as before, making his useful load 833 kilograms (1832.6 pounds). By July 1, 1914, Paul Schmitt's biplane held the following world's record for height:

Passengers	Meters	Feet
4	3150	(10,332)
5	2250	(7380)
6	1750	(5740)
7	1600	(5248)
8	1580	(5,182.4)
9	1590	(5,215.2)

On April 22, Garaix, with six passengers, broke 27 records for speed, distance, and duration, with two, three, and four passengers, and had 11 new records. The 10-kilometer circuit was covered 11 times in 1 hour, 2 minutes, and 25 3-4 seconds, with a total load of 620 kilograms (1364 pounds), of which 465 were the pilot, 10 ballast, 105 gasoline, and 40 oil. His new records established, with speed, pilot, and six passengers, were as follows: 10 kilometers (6.2 miles), 5 minutes, 35 seconds; 20 kilome-

ters (12.4 miles), 11 minutes, 12½ seconds; 30 kilometers (18.6 miles), 16 minutes, 48½ seconds; 40 kilometers (24.8 miles), 22 minutes, 28½ seconds; 50 kilometers (31 miles), 28 minutes, 5½ seconds; 100 kilometers (62 miles), 56 minutes, 44 seconds. Distance in one half hour: 50 kilometers (31 miles). Distance in one hour: 104.141 kilometers (64.6 miles). Greatest speed: 107.462 kilometers (66.6 miles) per hour. Duration: 1 hour, 2 minutes, 25½ seconds. Total distance: 110 kilometers (68.2 miles).

Garaix also made a notable performance on a Schmitt biplane at Chartres on July 2, carrying three passengers, when he went aloft for a flight of 4 hours, 3 minutes, and 29 seconds' duration.

The following altitude records, made at Vienna, June 21-28, are of interest:

Pilot and one passenger... 6170 meters. Lieut. Beer
Pilot and two passengers... 5440 meters. Lieut. Beer
Pilot and three passengers... 4470 meters. Von Loesl

A new world's record for altitude of over 7500 meters, which was finally corrected to 26,246 feet (4¼ miles), was made at Leipzig on July 4 by Heinrich Oelrichs, thus supplanting the altitude record made at Johannisthal on July 9 by Otto Linnekogel of 6600 meters (21,654 feet).

Among the few records made during the year 1914 in the United States, was one for cross country flight of 365 miles, made by W. C. Robinson, the Wright and Nieuport pilot of Grinnell, Iowa, who flew from Des Moines to Kentland, Ind., in a new monoplane of his own construction. The altitude record for an aviator alone was made on Aug. 6, 1914, by De Lloyd Thompson, who at Overland Park, Kansas City, ascended to a height of 4600 meters (15,256 feet) in a Day tractor having 25 feet spread and 4.4 inches chord, driven by an 80 horsepower gyro-motor. This record, however, was supplanted on October 8 by one made by Capt. L. R. Muller, U. S. A., of the aviation corps, in a new Curtiss tractor, at San Diego. He rose to a height of 17,185 feet, thus making the American record.

DIRIGIBLES.

An interesting feature of the use of a Zeppelin in dropping bombs over Antwerp was the repair to one of its propeller frames, damaged by shocks from a Belgian battery. Although the airship was somewhat 6000 feet in the air, the shock seriously damaged a portion of the frame and interfered with its operation. One of the mechanics in the car climbed out on the injured framework and was able to clear up the damaged parts, and also to repair a long rent in the hull that had been hit by a shell.

On June 20, the Austrian airship *M3* was destroyed with a loss of nine lives, in one of the most sensational accidents ever recorded. This airship, which was of the Körting type, was built in 1911, and was 65 meters (213.25 feet) in length, with a gas capacity of 3600 cubic meters. It went into the air at Fischamand, near Vienna, and was pursued by an aeroplane piloted by Lieutenant Flatz. The latter overtook the airship at a height of about 400 meters (1312.33 feet), and attempting to rise over it, struck the gas bag, causing an explosion and the capsizing of the aeroplane. The airship carried a crew of seven officers, and the men, with the

exception of an engineer, all soldiers, were killed and burned, while Lieutenant Flatz and Lieutenant Puchta of the Austrian navy were killed instantly.

A record of 34 hours in the air was made in the spring by the German Zeppelin *LS* on a voyage from Friedrichshafen to Potsdam. In this trip an average speed of nearly 60 miles was claimed, and while over Heliogoland the *LS* was in communication with the dirigible *LZ24* over Friedrichshafen.

Just previous to the outbreak of the war, the French military dirigible, the *Adjutant Vincenot*, made a new record for continuous navigation by an airship, being in the air 35 hours and 20 minutes, thus eclipsing the record of the German Zeppelin, *LS*, of 34 hours and 59 minutes, made on May 22. The *Adjutant Vincenot* made the trip from Toul, France, to Paris, leaving Toul, June 28, and after covering a wide circuit landing late on the night of June 29.

AEROSTATION.

In ballooning as well as in other branches of aeronautics the effects of the European War were evident. The Gordon-Bennett International Balloon Race, which had been won in 1913 by the American balloon *Goodyear*, and accordingly should have been held in the United States in 1914, was abandoned. This race would have taken place at Kansas City on October 26, but, as with the exception of the United States and Switzerland, the entries were from countries at war, it was impossible to arrange it. In the United States, however, the National Balloon Race was held as usual, and was won as in 1913 by the balloon *Goodyear*, though the distance, 301.82 miles, was considerably shorter than in any previous elimination, the record standing at 914 miles, made in 1912. This competition was held under the auspices of the Aéro Club of St. Louis, Mo., on July 11, 1914; 11 balloons entered, 8 appearing when the meet was held. The heat was intense, in fact sufficient to burst one of the balloons before it could ascend, and to this was due the short distance accomplished. The balloons competing, and other information as regards this race, are summarized below:

Balloon	Pilot	Aide	Landing	Dist.
<i>Goodyear</i>	R. A. D. Preston	M. D. Tremeloin	Near Constance, Ky.	301.82
<i>Pennsylvania, II</i>	A. T. Atherbolt	P. T. Sharpless	Near Rockville, Ind.	174.84
<i>Uncle Sam</i>	P. T. McCullough	W. H. Trefts	Near Lewis, Ind.	171.20
<i>Aéro Club of St. Louis</i>	John Berry	A. Von Hoffman, Jr.	Near Terre Haute, Ind.	167.80
<i>Miss Sophia</i>	W. F. Assmann	(No aide)	Near Flat Rock, Ind.	147.70
<i>America III</i>	Jerome Kingsbury	C. P. Wynne	Near Princeton, Ind.	140.80
<i>San Francisco, 1915</i>	E. S. Watts	Ralph Emerson	Near McLeansboro, Ill.	109.30
<i>Kansas City, II</i>	John Watts	W. F. Comstock	Near Enfield, Ill.	107.40

Previous to the National Balloon Race, an interesting competition was held at Portland, Ore., on June 11, four balloons competing. While the distances made were not great, yet the event indicated the general interest in the spherical balloon, and the accompanying summary is interesting:

Balloon	Pilot	Landing	Time	Miles
<i>Kansas City, III</i>	John Watts	6 miles east of Cascadia	17.10½	82½
<i>Springfield, No. 3</i>	Roy F. Donaldson	At Blue Lake	14.35	43½
<i>Million Population Club</i>	John Berry	2 miles S.W. of Clarke	8.59½	28
<i>Uncle Sam</i>	H. E. Honeywell	¾ mile N.E. Beaver Creek	8.29½	19

Another balloon race arranged somewhat hastily and accompanied by automobiles, was started from Pittsfield, Mass., on October 8. The bal-

loons participating, the names of the aviators and aides, were as follows:

Dancing Doll, A. Leo Stevens and Gordon Bruc; *L'Ecuriel*, Robert Glendenning and Sidney Welsh; *I. C. U.*, Dr. Jerome Kingsbury and W. H. Richardson; *The North Adams*, Allen R. Hawley and Doctor Von Utassy.

The latter was the king balloon, and was the first to ascend. Thirty-five miles was the maximum distance in the flight, and the cup was won by *L'Ecuriel*, of Mr. Glendenning. A cup was also awarded to the automobile which was the first to reach the point of descent of the leading balloon.

The world's distance record for a voyage in a spherical balloon was broken February 8-10 by Hans Berliner, who, with two companions, ascended at Bissersfeld, Russia, and traveled a distance of 1897 miles, thus beating the record of Kaulen in the German balloon *Duisburg*, made on a trip starting Dec. 13, 1913, and aggregating a distance of 1740 miles. The German balloonists on alighting in Russia were arrested for traveling over the country and landing without government permission, and on being found guilty were sentenced to fine and imprisonment.

An important event in American aeronautics was the announcement by the Massachusetts Institute of Technology that it would offer a graduate course in aeronautical engineering under the direction of Prof. Cecil H. Peabody, of the Department of Marine Engineering, and under the general direction of Assistant Naval Constructor J. C. Hunsaker, U. S. N., who had made elaborate investigations and researches in this field, and whose work has been particularly helpful to students of aviation.

During the year 1914 the British Government recognized the validity of the Wright patents obtained for certain features of aeroplanes, and settled with the Wright interests for past and future uses of the devices so protected by the payment of the sum of \$75,000. While this sum was less than was originally claimed, yet the settlement was made so as not to embarrass the government under the war conditions and in its work of manufacture. The settlement carries with it, however, a distinct recognition of the

work of the Wrights as the original inventors in this field.

Had it not been for larger questions raised by the War of 1914 there would have been considerable discussion of legislations and regulations connected with aerial navigation. The Aërial Navigation Act of Great Britain of 1913 was

very specific, containing a number of restricting clauses. New questions were arising in various other countries. One of these was whether aëro

boats should be covered by the rules of the road at sea, and licensed and controlled in the same way as high speed motor boats. It would seem that the time was ripe for some discussion at least, if not for actual legislation in regard to it.

A military and naval competition was held in Great Britain during the year to determine the best and most suitable motors for government use. A prize of £5000 was won by an engine of 100-horsepower with steel cylinders 140 by 152 millimeters (about 5.51 by 5.98 inches), water cooled, with copper jackets and with valves in the head operated by an overhead cam shaft. This engine, which weighed 450 pounds, was constructed by the Green Engine Company. The following eight other firms, whose engines successfully survived a preliminary elimination run of six hours, received £100 each: Argyle, Ltd., Beardmore-Austro-Daimler Engine Company, British Anxani Engine Company, Dudbridge Iron Works Company, Gnome Engine Company, Sunbeam Motor-Car Company, Wolseley Tool and Motor-Car Company.

A military aeroplane competition was scheduled for 1914 by the Signal Corps of the United States army, but was called off in October because the eleven entrants failed to file the necessary plans, specifications, and data, required under the rules, although three machines were on hand. This competition called for the most advanced standards and in case of a tractor biplane demanded a weight carrying capacity of a pilot and passenger of 150 pounds weight, oil and fuel for a four hours' flight, and 450 pounds of dead weight in all tests. The various items and specifications included the construction, workmanship, mechanism, minimum speed in rising and maneuvering, and handling of the machine, the inherent stability, suitability of lighting, gear cleaning, length of run in starting and alighting, and field of vision. The three best machines meeting the requirements of the judges were to have been purchased for \$12,000, \$10,000, and \$8000, respectively. It was considered doubtful whether the condition of climbing 4000 feet in 10 minutes could be met with, the opinion being held that it could be done only by a machine of at least 100-horsepower with a revolving cylinder motor. The three machines which appeared for test were supplied with water-cooled motors of the 8-cylinder V-type. One of these with an 85-horsepower motor flew with a speed variation of 45 miles per hour, and afterwards, when piloted by Lieut. H. L. Muller, made a height record of 17,440 feet, when going a distance of 130 miles, carrying 3 persons, on September 26. The two other machines, each of which was equipped with a 100-horsepower motor, flew from San Diego to Los Angeles.

During the year the United States Navy Department requested information of eight American manufacturers of balloons and aeronautical apparatus in reference to supplying the United States with dirigibles, considering at that time the purchase of at least two of a minimum displacement of at least 75,000 cubic feet. These manufacturers were asked to submit estimates for supplying one or more airships of the various types that had been used in Europe and could be manufactured in this country, and also for two airships of such a type, and a third estimate for two airships of different types. It was proposed to use any airships purchased under special conditions for training an adequate per-

sonnel, and gaining experience for future developments in this field. The necessary appropriation was available, and the Navy Department was anxious to secure dirigibles of large size, and not such small dirigibles as previously had been in use by the army, which were not to be considered seriously in view of modern conditions.

AEROPLANE. See AERONAUTICS.

AFGHANISTAN. A central Asian monarchy, practically under British domination, and having foreign relations only with the British-Indian government. Capital, Kabul, with about 70,000 inhabitants. The total area is estimated at about 225,000 square miles, and the population at about 5,000,000. The inhabitants are turbulent tribesmen, belonging mostly to the Sunni sect of the Mohammedans. They engage in grazing and agriculture. Cereals, lentils, fruits, live animals, raw wool, silk, carpets, and camels'-hair goods constitute the bulk of the exports, commerce being chiefly with India and Bokhara. In 1913 the imports from India were valued at £1,666,000, and the exports to India at £848,000. The imports from Bokhara are stated as 4,000,000 roubles, and the exports at an equal amount. The loosely organized government is headed by an ameer (Habibullah Khan in 1914), who receives an annual subsidy of 1,800,000 rupees from the British-Indian government. Other revenues, the amount of which cannot be determined, are derived mainly from taxes in kind, and their collection is attained with dishonesty and extortion.

In the autumn of 1914 the ameer of Afghanistan was reported to have placed himself at the head of an army for the invasion of India. Such an act of hostility towards the British Empire might mean the end of Afghan independence, should Great Britain issue victoriously from the War of the Nations; but it is quite possible that the report of the ameer's bellicose action was quite unfounded in fact.

AFRICA. See articles on the various African countries; **ANTHROPOLOGY**; **ARCHÆOLOGY**; and **EXPLORATION**.

AFRICAN METHODIST EPISCOPAL CHURCH. See **METHODISTS**, **COLORED**.

AGRICULTURAL BANKS. See **AGRICULTURAL CREDIT**; and **BANKS AND BANKING**.

AGRICULTURAL CREDIT. The great interest in the provision of facilities for farmers which had been aroused by various factors during the past few years approached the stage of practical action in 1914. Various phases of the problem were considered early in the year at a joint meeting in Chicago of the National Conference on Marketing and Farm Credits, and the Western Economic Society. There resulted a permanent organization to carry on the work throughout the year. On November 23-25, inclusive, at a conference of Progressive State Granges in Washington, the subject of rural credit legislation was thoroughly discussed. The Federal Reserve Board and the banks extended credit to the cotton growers toward the end of the year through the *Cotton Loan Fund*. (See **BANKS AND BANKING**.) In his annual report in December, Secretary of Agriculture Houston considered further extensions of credit by Government aid unnecessary, believing that the formation of rural credit associations among farmers and privately capitalized agricultural banks

should be able to meet all demands not met by the new Federal Reserve System.

AMERICAN COMMISSION. In 1913 the American Commission of nearly 100 members studied agricultural credit methods in Europe. In addition President Wilson appointed a commission of seven, authorized by Congress and known as the Federal Commission on Rural Credits, to study the same problem. These two commissions coöperated. A report in three parts was submitted to Congress in March. This report analyzed the needs of farmers for both large and small sums for long and short periods. It recommended that long term loans of considerable size with which to purchase farms and equipment be treated separately from short term small loans for running expenses while crops are maturing. It surveyed European plans of providing credit.

CONGRESS. Following these inquiries numerous bills were introduced in Congress. Representative Moss, of Indiana, in January introduced a bill for the establishment of National Land Banks under the supervision of a special bureau of the Treasury Department. These banks, according to the bill, could be either private joint stock or coöperative associations. They would have power to accept and pay interest on deposits, including postal savings; to make loans on farm lands for not more than 35 years up to 50 per cent of the value of improved lands, and 40 per cent of the value of unimproved lands, such loans to be reduced by annual or semi-annual payments, and to be made only to pay off mortgages or purchase land. Each of these banks was expected to contribute to the capital of a Federal bank.

There was introduced on May 12 the Rural Credit Bill by Representative Bulkeley and Senator Hollis. This was in the main the Administration measure designed to carry out a policy forecast in the Federal Reserve Act of 1913. It provided for the creation of local farm loan associations by any five persons; these could be established by the payment of capital stock by outside investors or by a group of borrowers desiring to form such an organization and borrow from it. Above these local associations were to be twelve Federal land banks of \$5,000,000 capital each. Each local association was to contribute at least \$1,000 to the capital of the Federal land bank. The Federal land banks were to derive their capital from investors, the government, and local associations. The farm loan association would make loans for 30 years in amounts not exceeding 20 times their capital and surplus and based on farm mortgages. Such loans would be on an amortization basis making possible the gradual reduction of the principal from year to year. The Federal land banks would perform the function of transforming the farm mortgages into bonds in denominations of \$100 and more and selling these latter to investors. Although designed as the Administration measure, President Wilson finally entered an objection to it because of a section which authorized the Secretary of the Treasury to purchase farm loan bonds up to \$50,000,000 in amount. The President disapproved this extension of governmental aid and security.

Other bills dealing with the same matter were the Fletcher bill, the Fletcher-Moss bill, and the Bathrick bill. The Fletcher bills were similar in general principles to the Bulkeley-Hollis

bill, except they provided for the formation of National Farm Land banks under the immediate direction of a commissioner in the Treasury Department without the formation of local farm loan societies. The Bathrick bill provided for loans direct from Government to farmers or district farm credit associations at a rate not to exceed $4\frac{1}{2}$ per cent. The Government was to borrow such funds at not over $3\frac{1}{2}$ per cent and distribute them under the direction of the Secretary of Agriculture.

OHIO. The Ohio members of the American Commission previously referred to issued *Report on Rural Credits and Coöperation* (84 pp.). This report dealt not only with agricultural conditions and methods in Europe but gave data regarding investigations by Ohio State departments into the extent of farm loans in that State. It was shown that State and private banks had on Sept. 4, 1913, outstanding farm loans amounting to \$25,455,000. Building and loan associations had 7,737 such loans amounting to \$15,223,000. The census of 1910 had reported mortgage indebtedness of \$63,788,000 on 12,785 out of 44,780 farms operated by owners owning their entire farms. Of farms partly owned 10,217 or 35 per cent were mortgaged with total indebtedness of \$15,000,000. If to these sums were added the mortgages of farms operated by managers or by tenants a total of \$103,000,000 was secured. This was undoubtedly a minimum since an estimate based on recorded mortgages in 1913 indicated a total mortgage indebtedness on Ohio farms of \$175,000,000 to \$200,000,000. At the minimum figure banking institutions would provide two-fifths of mortgage loans, the remainder coming from individual lenders, insurance companies, and banks outside of the State. No data were available to indicate the extent of short-time loans on personal or chattel mortgage security. Loans to tenant farmers moreover were shown to be at least well provided for.

TEXAS. Professor L. H. Haney of the University of Texas found as the result of the study of the farm credit conditions in that State that tenant farmers were paying an average of 20 per cent interest; and that the credit system injured diversification of crops to a very marked degree. He pointed out that bad years put many tenant farmers hopelessly in debt. They then financed their farming by mortgaging the next year's crop, seldom receiving more than 50 per cent of the estimated value of such crop. The merchant advancing the loan usually requires that cotton be the main crop. This system destroys the initiative and hopefulness of the farmer; and fastens more securely upon the South the single-crop system with its soil exhaustion. The extraordinary interest rate implying a great scarcity of capital results in inadequate equipment in live stock and machinery. Thus the available labor force cannot be utilized to its greatest efficiency.

CANADA. The Province of Saskatchewan appointed in 1913 a Commission to Inquire into the Ways and Means of Establishing Agricultural Credit. It joined with the American Commission already noted in investigating European systems of rural credit. It also made an extensive investigation into mortgages and farm loans in Saskatchewan. It found that during 15 months preceding Aug. 15, 1913, there was an average of 115 mortgage foreclosures and

other mortgage proceedings per month in the Province; that interest rates on mortgages were seldom less than 8 per cent and in many cases were 10 per cent and 12 per cent and occasionally reached 15 per cent. While mortgages were almost universally for short terms, they were readily renewable, the farmer thus being periodically threatened with the loss of his farm. The purposes for which loans on mortgages were made included: past debts; machinery; stock, building, and equipment; working capital; more land; and travel. The Commission found that while the banks rendered many services, they made excessive charges and favored the commercial rather than the agricultural interests. It was found that not less than \$65,000,000 was due to mortgage companies from Saskatchewan farmers. Other large sums were owed to implement companies and for preëmtions, horses, store credit, lumber, and miscellaneous debts, so that farmers of the Province were paying interest on at least \$150,000,000. Thus a reduction in the interest rate by 2 per cent would effect a substantial saving. The Commission held strongly that farm credit should be provided on an amortization plan and under conditions in which service to the farmer rather than profit is the chief aim. The Commission would create a coöperative farm mortgage association with local branches to issue mortgage bonds granted by the government; mortgage loans to be issued to farmers on a 15 to 35 year basis at a rate of interest covering actual cost.

AGRICULTURAL EDUCATION. The passage during the year of the Agricultural Extension Act rounds out and completes the movement for agricultural education inaugurated in 1862 with the passage of the land-grant act for the establishment of agricultural colleges. It provides for a form of extra-mural instruction which has developed out of the work of the agricultural colleges, and in many States already been started by them, and it recognizes these colleges as the agencies in which such work should centre. The object of the new act, named for its authors the Smith-Lever Act, is "to aid in diffusing among the people of the United States useful and practical information on subjects relating to agriculture and home economics, and to encourage the application of the same;" and in general the work contemplated is defined to consist of "the giving of instruction and practical demonstrations in agriculture and home economics to persons not attending or resident in said colleges in the several communities, and imparting to such persons information on said subjects through field demonstrations, publications, and otherwise."

The appropriations are assigned to the agricultural colleges in the respective States, and the work is to be conducted in coöperation with the United States Department of Agriculture, the latter being charged with the administration of the act. The act carries a permanent appropriation of \$480,000 per annum for maintenance, or \$10,000 for each State. In addition, \$600,000 is provided for the second fiscal year of operation, and thereafter an amount increasing each year by \$500,000 over the preceding year, until in seven years it reaches \$4,100,000.

This with the basic appropriation of \$480,000 makes a total of \$4,580,000, and continues as a permanent annual appropriation. Unlike the initial appropriation of \$480,000, these additional appropriations are to be allotted annually by the Secretary of Agriculture to the several States in the proportion which their rural population bears to the total rural population. They are also conditional upon the provision by the States of an equal sum for maintenance of the work, so that when the act matures a total of \$8,680,000 will be available for extension work under its provisions. No part of the appropriation can be used in the purchase, erection, or repair of buildings, the purchase or rental of land, college course teaching, promoting agricultural trains, or other purposes not specifically authorized, and not more than 5 per cent for the printing and distribution of publications.

Extension divisions or departments have been organized at each of the agricultural colleges, and the new work inaugurated. These colleges now embrace three main divisions—research under the experiment station, college instruction, and extension.

During the past decade the number of students taking the full four-year course in agriculture at the land-grant colleges has increased from approximately 2500 to 12,500. Since 1910 the annual number of graduates in agriculture has increased from 708 to 1384, and the number receiving advanced degrees from 74 to 164. The total revenues of the land-grant colleges have practically tripled and those of the experiment stations have more than tripled, the increase being especially notable from sources other than Federal funds. Similarly, the number of men on the staffs of the experiment stations has increased from about 750 to approximately 1600, and the number of these doing no teaching from 375 to 925.

Ten years ago there was scarcely any agricultural extension work performed outside of the work carried on by the farmers' institutes. Today practically all of the land-grant colleges have a definite organization for extension purposes, with 1300 men employed as State, district, and county agents, and as boys' and girls' club workers.

In the New York State College of Agriculture there has been established a third, or summer term, which continues from early June until late September. It is coördinate with the present fall and spring terms. It is open only to students who have completed the required work of the freshmen and sophomore years in agriculture or the substantial equivalent thereof. The facilities of the college are available for graduate study throughout the summer.

An extensive investigation of the Massachusetts Agricultural College has been made by the State Commission on Economy and Efficiency. One outcome of this was its recommendation that the system of annual State appropriations for maintenance be supplanted by appropriations for a five-year period, totaling \$1,611,000, or an average of \$322,000 per year.

GRADUATE SCHOOL OF AGRICULTURE. The sixth session of the Graduate School of Agriculture was held at the University of Missouri, June 29 to July 24, Dr. A. C. True of the United States Office of Experiment Stations serving as dean. The instruction offered related especially

to genetics, agronomy, horticulture, animal husbandry, immunity and disease resistance in plants and animals, and rural economics and sociology, including farm management.

SECONDARY AGRICULTURAL SCHOOLS. According to the most reliable information, there were in 1913-14 about 103 agricultural high schools in the United States receiving State aid, six privately endowed agricultural high schools, 424 public high schools receiving State aid for agriculture, 563 high schools in which instruction in agriculture is a requisite for State aid to high schools, and 330 high schools in which instruction in agriculture is a requisite for State aid for normal training instruction, or a total of 1426 high schools. There were also 215 normal schools, including county training schools and industrial schools for women, offering courses in agriculture.

The State of Michigan is one of a few States that has made considerable progress in secondary agricultural education without State aid. A recent report from that State shows that 31 high schools offered one or more years of agricultural work during the past year. Each school employed a special instructor in agriculture, nine of whom were employed for 12 months; 1000 boys studied agriculture in the different grades, and 356 young women were also enrolled in certain of the agricultural subjects; approximately 500 of the high school boys and girls worked at home projects during the summer of 1914; the cost of agricultural instruction per school ranged from \$175 to \$1300, or a total of \$20,884.50; 17 schools offered one-week courses for farmers and 16 had a total of 31 boys' and girls' clubs; the expense of equipment ranged from \$1.50 to \$225 per school, or a total of \$1253.

The State of Minnesota may be mentioned as the one State that is foremost in providing State aid for the teaching of agriculture in secondary schools. It is shown that for the year ended July 31, 1914, 119 State high schools received a total State aid of \$237,853 for instruction in agriculture; agriculture was taught in 134 high schools to 4053 students, cooking in 165 high schools to 5799 students, and sewing in 179 high schools to 6680 students; the total expenditure for agricultural equipment was \$40,558, and for cooking and sewing equipment \$55,144.

Progress was made by the United States Office of Experiment Stations in the preparation of literature to be used by teachers giving instruction in agriculture in the rural elementary schools. A definite beginning was also made in the preparation of illustrative material for use in agricultural schools, including charts, photographs, lantern slides, moving picture films, etc.

FOREIGN COUNTRIES. *Chile.* The agricultural normal school at Santiago is being reorganized and its activities devoted entirely to agricultural subjects under rules and regulations to be issued by executive authority. The agricultural schools at Chillán, Concepción, and Cauquenes are also to be reorganized, and \$10,950 has been appropriated for each of two agricultural schools to be established at Aconcagua and Rancagua, respectively.

Canada. An act has been passed providing for the establishment of agricultural schools at such places in the Province of New Brunswick as may be decided upon by the lieutenant-governor in council, who is also authorized to pur-

chase such lands and erect such buildings as he may deem necessary for the purpose.

The plan, under which the department of education of the Province of Ontario is coöperating with the department of agriculture to encourage instruction in agriculture and horticulture in continuation and high schools and collegiate institutes, has been worked out in detail. The instruction will be optional, under the supervision of the director of agricultural education, and will be given by teachers of science holding an intermediate certificate in agriculture and horticulture granted upon the satisfactory completion of two five-weeks' summer sessions at the Ontario Agricultural College, or by the district agricultural representatives. A board of trustees that provides and maintains satisfactorily a course in agriculture and horticulture in the lower school of the high school course extending over two years, including pupils' home projects under a certificated teacher, will receive \$100 and the teacher \$75. To the school board which, in addition to the home projects, provides and maintains experimental and demonstration plats at or in connection with the school for the practical instruction of the pupils, an additional grant not to exceed \$25 will be paid, and to the teacher an additional annual grant of \$25. When the work is conducted by a county agricultural representative he will be paid the grants specified for the teacher. The two-year middle school course may be taken only in schools where the lower school course is being taken. The same grants will be paid and the same requirements as regards instruction and examinations made as in the lower school course.

Colombia. The government of Cundinamarca has contracted with a proprietor of vineyards at Tocainia to establish an agricultural institute on his property. The Colombian Government has also authorized the employment of four instructors in tropical agriculture and two veterinarians.

Bolivia. The Elidoro Villazon National Agronomic and Veterinary Institute at Cochabamba is now well equipped and furnishes a four-year course of theoretical and practical instruction in agronomy and veterinary science. An agricultural school is being established at Ypacarai, Paraguay, with several instructors educated abroad.

Peru. A three-year theoretical and practical course in agriculture is now being offered in the Peruvian National College at Ica, and a new school is to be established at Puno, the Peruvian port on Lake Titicaca.

AGRICULTURAL EXPERIMENT STATIONS. **EXTENSION OF THE WORK.** There has been a steady growth of the stations generally throughout the United States. The States have shown an increasing tendency to extend the work of the stations by making appropriations for investigations in special lines. In California a station has been established for the study of problems connected with the growing of citrus fruits and a laboratory costing \$25,000 has been erected at Riverside. The new hydraulic laboratory at the Colorado Station has been used for important studies of the devices for measuring water for irrigation. In Idaho, State appropriations aggregating \$16,000 were made for investigations in animal husbandry, poultry, orchard irrigation and the control of the alfalfa weevil. The Kentucky Station erected a special

building for the breeding and rearing of guinea pigs, rabbits, mice, and other small animals used in its researches. In Missouri, State appropriations amounting to \$48,000 were made for work in animal and dairy husbandry, horticulture, farm management, and soil test fields, in addition to \$55,000 for general maintenance and new equipment. The New York Cornell Station has a special appropriation for the study of diseases of gladioli and other bulbous plants. The South Dakota Station has \$25,000 for the collection and introduction of Siberian alfalfas and the propagation and distribution of hardy varieties of this plant in the semi-arid regions of the State. In West Virginia the station received from the State \$17,000 for work in animal husbandry, horticulture and tobacco and \$4500 for printing. In Iowa recent legislation gives the station \$40,000 for maintenance, \$10,000 for veterinary investigation and \$19,500 for the purchase and equipment of an experiment farm.

New greenhouses and service buildings, costing about \$87,000, have been erected at the Illinois Station. The State appropriations for the Minnesota Station have been increased by \$40,000. In Kansas \$68,000 was appropriated for the maintenance of the station and substations. The Maine Station had \$5000 for animal husbandry investigations and \$10,000 for the purchase of an experiment farm in Aroostook Co. Agricultural buildings for the use of the colleges and stations have been erected as follows: In Arizona, \$165,000; Massachusetts, \$210,000; Washington, \$150,000; Wyoming, \$100,000; Michigan (dairy building), \$50,000; New York, at Cornell University (animal husbandry building), \$91,000, and (soils building), \$100,000.

FEDERAL AND STATE STATIONS. Agricultural experiment stations maintained in whole or in part by Federal funds in 1914 existed in every State and Territory, including Alaska, Hawaii, Porto Rico and Guam. There were also stations in the Philippines under the insular government. In 1913 the stations employed 1639 persons in the work of administration and inquiry. The total income of the stations maintained under the Acts of Congress of 1887 and 1906 was \$4,387,635, of which \$1,440,000 was received from the United States, \$1,504,133 from State appropriations, and \$1,407,502 from fees, contributions, sale of products, and miscellaneous sources. The value of the additions to station equipment aggregated \$731,430, of which \$395,137 was for buildings. In addition to this, the Office of Experiment Stations had an appropriation of \$431,700, including \$30,000 each for Alaska, Hawaii, and Porto Rico; \$15,000 for the Guam Station; \$16,000 for nutrition investigations; \$98,300 for irrigation investigations; \$100,000 for drainage investigations; and \$15,700 for investigations of farmers' institutes and agricultural schools, together with \$28,660 derived from the sale of agricultural products at the insular experiment stations.

In Alabama, Connecticut, Hawaii, Louisiana, Missouri, New Jersey, New York, North Carolina, and Virginia, separate stations were maintained wholly or in part with State funds and numerous substations were also maintained in a number of States. Excluding the substations the total number of stations in the United States is 65, of which 58 receive Federal funds.

In 1913 the stations published 624 annual reports, bulletins and circulars, which were supplied to over 1,000,000 addressees on the regular mailing lists. The correspondence with farmers was enormous and constantly increasing.

OFFICE OF EXPERIMENT STATIONS. This office continued to maintain close relations with the stations in the several States, conducted an inspection of their work and expenditures under the Hatch and Adams funds, and published summaries of the work of the stations and other similar institutions throughout the world in the *Experiment Station Record*. The advisory functions of the office are increasing constantly with the growth in the amount and variety of the station enterprises.

RECENT EXPERIMENTS. The *South Dakota Station* demonstrated the possibility of growing sugar-beet seed of the highest quality in South Dakota and by selection increased the percentage of sugar in the beet in one strain to 25.4 per cent, and also successfully adapted the tobacco planter to the use of setting out alfalfa plants in rows in order to admit of their cultivation, which is largely practiced in the dry region of the State and elsewhere.

The *Missouri Station* secured data giving a basis for applying the feeding standard more accurately to cows producing milk varying widely in fat content. Results of feeding studies indicated that, under the conditions of the experiment, and estimated on the basis of net profit per steer, a ton of dry matter in the form of corn silage yielded 50.3 per cent greater value than a ton of dry matter in the form of shocked corn.

The *Idaho Station* secured results showing that the amount of acid present in the cream at the time of churning is the principal controlling factor in the deterioration of butter in storage and that this is not due to the action of bacteria, yeasts, or molds developing in the butter subsequent to its manufacture.

The *Wisconsin Station* worked out methods of making Cheddar and brick cheese from pasteurized milk with the results showing higher scores in quality as well as a gain in the yield of the cheese.

Along veterinary lines the *North Dakota Station* established the importance of nonclinical infection carriers as factors in the maintenance of swamp fever infection foci, and demonstrated the tenacity of swamp fever virus in infection carriers.

The *Rhode Island Station*, in further pursuing its fowl cholera studies, demonstrated the transformation of an inherited, acquired immunity in rabbits into a permanent, active immunity, and discovered a culture possessing a protective action against a number of virulent fowl cholera cultures.

The studies of bacillary white diarrhea at the *Connecticut Storrs Station* have proved that the period of great danger of infection from without is the first three days after hatching, or the first four or five days if vitality of the chicks is low. The feeding of sour milk as a means of reducing loss through the disease was well demonstrated.

The etiological factor causing contagious abortion in cows, *Abortus bacillus Bang*, was isolated by the *Kentucky Station* from three herds affected with the disease, and a biological test was devised whereby contagious abortion in cows

may be accurately diagnosed. The organism causing this disease in mares was also isolated by the station and identified as different from the micro-organism causing the disease in cows.

In studying the availability of phosphates the *Wisconsin Station* determined that, contrary to the general belief, aluminum and iron phosphates are relatively unavailable to plants. Many of the common field crops made better growth on aluminum phosphate than on calcium phosphate, and better growth on iron phosphate of the ferrie form. The results show the inadequacy of chemical solvents in measuring the availability of different phosphates. This station also found that such plants as June grass and red clover contain volatile sulphur compounds, and that with an adequate supply of sulphates in the soil an abundance of sulphates was produced in the plant juice and maximum growth was attained.

The *Iowa Station* demonstrated that frozen soils possess a nitrogen-fixing power which increases with the continuance of the frozen period, being independent of moderate changes in the moisture conditions, but restricted by large decreases in moisture. It is explained that in the fall when the soil gradually cools, its nitrogen-fixing power increases until the soil becomes frozen when it almost ceases, after which a smaller nitrogen-fixing power is established. In studies involving the relation between soil bacteria and the growth of various crops by the *Wisconsin Station*, it was found that when pure cultures of various kinds of soil bacteria were grown in extracts from marsh soil which had previously produced corn, oats, or clover, the bacterial development in all cases was increased, the stimulation being greatest after corn, thus indicating the possibility that the growth of a given crop may favor the multiplication of certain kinds of bacteria affecting the growth of subsequent crops.

Work at the *Minnesota Station* on physiological races and the nature of resistance in plants showed that the resistance offered by wheat to the attacks of *Puccinia graminis* appears to be of the same nature as that offered by a given cereal to an uncongenial biologic form. Resistance further was apparently due not to morphological but to physiological causes and was found to vary somewhat with the metabolism of the host.

Investigations in farm management were pursued by a number of these institutions, and such work at the *Missouri Station* indicated that in the particular field of study about 17 per cent of man labor on the farm went to maintenance, 28 per cent to crop production, and 56 per cent to other production, while horse labor varied from 6 to 21 per cent for maintenance, 51 to 69 per cent for crop production, and 19 to 41 per cent for other production.

In *Alaska* several hundred hybrid strawberry plants fruited for the first time at the *Sitka Station* and one matured its fruit 10 days earlier than any native or cultivated variety. Crossing experiments are being made with wild and cultivated currants and gooseberries, as well as the berries belonging to the genus *Rubus*. At the *Rampart Station* Grimm alfalfa seeded abundantly. The possibility of producing locally grown seed of turnips, radishes, peas, and other vegetables was also demonstrated there. At Kodiak experiments showed the practicability of

revegetating the land covered by ash from Mount Katmai and the Galloway cattle have been returned to the reservations on that island. Wherever nitrogen was added to the volcanic ash or the lower soil was mixed with it excellent crops were grown. A plow was devised which will mix the ash and soil.

At the *Hawaii Station* the soil investigations have given results of great practical value. Phosphoric acid was found to be fixed by Hawaiian soils to a greater extent than any other fertilizer constituent, but it continues available for plants. A variety of rice, *Bezambo*, from Japan, matures fully 10 days earlier than other varieties grown at the station. Cultivating soy beans as a green manure crop in connection with rice has nearly doubled the yield of the latter crop. The Mediterranean fruit fly has been found to attack coffee while the berries are yet on the trees, but earlier picking will give a better flavored coffee with little loss due to the fly. Some recent experiments have indicated that cold storage will destroy the fruit fly in avocados, papayas, figs, etc., if the fruit is kept 10 days or more at 32° F. Coöperative marketing experiments have proved very successful and encouraged the farmers on the islands to produce more vegetables, fruit, poultry, eggs, etc.

In *Porto Rico* the station is conducting a survey of the island to determine which sections are best adapted to fruit growing and in other ways special attention is being given to work in the interests of this rapidly expanding industry. Experiments with mangoes, coffee, coconuts, cacao, and vanilla are being extended. Coffee diseases and insects are being studied. Investigations in agriculture have led to the development of a considerable industry.

In *Guam* experiments in the introduction of improved breeds of horses, cattle, pigs, and chickens have been quite successful.

In *England* a laboratory for research in agricultural entomology has been opened at the University of Manchester. In South *Russia* an experiment station for pomology known as the *Salghir Station* has been established at Simpheropol in the Crimea. At Allahabad, *India*, the American Presbyterian Mission is acquiring land for experimental work in agriculture in connection with the Ewing Christian College. This enterprise will be in charge of an American missionary who has introduced many important improvements in agricultural methods among the native farmers.

AGRICULTURAL LEGISLATION. UNITED STATES. Agricultural measures received considerable attention from Congress and the relatively few State legislatures in session in 1914. The leading enactment was the Smith-Lever Act establishing a national system of agricultural extension work. (See AGRICULTURAL EDUCATION.) Valuable results were also expected from the United States Cotton Futures Act. This measure attempts to minimize speculative manipulation of the market by requiring in sales of cotton on the exchanges for future delivery the use of official grades, written contracts, and a system based on actual commercial values in making settlements, with an appeal to the United States Department of Agriculture in case of disputes. A tax of two cents a pound is levied on all cotton not so sold, and as the very low grades of cotton and pro forma deliveries are prohibited and the Department of Agriculture

will determine what are bona fide spot markets, it is expected that market quotations will reflect more accurately the real value of spot cotton of usable quality, and thereby assist both the grower and manufacturer.

The serious financial situation confronting producers of cotton and certain other crops following the outbreak of the European War led to many relief propositions involving Federal and State aid in a variety of forms, but no legislation was completed. In South Carolina a law was passed restricting the planting of cotton to one-third of the acreage in all crops the preceding year. A bill designed to increase the value of warehouse receipts as security for loans by providing an optional system of Federal licensing of warehouses and grading of cotton, grain, and other nonperishable agricultural products passed the Senate August 24, and in considerably modified form the House December 21, but had not been finally adopted at the close of the year.

Although the commissions appointed in 1913 to study European rural credit methods submitted comprehensive reports, an increasing realization of the complexities of the subject and of the wide differences of opinion as to the most feasible remedies contributed to the postponement of all Federal legislation. New York, however, authorized a system of land banks, consisting of local savings and loan associations conducted on the usual basis, but supplemented by a central State bank located in New York City and owned exclusively by them. This central bank may issue shares to the locals, using the proceeds for loans on real estate, and can also sell bonds secured by long-term mortgages. In Colorado a court decision affirmed the constitutionality of an act providing for the use of nearly \$1,000,000 of school funds for long-term farm loans at 6 per cent interest. Virginia modified its incorporation laws to facilitate the formation of bona fide cooperative associations, and Massachusetts amended its credit union law of 1909.

Conservancy districts were authorized in Ohio to reclaim wet lands, provide irrigation, or prevent floods; and drainage districts may now be established in New York. Mississippi, New Jersey, South Carolina, and Virginia amended their drainage code, and the Massachusetts drainage board was empowered to purchase and drain lands for sale at cost plus 4 per cent interest. Lime crushing plants may be operated at the Mississippi State penitentiary, and the lime sold to farmers at cost.

A food and market commission was established in New York and a market division in Hawaii. (See *Marketing and Distribution*.) In Maryland, municipalities were prohibited from charging farmers for licenses to sell their own produce. New Jersey cities were empowered to operate public slaughter houses, the city of Providence, R. I., a public market, and Jamestown, N. Y., a municipal milk plant.

The milk laws of Massachusetts, New Jersey, and Rhode Island were made considerably more stringent. In Virginia the prompt cleansing of milk cans was required, and optional tuberculin testing of dairy stock provided, with State remuneration for diseased animals. South Carolina passed a seed inspection law, and Maryland adopted amendments requiring statements as to purity and germination. New York provided

for the registration of agents selling nursery stock, and the recovery of damages for trees which do not prove true to name. South Carolina prohibited misleading claims for proprietary stock feeds, and Virginia the dissemination of the rust disease by cedars. Both of these States amended their fertilizer inspection laws. New Jersey adopted a standard fruit basket and cranberry barrel.

A Federal commission on national aid to vocational education submitted a draft of a proposed bill carrying an ultimate annual Federal expenditure of \$3,000,000 for grants to States duplicating their respective allotments for secondary instruction in agriculture, and the matter was pending in Congress. Virginia authorized the use of State school funds for instruction in agriculture and home economics, and Missouri granted State aid to high schools with approved agricultural courses and instructors. Massachusetts towns were empowered to buy land and otherwise support farm demonstration work, and each county not maintaining State-aided vocational schools may grant funds to a corporation organized for the employment of farm advisers. Virginia provided that county farms may be used for demonstration work, and Mississippi that county supervisors may establish departments of home economics under the direction of a county agent.

Other legislation of the year included an act whereby the Secretary of the Interior may reserve in each Federal reclamation project not to exceed 20 acres per township for country parks, public playgrounds, and community centres. Massachusetts gave farmers the long-sought rights to kill deer injuring crops and detain "chicken thieves." Maryland opened, in connection with its board of immigration, an exhibition room for farm products and an agricultural labor employment office.

FOREIGN. Efforts to promote agriculture by governmental aid were by no means restricted to the United States. Portugal, Peru, and Algeria effected a complete reorganization of their agricultural departments. France reorganized its meteorological service, and Greece and Uruguay provided increased facilities for collecting agricultural statistics. Ontario made formal provision for its system of farm advisers. Turkey, Italy, Spain, and Switzerland adopted laws for the reporting of plant diseases and their control by government inspectors. Egypt took steps to keep out cotton pests, and Norway prohibited importations of gooseberry plants and their products. Quebec and Japan excluded all infected plants and the former provided for nursery inspection. Nova Scotia strengthened its plant inspection laws and Manitoba began the suppression of foul brood. Fertilizer inspection laws became effective in Algeria and Tasmania, while Queensland regulated the size and labeling of its packages of export fruit. The stallion registration laws of Manitoba, Ontario, and Nova Scotia were amended, in the first-named by requiring inspection for soundness.

The Slaughter-of-Animals Act of Great Britain gave authority to the Board of Agriculture and Fisheries to restrict the slaughter of animals used for human food. It was announced that no action was regarded as necessary at present, the object being to prevent the depletion of breeding stock in emergencies. The tuberculosis laws were also strengthened. Ontario

aided the pure bred stock industry by penalizing owners of bulls running at large.

Widespread interest was again manifested in promoting farmers' coöperative associations, rural credit facilities, and similar enterprises. France extended the powers of its rural credit societies, and Madagascar and Mauritius enacted comprehensive laws in aid of rural coöperative organizations. Nova Scotia, Saskatchewan, and Quebec broadened the scope of bodies of this sort. The acquisition of small holdings by laborers through State loans on an amortization basis was facilitated in Denmark by additional legislation.

A system of agricultural warehouses for the reception of farm produce and the distribution of implements, fertilizers, etc., was inaugurated in Portugal. Rumania provided for more complete government inspection of its grain and other markets. Prussia, Hungary, and Madagascar codified and extended their laws relative to the use of waters in irrigation, drainage, and the like.

AGRICULTURE. In the United States the year 1914 was notable for producing the highest total value of crops and animal products on farms ever recorded in the country's history, estimated at \$9,872,936,000. The wheat crop was the largest on record, approximately 891,000,000 bushels. The cotton crop was the second largest ever grown, and the crops of oats, barley, rye, potatoes, tobacco, and hay were unusually large. The corn production was about 10.6 per cent larger than in 1913. The total production of six leading cereals was estimated at approximately 5,000,000,000 bushels, or nearly a half billion bushels in excess of 1913. The apple crop was the greatest ever harvested. For the country as a whole the crop yields per acre were 2.3 per cent better than the average for 10 years.

An official estimate places the Canadian wheat crop at 158,223,000 bushels, or about one and one-half million bushels below last year. Statistics regarding European crops have been difficult to obtain, owing to the war, and are less complete and final than usual at the close of the year. Deficient yields of wheat as compared with 1913 were reported from France, Prussia, Italy, Rumania, Belgium, Denmark, and Switzerland. The aggregate shortage in the world crop of wheat for 1914 as compared with 1913, for all countries heard from, was indicated to be over 386,000,000 bushels, that in Europe alone amounting to 323,000,000 bushels. The shortage in Germany is offset to the extent of about one half by the surplus in rye production.

New South Wales this year had a record area in wheat, estimated at 4,108,615 acres, an increase of nearly 350,000 acres over last year. Of this it was anticipated that 3,556,000 acres would be cut for grain and the remainder used for hay. In Australia it is reported that only 30,000 square miles are being used for wheat, which could be increased by 500,000 square miles, raising the wheat production from about 100,000,000 bushels to 1,000,000,000 bushels.

The Philippine Bureau of Agriculture, in an effort to improve and increase the yield of rice, distributed seeds to over 1000 farmers, including both upland and lowland varieties. The seed distributed was of varieties which for five years had given an average of over 70 bushels an acre. The government is also making an effort to substitute corn for rice as an article

of food among the people of the islands, the Bureau of Education being engaged in a campaign of teaching the people how to grow and use this crop. As a result, in the past two years there has been a marked increase in corn production. In 1912 the crop amounted to approximately 8,000,000 bushels, and in 1913 to 15,000,000 bushels, with a value of \$12,300,000. The Philippine Bureau of Agriculture has started a campaign for the raising of more food crops, made necessary by the European war and the cutting off of rice importation from the countries affected. In recent years the rise of the copra industry and the better markets for hemp and sugar have led to the production of these crops at the expense of the local food supply. The Bureau of Agriculture is working with the coöperation of the recently formed agricultural societies, 21 in number in as many provinces.

The final forecast for the 1914 jute crop of India is 3,358,737 acres, which has only been exceeded by that in 1907-08, and a production of 10,531,505 bales of 400 pounds each—a record yield and an increase of over a million and a half bales as compared with 1913. The normal average consumption of the world is about 10,000,000 bales, but owing to the war it is estimated that the world requirement will fall short of the supply by about 2,000,000 bales.

CROP PRODUCTION AND REQUIREMENTS. The requirements of wheat for food in the United States during the 1914-15 crop year are estimated at about 525,000,000 bushels, and for seeding at approximately 77,000,000 bushels, making a total of 602,000,000 bushels, and showing a surplus of 290,000,000 bushels over the estimated production. Usually only a small quantity is fed to live stock, and this will be kept down by the price in excess of corn. It is concluded, therefore, that most of the 290,000,000 bushels surplus will be available for exportation. This would exceed the export of any previous year, the largest amount (including flour) being 235,000,000 bushels in 1901. Already the wheat export is making new high records, exceeding that reached at a corresponding period in any previous year.

The United States Department of Agriculture has recently published figures for the per capita wheat consumption of various countries during the past decade. Excluding seed and reducing flour to the wheat equivalent, the data are as follows: Canada 9.5 bushels, Belgium 8.3, France 7.9, Spain 6.1, United Kingdom 6.0, Switzerland 6.0, Australia 5.5, Italy 5.4, United States 5.3, Uruguay 5.3, Argentina 5.2, Bulgaria 5.0, Austria-Hungary 4.3, Netherlands 4.2, Rumania 4.0, Denmark 3.5, Chili 3.4, Germany 3.2, Russia 2.7, Servia 2.5, Sweden 2.5, Egypt 2.5, Portugal 1.8, British India 0.8, Mexico 0.8, and Japan 0.5 bushels. Generally speaking, these figures are thought to be less than 10 per cent in error.

A recent investigation of the proportion of the total crop requirements produced by various countries indicates that England produces 53 per cent of her food requirements, Belgium 57, Germany 88, France 92, Austria-Hungary 98, and Russia 110 per cent. Canada produces 23 per cent more than she consumes and Argentina 48 per cent more. Contrary to popular impression, the United States in recent years has been as large an importer of food stuffs as an ex-

porter, and hence cannot be classed as a surplus producer, considering food products as a whole. In edible grains the production in the United States is 23 per cent more than the amount retained, in meat 6 per cent, and in dairy products 20 per cent; but only 24 per cent of the sugar required is produced at home, practically none of the tea and coffee, and 6 per cent less than is used of fruits and nuts.

The quantity of edible grains exported from Canada equals 129 per cent of the amount retained, of meat 8 per cent, and of dairy products 12 per cent. The country most dependent upon importation from foreign countries is the United Kingdom, which produces only 27 per cent of her food requirement of edible grains, but 53 per cent of her meats, 62 of dairy products, 58 of her poultry, more than 90 of her vegetables, and 21 per cent of her fruits. Germany produces about 82 per cent of the edible grains required (including flour), about 93 per cent of meats, 92 of dairy products, 67 of poultry, 99 of vegetables, 48 of fruits, and exports 77 per cent as much sugar as she consumes. France produces about 93 per cent of her edible grain requirements, 98 per cent of meats, 80 of poultry, 91 of sugar, and slightly more than is consumed of dairy products, vegetables and fruits. Austria-Hungary is almost self-sustaining in food supplies; she is a fairly large exporter of sugar and a large importer of coffee, but in most other food products the imports and exports nearly balance. Russia is a surplus producer of food stuffs, exporting 19 per cent of her production of edible grains; the exports of dairy products equal about 10 per cent of the home requirement, of poultry 19, of vegetables 4, and of sugar 33 per cent.

CONSERVATION OF FOOD SUPPLIES. Measures were early adopted in various European countries after the outbreak of the war to economize the supply of food crops and to encourage planting on a liberal scale. Notably in Germany, the matter has been the subject of various governmental actions. The feeding of wheat and rye to live stock in that country was prohibited, and the attention of farmers was called to various kinds of coarse fodders and leaves for bedding which it was urged should be used for their live stock in place of oats and straw, in order that the latter might be saved for the use of the army. The amount of grain used for distilling was restricted to 60 per cent of the normal amount, and mills were permitted to convert a larger percentage of grain into flour, 10 per cent of rye being allowed as an admixture of wheat flour, and 20 per cent of potato flour added to rye flour. Early in the fall an order was issued in Germany directing that all potatoes be thoroughly dug, leaving no tubers in the ground, and that the tops be dried or ensiled for feed. All tubers of doubtful keeping quality were directed to be dried at once, and the drying establishments were required to operate day and night. Large quantities of potatoes were required to be dried for food, and it was advised that potatoes be mixed with grain flour in making bread. To offset the wheat shortage would require the use of about 100 kilograms of potatoes per capita.

In Great Britain the great importance was impressed upon the farmers "in the national interest" of largely increasing the acreage under wheat during the coming season. A proposal

to hold out a financial inducement to that end was considered but not thought justified. An act was passed empowering the Board of Agriculture to regulate and restrict the slaughter of animals used for human food, in order to prevent depletion of the home meat supply and insure the maintenance of a sufficient breeding stock. Under this act it has been directed that the slaughter of immature or breeding stock of every description be avoided, and that where circumstances permit the total head of live stock be increased, particularly animals like pigs which mature quickly. At the same time, the strictest economy and foresight are urged in feeding, using the cheapest efficient forms of food and allowing no waste spaces capable of producing food for animals. The exportation of wheat and of feeding stuffs for animals is generally forbidden by the countries at war.

ECONOMICS OF FARMING. Very many of the largest and most vital questions of farming centre, not merely in the means of improving production, but in the economic phases of the industry. This is seen to apply in determining the desirability of increased production, the type of farming to be followed, and the disposition of the large staples. The cotton crisis in the Southern States has called sharp attention to the errors of too narrow specialization. The Secretary of Agriculture points out in his annual report that too exclusive devotion to a single crop anywhere is unwise for normal times, and brings disaster in times of disturbance; it prevents the full utilization of land and labor, fails to fill the gaps in the work schedule, and furnishes no reserve. "No Southern State," he says, "is giving sufficient attention to the production of foodstuffs, either for human beings or for live stock. A conservative estimate indicates that Texas imports from other States annually more than \$50,000,000 worth of wheat, corn, and oats; Georgia more than \$24,000,000; South Carolina more than \$20,000,000; 12 Southern States import more than \$175,000,000 worth of these three commodities and \$48,000,000 worth of meats, dairy products, and poultry products. . . . If the farmers in the South had heretofore practiced diversification on a sufficiently large scale, producing their own home supplies, that section would not be in its present hard case."

Similarly, a commission reporting the past year on the grain markets of the Province of Saskatchewan concluded that exclusive grain raising in that country, as practiced by even the best farmers, is not remunerative; and recommended that every possible encouragement be given to bring about great diversity in the products of the farms. The commission finds that it costs the farmers more to have the exportable surplus grain of Western Canada placed on the present ultimate market than the farmers of any other large exporting country have to pay; and it holds that all elevators, terminal, transfer, and for internal storage, should be owned and operated by the Dominion Government, and in addition provision made for the storage of grain on the farms.

There has been much popular discussion of the responsibility of the farmer for high prices, through his failure to make his acres more productive; and it has been assumed that large yields are always profitable, and that the best farmer is the one who raises the most per acre.

The fallacy or half truth of this has been brought out by economic studies of the question, which take account of the present transition stage between the extensive farming of the new world and the intensive methods of the old countries. Production per acre is not the American standard but rather the amount of produce for each person engaged in agriculture, and by this test the American farmer is said to be from two to six times as efficient as most of his competitors. Relatively speaking, extensive farming is still regarded as economically the sound programme in American agriculture, for the country is only just emerging from the pioneer stage in which land had little value and labor was the principal element in the cost of production. Land is now growing more scarce, and hence costly, and virgin conditions are rapidly passing away, so that other elements than labor have begun to enter into the cost of production. As a general rule increased yield means greater cost, not only per acre but per bushel; and the question in intensified agriculture is not how much the farmer can produce per acre but how much he can afford to produce, which in turn depends upon the price of the product. Extreme yields are profitable only with high prices, even with the best farmers; hence the yield per acre cannot be recklessly increased.

Dean Davenport, of the University of Illinois, has called attention to the law of diminishing returns in agriculture, and applied it to show the danger of overcapitalization in attempts to secure abnormally high yields. "We have not yet reached the intensive stage where it will pay either the producer or the consumer to attempt maximum yields on American land," and hence "we are not to step at once and blindly into expensive forms of intensive agriculture." However, present yields are below what the climate and general situation ought to produce, owing to certain adverse conditions which can be easily corrected by the use of lime, fertilizers, better seed, more rational culture, etc. By relatively inexpensive methods belonging to a transition stage, the yield may be increased without seriously raising the cost.

Until recently there have been few data on the cost of production, the economics of different kinds of farming as a business, and the cause of success or failure. Such data are being provided by farm management studies and surveys. These surveys are showing the disadvantages farmers labor under, the small returns they receive for their labor and investment, and some practical means of improvement. They have furnished cumulative evidence that modern machinery, with the use of more horses and fewer men, has made the farm of less than 100 acres an inefficient unit in the Central West. One of the latest of these studies, published during the year, relates to representative areas in the corn belt, Indiana, Illinois, and Iowa (*U. S. Dept. Agr. Bul. 41*). Seven hundred farms were studied, in regions where the soil is rich, with ample rainfall. The average labor income of farm owners was found to be \$408 a year, and of tenants \$870, in addition to house and the farm products used in the home. The landlords received an average of 3.5 per cent on their investment.

Dr. Warren, of Cornell, as a result of his studies, believes that for general farming the farms as at present laid out are now too small,

and that with the proper number of horses to operate machinery and make the labor efficient, 160 to 200 acres are required for efficiency in general farming. This means four horses and usually two men most of the time. He points out that while the average American farmer is making interest on his capital and fair wages for his labor, the interest is not high enough to attract any large amount of money from the cities and the wages are not high enough to cause any large number of men to move from the city to the country; but with the broader outlook the prospects are keeping far more boys on the farms.

From an investigation of wheat production on a large scale in Argentina, in the southern part of the Province of Buenos Aires, the statistical department of the Ministry of Agriculture finds the cost to amount to 66 cents a bushel, including the rent of land and interest on investment. The wheat sold for 80 cents a bushel.

MARKETING AND DISTRIBUTION. The work of the Department of Agriculture in this field, started last year, has been greatly expanded and extended. Congress has increased the appropriation for the purpose from \$50,000 to \$200,000. The studies already conducted show a lack of system and economy in getting products from the producer to the consumer. For example, hogs raised in Illinois and sold in Indianapolis were found to be slaughtered at Boston, and a part of the cured bacon shipped to Los Angeles; while Michigan dressed veal was shipped by express to commission houses in Chicago and then returned to the identical shipping points from which it came for local retail consumption.

Coöperative selling has received special attention and records have been obtained of more than 8500 marketing associations, about 2700 coöperative and farmers' elevators, 2500 coöperative and farmers' creameries, and more than 1000 coöperative fruit and produce associations. Over a billion dollars' worth of agricultural products are reported to be marketed annually in the United States by coöperative and farmers' associations. The establishment of standards or uniform methods of grading for agricultural products protects the farmer from injustice, affords incentive to him to improve the quality, and insures the consumer in securing the exact commodity for which he pays a specific price. A few years ago the Department proposed standard grades for cotton, which are being widely adopted, and during the past year Congress enacted a Cotton Futures Act (see **AGRICULTURAL LEGISLATION**), which stipulates that future contracts must be based on these standards. Grades for commercial corn were promulgated during the year, and work is in progress in fixing commercial grades of grains, especially wheat.

The official grading of Manila hemp and other fibre products in the Philippines has been provided for by a law passed by the insular legislature, effective Jan. 1, 1915. The grading of these fibres is to be done only in establishments licensed by the director of agriculture. Inspection of the grading and an accompanying certificate are provided for. It has been recognized that some such protection of the hemp producing interests and the good name of Philippine hemp and other fibres was necessary.

A committee of wool growers, which met in conference at Washington during the year, presented a report in which it called attention to

the absence in the United States of any generally accepted standards for the determination of the various grades of wool. This makes it impossible for the wool grower to know the grade of wool he is producing or its value in the market. The preparation of wool standards by the Department of Agriculture was strongly urged.

A new marketing bureau has been established in New York State, to find a profitable market for farm products of the State and devise an economic system of distribution. The fact that New York City is not only a great consumer but a great distributing centre leads to the pouring into that city of immense quantities of food, which gives great opportunity for fixing prices believed to be unwarranted by the law of supply and demand. The building up of local markets throughout the State, so that home grown products may be delivered directly to their final destination, is one of the remedies contemplated. While similar bureaus exist in several other States, notably Wisconsin and Minnesota, the New York bureau is organized on a broader and more effective basis.

The parcel post has served to bring producer and consumer closer together by favoring direct buying and selling; and the Post Office Department has used its efforts to popularize such dealing, through instruction in packing, exhibits at agricultural fairs, and the publication of lists of farmers prepared to supply various products. The volume of this business has been enormously increased during the year. The standardizing of products has been found one of the essential things in parcel post marketing.

RURAL CREDIT. The United States and American commissions on coöperation and rural credit, which spent several months in Europe in 1913 studying coöperative and land mortgage banks, rural credit unions, and similar organizations, presented the results of these studies for publication. The material collected by the American commission was issued as a Senate document of over 900 pages, entitled "Agricultural Coöperation and Rural Credit in Europe" (*U. S. Senate, 63d Cong., 1st Sess., Doc. 214*). The United States commission prepared a careful analysis of its findings, with modifications necessary to meet American conditions. The report dealt with land mortgage or long term credit, and personal or short term credit, and was published in a document entitled "Agricultural Credit" (*U. S. Senate, 63d Cong., 2d Sess., Doc. 380*). The commission also framed a bill to provide for the establishment, operation, and supervision of a national farm land bank system, which was introduced in the Senate. Various other measures have been advanced, but none of these has passed Congress. The National Grange has been active in urging legislation, and in the fall took steps to organize a rural credit league for that purpose.

Provision has been made for the organization of a State land bank in New York, under a new State law. (See **AGRICULTURAL LEGISLATION**.) In the Philippines, arrangements have been made whereby the government will deposit with the Bank of the Philippine Islands \$1,000,000 to be loaned to farmers in all parts of the islands at not more than 8 per cent interest. It is hoped that this will serve to bring down the prevailing rate of interest. A coöperative farm mortgage association act was recently passed in Saskatchewan, enabling farmers to obtain loans at low

rates by giving a government guaranty to bonds or debentures issued by an association of farmers, so that these bonds may be placed in the money markets of the world. An added advantage is the opportunity of repaying a loan at any time under easy conditions.

AGRICULTURAL EXTENSION. A matter of vast importance was the passage by the U. S. Congress of an act providing for the instruction and aid of farmers through field demonstrations, advice, personal contact, the diffusion of information, etc. (See **AGRICULTURAL EDUCATION**.) This measure is one of the most striking educational measures ever adopted by any government. It is an attempt to carry to the men and women working at their daily tasks on the farm the teachings of better agriculture and homemaking, and to extend leadership to them and to their organizations. Various forms of extension work have been carried on by the agricultural colleges in several of the States, and the Department of Agriculture has for several years been conducting demonstration work with farmers, frequently in coöperation with the agricultural colleges. As developed, this demonstration work has taken the form of providing county agricultural agents, usually with the coöperation of the county, who spend their time out among the farmers, supervising demonstration trials on their lands, holding meetings, giving personal advice, promoting organization and coöperation, and otherwise stimulating the agriculture of the county. The range of service of these county agents is very wide, including the introduction of better breeding animals, testing of cattle for tuberculosis, vaccination of hogs against cholera, development of local supplies of lime, testing seeds, inducing farmers to try new crops, organization of clubs, holding short courses, establishment of reading courses, introduction of agriculture in the local rural schools, directing boys to the agricultural college, and many other kinds of assistance.

For the past year the Department had available considerably over a million dollars for this purpose, and this sum was generously supplemented by State, county, and local contributions. The new extension act is coöperative, and under it the Department will join hands with the States in conducting this work, centering it in each State at the agricultural college. The ultimate aim is an agricultural agent in every county, aided by experts from the agricultural colleges and special officers for organizing and conducting boys' and girls' clubs, etc. The work has met with great popularity and success, and promises to be a great power for the development of the industry.

LAND, AGRICULTURAL AND WASTE. Considerable attention has been given of late to the area of waste or uncultivated land in various countries, as indicating the opportunity for agricultural development. The presidential address of Mr. A. D. Hall before the agricultural section of the British Association for the Advancement of Science, at its 1914 meeting in Australia, dealt specifically with this subject. He made the surprising statement that within 50 miles of London blocks of a thousand acres of waste land may be found, while Belgium and Holland have large districts that are little more than desert. Germany possesses something approaching ten million acres of uncultivated land, and a government department has been created to reclaim

and colonize it. Mr. Hall outlined many of the methods which modern science has developed for improving such land. See SOILS.

Only 27 per cent of the tillable land of continental United States is actually under cultivation, according to estimates published during the year by the Department of Agriculture. Of the total area of continental United States, 60 per cent, or 1,140,000,000 acres, is estimated to be tillable, i.e. capable of being brought under the plow. This includes areas which may in future be subdued by clearing, drainage, irrigation, etc. An additional 19 per cent, or 361,000,000 acres, is considered valuable for pasturage and fruits, although nontillable. This leaves only 21 per cent, or 399,000,000 acres, of no use to agriculture, present or future. According to the last census, the land area in crops was 311,000,000 acres, equivalent to about 27 per cent of the estimated potential tillable area of the nation, excluding foreign possessions. In other words, for every 100 acres now tillable, about 375 acres may be tilled when the country is fully developed. The undeveloped areas lie mostly in certain Western States, the largest amount in the Eastern States being in Florida. Naturally the land most easily brought into a state of cultivation, as in the great Mississippi Valley, was the first to be taken up; extension of tilled areas will be at greater expense for improvement.

In Belgium a special commission on the cultivation of waste land reported early in 1914, estimating that there are more than a quarter of a million acres which might be brought under cultivation, exclusive of land which might be rendered more productive by improvement, especially by drainage. Drainage is advocated for reclaiming waste land, with governmental aid and encouragement. Data collected for the new land valuation in France and published during the year show that 65.28 per cent of the entire land area, exclusive of that occupied by buildings, is under cultivation or in pasture, 19 per cent in forest, alder, willow, and similar plantations, and less than 15 per cent in heath, swamp, and other waste land. The latter, however, aggregates nearly 18,000,000 acres. The arable land increased from 1851 to 1879 by nearly a million acres, after which it decreased so that it is now 2½ million acres less than in 1851, although the area in meadows and pastures increased nearly 5,000,000 acres during that time. Both capital value and rental of land increased considerably from 1851 to 1879, after which they sank to nearly the same level as in 1851 (or about 33 per cent), attributed not to a decrease of the gross returns, but to the net returns from agricultural produce.

Extensive and far-reaching land reforms are in progress in Russia under a law promulgated in 1906. The work has only developed on an extensive scale in the last few years, and is connected in its origin with the law of 1861 abolishing serfdom, adding to the personal emancipation of that law the liberation of land. One portion of the work has to do with the readjustment and redistribution of lands owned or occupied by peasants, in order to unite the scattered holdings of individuals, or their equivalent, in small farms of a single piece. Some 11,000 persons are directly engaged in this enterprise, which is the most extensive land readjustment ever undertaken.

Another feature concerns itself with provid-

ing additional land for peasants, who in general are insufficiently supplied. The latter has been conducted in close collaboration with the peasants' land bank, which not only makes long-time loans to purchasers, but is authorized to purchase landed estates by the issue of bonds, for subdivision and resale to peasants, and has had placed at its disposal large areas of crown land for the same purpose. The disposal of the enormous quantity of land which came into the bank's possession has involved the organization of schemes of home colonization, the moving of peasants to new sections where land is more abundant, and other measures. In spite of the difficulties of such a large undertaking, the principal part of the land reserve of the bank has already passed into the hands of peasants, especially small farmers most in need of it.

A report issued by the Argentine Ministry of Agriculture shows an extensive changing hands of land. Excluding the land which cannot be sold, the sales during the past decade equal more than 50 per cent of all the Argentine territory.

The last Canadian census showed that out of a total of 710,681 farms, 186,988 were under 50 acres in size, 162,537 were between 50 and 100 acres, 228,236 were between 100 and 200 acres, and 132,920 were over 200 acres. The Board of Agriculture has published a detailed classification of agricultural holdings in England and Wales, according to size. About one-third of the agricultural area of the country is farmed in holdings of from 50 to 150 acres, rather more than half in holdings of over 150 acres, and about one-fourth in holdings of over 300 acres. Nearly one-half the total number of holdings are from 1 to 20 acres, but in area they represent only 6 per cent of the whole. From 1895 to 1913 the total cultivated area declined by over a half million acres, largely at the expense of the largest holdings.

Up to the close of 1913, 182,022 acres of land had been acquired under the British Small Holdings Act, and land had been provided in 6 years for 17,000 applicants. This, however, does not begin to meet the demand, for 43,245 individuals and 89 associations have made application in that time for small holdings which would aggregate 723,497 acres. Less than 2 per cent of the applicants desire to purchase holdings. A new small holdings law was passed in Denmark during 1914, which modifies the law in force since 1899. It aims to facilitate by means of government loans the acquisition of small holdings by farm laborers and similar persons in the country districts.

A successful experiment in reclamation has been made in Egypt on an 800-acre tract of waste land so badly impregnated with alkali that it had grown nothing in years. In 1912 it was drained and irrigated at a cost of \$50 an acre. In 1913 it was flooded to wash out the alkali and a crop of rice was grown. The past year a considerable proportion was successfully used for cotton growing, producing a good crop. It is stated that there are a million and a half acres of similar waste land awaiting development in the Nile delta.

The National Forward-to-the-Land League has been planning a meeting in New York early in January, 1915, with the support of the Department of Labor, the U. S. Reclamation Service, and other government agencies, as well as pub-

lic-spirited men. It aims at settling on the now unutilized land adapted to agriculture the needy from the cities and such desirable immigrants as may come to this country after the war. Several of the States, notably Georgia and California, have set organized effort on foot to attract Belgian settlers. The State-wide organization in Georgia announces that it will provide farm lands practically rent free for two years, and an effort will also be made to furnish transportation and farming equipment.

MOVEMENT OF FARMERS. An analysis of the data collected by the last U. S. Census from nearly 6,000,000 farm operators shows that approximately 52 per cent had occupied their farms less than 5 years, while more than 1,000,000 farmers, or $\frac{1}{6}$ of the entire number, had been in their present location less than 1 year. Only 8.63 per cent of "owners, free," in the United States are reported as having occupied their farms for a year or less, while 52.27 per cent of "share tenants" were in the one-year class, and only 6 per cent of the latter had a tenancy of 10 years or over.

FARM WOMEN. To ascertain the specific needs of farm women for assistance, a letter of inquiry was addressed last year by the U. S. Department of Agriculture to the housewives of 55,000 progressive farmers in all the counties of the United States. No questions were asked, but the women were left to discuss any needs they felt. The replies have now been digested and are being summarized in a series of reports published by the Department, together with references to what the government has done in the various lines. These reports deal with the social, educational, domestic, and economic needs of farm women.

The Minister of Agriculture of France has authorized the directors of the departmental agricultural services to organize farm women's clubs in as many communities as possible, for the dissemination of information in home economics and agriculture. The clubs of each department are to be federated, and these departmental federations combined into a national federation, to be administered by a central committee at the seat of the Ministry of Agriculture. A national union of women's agricultural associations in Prussia was formed in Berlin in February, 1914. The object is the creation of a centre for the work of the provincial unions, especially in relation to the teaching of domestic science, increasing the productivity of the rural domestic industries by organizing the sale of fresh products in towns, the promotion of fruit growing, market gardening, bee and poultry keeping, and the control of immigration from the country.

RADIO-ACTIVITY AND PLANT GROWTH. The effect of radio-active material on plant growth has lately attracted attention and study. Stoklasa and Zdobnický found that in moderate concentration radio-active emanations favorably influenced the development of grains and legumes, and their total production. Very heavy concentrations, however, checked development and appeared to favor the formation of toxic substances. Similarly, Petit in France found a striking acceleration of growth in rye grass, wheat, and especially corn. In the United States, Dr. H. H. Rusby, of Columbia University College of Pharmacy, reported experiments with the finely powdered residue remaining after the

extraction of radium. These experiments were conducted in greenhouses and fields, on a larger scale than most of the previous experiments. They showed that in the case of most crops the yields were increased by the addition of the radio-active material, the amount differing with different crops. The beneficial effects continued from one crop to another. There was no indication that radium serves as a plant food, for the necessity for fertilizer was but little decreased. Experiments in England with similar material gave good results with cereals, and especially with root crops.

OFFICIAL AND PERSONAL. Hon. Carl Vrooman was appointed Assistant Secretary of Agriculture to succeed Dr. B. T. Galloway, who retired during the summer to become Director of the New York State College of Agriculture and Experiment Station.

Dr. Moises S. Bertoní, an experienced agronomist and botanist, and director of the agricultural station at Asunción, Paraguay, has been appointed chief of the Bureau of Agriculture in that country.

A separate Ministry of Agriculture has been provided in the Union of South Africa, the first appointee being Hon. H. C. von Heerden.

The trustees of the estate of the late H. B. Noble, of Douglas, Isle of Man, have decided to devote \$100,000 to the fostering of agriculture in that island. It is planned to establish a board of agriculture, additional funds to be contributed by the island.

The legislative assembly in the Bahamas has provided for an agricultural board, which has been appointed by the Governor. Attention is being given to the improvement of breeding stock, and the establishment of a government agricultural loan bank is being advocated.

The Russian budget for 1913 contains an estimated expenditure for agricultural purposes of £16,638,600, an increase of £2,335,500 over 1912. The largest item, £5,300,000, is for land organization and allotment, and assistance to peasants in districts where this work is in progress. There is an allotment of £1,178,700 for drainage, irrigation, and peat cutting, and the allotments for agricultural education and for horse breeding are largely increased.

The Swedish budget for 1914 carried a total of £592,000 for agriculture, an increase of £22,000, mainly for veterinary education and improved roads.

An association of the chambers of commerce and agriculture in the Republic of Mexico has been provided, the aim being to give uniform direction to the agriculture and commerce of the country.

Interest of the railroads in improving agriculture has extended to Spain, where one road has provided its stations with small agricultural museums, supplied with various kinds of useful information; and demonstration fields have been established near many of the railway stations by the central experiment station service of Madrid, with lectures on the use of fertilizers.

Dr. William Saunders, a notable pioneer in the field of Canadian agricultural investigation, and the originator and for many years director of the system of Canadian Experimental Farms, died September 13. He was born in England in 1836, and came to Canada at an early age. His special field of work was horticulture and economic entomology, and he did notable work in

cereal breeding. In 1882 he published *Insecta Injurious to Fruit*, a book which was widely used as a text in American agricultural colleges.

Dr. Francis H. Storer, one of the few remaining pioneers in agricultural chemistry in the United States, died July 30. His agricultural work, beginning in 1871, was carried on at Bussey Institution of Harvard University, of which he was for many years dean. He was the author of a standard treatise entitled *Agriculture in Some of Its Relations with Chemistry*, which first appeared in 1887, and ran through seven editions, being twice revised. He retired in 1907.

Sir Walter Gilbey of England, noted horse breeder, founder of the Shire Horse Society, and active in the establishment of the Hackney Horse Society, died at Elsenham Hall, Essex, November 12, at the age of 83 years.

Mr. F. W. Taylor, director of agriculture in the Philippine Islands, has been succeeded by Mr. H. T. Edwards, for many years connected with the Bureau of Agriculture.

The National Geographic Society awarded a medal in honor of the late Prof. F. H. King, of the University of Wisconsin, for his well-known investigations on Chinese agriculture.

CONGRESSES AND ASSOCIATIONS. The fifth International Congress of Rice Culture met at Valencia, Spain, May 10-24. It was divided into eight sections, dealing with such topics as rice varieties and their improvement, manures, culture, machinery, rice diseases, the rice trade, co-operation, and the relations of rice growing and malaria.

The German Agricultural Society held its 1914 exposition at Hanover in June. Coincident with it, the 150th jubilee of the Royal Agricultural Society of Hanover was celebrated. This is one of the oldest and most notable agricultural societies in the German Empire, having been founded in Celle in 1764, moved to Hanover in 1878, and since 1899 united with the Royal Chamber of Commerce for the Province of Hanover. A large volume was issued in commemoration of the jubilee.

The Australian meeting of the section of agriculture of the British Association for the Advancement of Science, held during the summer of 1914, was of unusual interest. The sessions were devoted to the subjects of irrigation, dry farming, animal breeding, and milk supply, selected for their local importance.

A section of agriculture was established in the American Association for the Advancement of Science, Dr. L. H. Bailey, of New York, being elected its first vice-president. The new section was inaugurated at the Philadelphia meeting of the association at the close of the year.

A conference of persons interested in the wool industry met in Washington in January, on call of the Secretary of Agriculture. The needs of the sheep and wool industry and plans for placing it on a more stable basis were considered.

A gathering of much interest was the Conference on Country Life Development, at Louisville, Ky., April 7-10, the general expenses of which were defrayed by the Southern Education Board. The main object was to devise ways and means to organize and build up country life in the South, and the sessions were widely attended.

The first International Phytopathological Conference convened at Rome, February 24 to March 5, under the auspices of the International Insti-

tute of Agriculture. Fifty delegates were present, representing 35 countries. The chief purpose was to secure measures in each country to prevent the dissemination of diseases and insects affecting plants, especially the organization of an effective system of nursery inspection.

The fifth annual Corn Exposition was held at Dallas, Texas, February 10-24; and the ninth International Dry Farming Congress at Wichita, Kan., in October.

The secretary of the Patrons of Husbandry announced that 518 local granges were added to the roll during the year. Of these 390 were new, and 28 were reorganized from the remnants of previous orders. The spread of the order into the far West is a notable feature of the steady growth.

	1913	3,760,000	1,495,000	90,829

a Tons. b Pounds. c Bales of 500 pounds gross weight.

MINERAL PRODUCTION. In 1913 Alabama ranked eighteenth among all the States in the value of its mineral products, and second among the States south of Mason and Dixon's line and Ohio River. The iron ore produced in 1913 was 5,333,218 long tons, valued at \$6,648,569, compared with 4,776,545 long tons, valued at \$5,734,371, in 1912. Nearly four-fifths of the total value of mineral products was contributed by iron. The iron making industry is centred in Birmingham and vicinity. Large quantities of pig iron are manufactured and the marketed production of pig iron in 1913 was 1,924,762 long tons, valued at \$23,242,374, a slight decrease in quantity from 1912, but an increase in value of nearly \$2,000,000. The value of the pig iron is not included in the total value of the mineral products given below. The coke production in 1913 was 3,323,664 short tons, valued at \$9,627,170, compared with 2,975,489 tons, valued at \$8,098,412 in 1912. The increase in the production of iron ore and in the manufacture of coke with the decreased sales of pig iron,

indicate that some of the ore and of the coke was sent to furnaces outside the State. There were produced in 1913, 17,678,522 short tons of coal, valued at \$23,083,724, compared with 16,100,800 tons, valued at \$20,829,252 in 1912. The principal coal-producing counties are Jefferson, Walker, Bibb, and Tuscaloosa. The coal production for 1914, according to estimates of the United States Geological Survey, was between 12,500,000 and 15,000,000 short tons. The markets for Alabama coal were affected by the low price of petroleum in the Southwestern States; by increased water-power developments; by the competition of coal from Kentucky and Illinois in the markets of Louisiana and Mississippi, which are normally supplied by Alabama; and by other causes. The clay-working industries in 1913 yielded products valued at \$2,091,581, compared with a value of \$1,935,179 in 1912. The principal part of this was from the manufacture of common brick. The quarry products, the larger part of which is limestone, were valued in 1913 at \$1,285,944, an increase of more than 50 per cent from the value of the product of 1912. Other mineral products are graphite, mineral waters, and silver. The total value of the mineral production in 1913, exclusive of pig iron, was \$34,680,545, compared with \$30,641,983 in 1912. Approximately two-thirds of this was represented by the output of the coal mines.

EDUCATION. The total number of school children in the State in 1914 was 774,976, of whom 432,551 were white, and 342,425 colored. Of the white children, 330,057 were literate and 51,184 illiterate, while among the colored children the ratio was 42,187 literate to 109,975 illiterate. The total enrollment in 1913-14 in the elementary and grammar school grades was 451,850, of whom 305,248 were white and 146,602 were colored. In the high school grades, exclusive of county high schools, there were enrolled 15,094, of whom 1210 were colored. The average daily attendance in the elementary and grammar schools was 276,647, of whom 185,472 were white, and 91,175 were colored. The total number of schools was 6753, there being 4727 for white children, and 2026 for colored, in which were employed 10,038 teachers, of whom 7522 were white, and 2516 colored. The total number of school houses was 6689, with a value of \$7,675,386, the schools for colored children numbering 1941 with a value of \$666,850. The average yearly salary of white male teachers was \$445, and of colored male teachers \$169, while the average for female teachers was \$369 for white, and \$153 for colored. The total disbursements for educational purposes in 1914 amounted to \$4,446,076.

FINANCE. The receipts for the fiscal year ending Sept. 30, 1914, amounted to \$6,607,001. The disbursements for the same period amounted to \$6,575,969. At the beginning of the fiscal year there was in the treasury a balance of \$99,267, and at the end \$130,299. The bonded debt of the State at the end of the fiscal year 1914 was \$9,057,000. It consisted of bonds and special debt obligations to public trust funds. The per capita debt was reduced from \$9.80 in 1880 to \$5.65 in 1912.

CHARITIES AND CORRECTIONS. The institutions under the control of the State include the insane hospitals at Tuscaloosa and Mt. Vernon, the Confederate Soldiers' Home at Mountain

Creek, Alabama Industrial School for White Boys at East Lake, Industrial School for White Girls, State schools for the Deaf and Blind at Lineville, Alabama Home for Refuge, Reform School for Juvenile Negro Law Breakers, and School for the Negro Deaf and Blind. The charitable and correctional institutions are not under the direct supervision of any State board.

POLITICS AND GOVERNMENT. There was no meeting of the State Legislature in 1914, as the sessions are quadrennial and the last was held in 1911. The campaign for the election of a United States Senator to succeed Joseph F. Johnston, who died in 1913, was begun. In October of that year, Oscar W. Underwood, the Democratic leader of the House of Representatives, announced himself a candidate for the nomination. Richmond P. Hobson had previous to this time offered himself as a candidate, begun a campaign, and in the closing months of 1913 spent the greater part of his time in active canvass throughout the State. He also made several speeches in Congress in which he attacked Mr. Underwood, charging him with being a tool of Wall Street, and in sympathy with saloon interests, and also declaring that Secretary Bryan was opposed to Mr. Underwood. The latter denied the truth of these charges and declared that he and Secretary Bryan were on the friendliest terms. In contrast with his opponent Mr. Underwood did not make an active campaign for the nomination. His only important address in the State was made on April 5, the day prior to the holding of the primary elections. The election resulted in the nomination of Mr. Underwood by over 20,000 votes. As his term did not begin until March 4, 1915, it was necessary also to elect a Senator to fill out the term until that date, in which contest Frank S. White, of Birmingham, defeated Ray Rushton, of Montgomery.

For the nomination for Governor, B. B. Comer, former Governor of the State, and Charles Henderson, State railroad commissioner, were the leading contestants, and after a close contest Mr. Henderson received the requisite number of votes for nomination.

In the election held on November 3, Mr. Underwood received 63,389 votes, and his Republican opponent, 12,320 votes. A full Democratic State ticket was elected as well as a solid Democratic delegation to Congress. Special efforts were made in the Seventh District to defeat Congressman Burnett, but he was successful over both Republican and Progressive candidates. The Republican membership in the State Legislature was reduced. George Huddleston, an attorney of Birmingham, was elected member of the national House of Representatives to succeed Mr. Underwood.

In May Henry D. Clayton, chairman of the Judiciary Committee of the House of Representatives, was appointed by President Wilson United States Judge for the middle and northern districts of Alabama. He assumed his duties on May 25, succeeding Judge Thomas G. Jones, deceased.

STATE OFFICERS, 1915. Governor, Charles Henderson; Lieutenant-Governor, Thomas E. Kilby; Secretary of State, John Purifoy; Auditor, M. C. Allgood; Attorney-General, W. L. Martin; Adjutant-General, to be appointed; Treasurer, W. L. Lancaster; Superintendent of Education, W. F. Feagin; Commissioner of Ag-

riculture, J. A. Wade; ex-officio Commissioner of Insurance, John Purifoy—all Democrats.

SUPREME COURT. Chief Justice, John C. Anderson; Associate Justices, Thomas C. McClellan, J. J. Mayfield, A. D. Sayre, Ormond Somerville, William H. Thomas, and L. D. Gardner; Clerk, Robert F. Ligon—all Democrats.

STATE LEGISLATURE, 1915.

	<i>Senate</i>	<i>House</i>	<i>Joint Ballot</i>
Democrats	84	104	188
Republicans	1	2	3

The representatives in Congress will be found in the section *Congress*, article UNITED STATES.

ALABAMA. UNIVERSITY OF. A State university for higher education, founded at University, Ala., in 1831. The students enrolled in all departments of the university in the autumn of 1914 numbered 750, the faculty numbering 75. There were no notable changes in the faculty during the year, and no noteworthy benefactions were received, the university being supported chiefly by State appropriations. The annual income amounts to \$165,000. The library contains 35,000 volumes. The president is George H. Denny, LL.D.

ALASKA. The year 1914 has been fruitful in events beneficial to this great Territory. There have been materially increased outputs of gold and silver, while copper has held its own. The fishery products exceed by 25 per cent the values of 1913. Congress has treated the Territory of Alaska with unusual liberality and consideration, authorizing an expenditure of \$35,000,000 for a system of railroads, and appropriating more than \$200,000 for aids to navigation. It also enacted laws which open to the public coal lands, so long withdrawn from general entry or use, and which now can be utilized under regulations promulgated by the Secretary of the Interior. The seal controversy, after years of bitter discussion, has been thoroughly examined and studied by a body of competent and impartial investigators, whose report promises definite conclusions.

POPULATION. The Governor of Alaska estimates that there has been an increase of 3000 in the white population since 1913, raising it to 39,000 in all. The native population of about 27,000 remains nearly stationary.

MINERAL PRODUCTION. The advance report of Jan. 1, 1915, by A. H. Brooks, the Alaskan expert of the Geological Survey, gives the following as to the mineral yield of 1914: The mineral output of Alaska to date aggregates \$268,000,000, of which \$248,300,000 was in gold, and \$19,800,000 in copper. The estimated value of 1914 is \$19,248,000, as compared with \$19,416,000 in 1913, divided as follows: gold (1914) \$15,900,000, (1913) \$15,628,813; silver (1914) \$191,000, (1913) \$218,988; copper (1914) 20,850,000 pounds, value \$2,872,000, (1913) 21,659,953 pounds, value \$3,357,293; other minerals immaterial changes from 1913. Placer gold remains unchanged in values, (1914) \$10,700,000, (1913) \$10,680,000, but there were increases in Ruby, Hot Springs, Iditarod, and Seward Peninsula districts, and marked decline from Fairbanks, and smaller declines elsewhere. The Chisana is the only new placer camp developed in 1914, though prospects are good in Healy River and the upper Tolovana. About 26 gold-

lode mines produced gold to the value of \$5,100,000, as against 30 mines and \$4,814,813 in 1913; Juneau remains the most important camp. Low prices closed four of the seven copper mines in operation on August 1, when extensive developments were in progress. Alaska has produced 550 tons of tin, valued at \$432,000, of which 50 tons were obtained from placer mines in 1914. Some tin was also produced by the lode-tin mine at Lost River, Seward Peninsula. Coal mining made no progress awaiting legislation, which came too late to affect this industry. Only one productive mine was worked, in one of the lignite fields. One patent only was issued in 1913, that to the mine at Port Graham. (For additional information as to coal, see CONGRESSIONAL LEGISLATION, below.) The output of tin, marble, gypsum, quicksilver, coal, and petroleum in 1914 was \$285,000, against \$272,242 in 1913. Important advances in mining are as follows: Dredges increased from 39 in 1913 to 44 in 1914. In Southeastern Alaska the Alaska Juneau has been added to the Treadwell group in reaching a productive stage. In the Fairbanks district 75 placer mines were operated, employing 1000 men, the decreased output being due to increased cost,—fuel, etc.,—which forbid the mining of low-grade gravels. The productive creeks range as follows in importance: Cleary, Goldstream, Dome, Esther, Fairbanks, and Vault. Cheaper power, fuel, and supplies are hoped for with the coming of a railway from tide-water. Abundant water raised the output of Iditarod and Innoko districts to \$2,200,000. While open-cut work with steam scrapers is general, two dredges have been installed. Important mining developments were made on Candle and Moore Creeks, tributaries of the Upper Tokotna. The production of Seward Peninsula has risen from \$2,500,000 in 1913, to \$2,700,000 in 1914; 1200 men were engaged in summer, of whom 450 were on dredges.

AGRICULTURE. So far farming and stock raising have been successful only to a limited extent, near the larger cities and for local markets. The United States is steadily endeavoring through experimental stations to determine the kinds of crops, and the special species, that can be profitably raised in the Territory. The experimental stations thus engaged are distributed as follows: Sitka, the central office, applies its efforts to horticulture, vegetables, nursery and orchard work. The pasturage of Kodiak Island has caused this station to be occupied for stock raising—sheep, dairy cattle, and breeding cattle. The Rampart station, in the Yukon valley, not far south of the Arctic Circle, has been more or less successful in the experimental growth of grains. Barley, oats, alfalfa, and wheat, of selected kinds, are found to ripen despite the shortness of the summer. The Fairbanks station, in the Tanana Valley, is devoted to farm demonstration for the encouragement and benefit of the many farmers in the valley. Vegetables, especially potatoes, hardy grains, and pig raising are the main lines of work.

COMMERCE. The value of merchandise shipments, including precious metals and copper, between Alaska and the United States, and between the Territory and foreign countries in the fiscal year 1912-13, amounted to \$61,076,692. Shipments of domestic merchandise from the United States to Alaska showed an increase of

\$1,749,912 over the previous fiscal year. There was an increase of copper production of \$296,937 over that of 1913, and an increase of \$44,268 in marble exports. A decrease in the volume of exports is shown over that of the previous year due to the falling off in gold production. The total value of merchandise sent from the United States to Alaska in the fiscal year 1913-14 was \$29,929,460. Of this, a value of \$11,880,140 was for manufactures ready for consumption, \$4,759,294 was for foodstuffs, partly or wholly manufactured, and \$1,520,565 was for foodstuffs in crude condition and food animals. The shipments from Alaska to the United States that year amounted to \$20,394,582, compared with \$23,006,246 in 1913. Of the total value, \$14,484,424 was of foodstuffs, partly or wholly manufactured, chiefly products of the fisheries. The shipments of gold and silver in 1913-14 amounted to \$12,440,118, compared with \$14,707,027 in 1912-13; copper shipped amounted to 25,583,458 pounds, valued at \$3,876,411, compared with 21,466,348 pounds, valued at \$3,579,474. The imports into the Territory from foreign countries in 1913-14 amounted to \$567,399, compared with \$982,271 the previous year. The larger part of this came from the United Kingdom. The exports to foreign countries, the greater part to Canada, amounted to \$1,090,763, compared with \$1,452,546 in 1912-13. The volume of shipments to and from Alaska materially increased in value during 1914. The exports and imports for the eleven months ending Nov. 30, 1914, exceeded those for the same months in 1913 by \$2,664,821, of which amount \$2,148,425 was in gold and silver bullion. It is of interest to note that in 1914 the liquors shipped to Alaska decreased in value by \$93,533, as compared with the previous year.

FISHERIES. The value of the fishery products from Alaska, including aquatic furs, whales, etc., approximates that of minerals. While statistics are lacking for the complete year of 1914, there are sufficient data to show an advance of 25 per cent over that of 1913. For the eleven months, January to November, inclusive, the value of fishery products exported from Alaska are as follows: 1912, \$16,322,135; 1913, \$15,189,533; 1914, \$19,027,970. Most important of all is the salmon fishery, which from 1868 to 1913, inclusive, produced values of \$155,041,769, being 96 per cent of the value of the products of small fish for that period. It is clearly apparent that the salmon catch of 1914 is the largest in the history of the country, the shipments from January to November, inclusive, being \$18,187,509, as against \$14,190,776 for 1913, and \$15,857,595 for 1912. The increase in 1914 is mainly due to the very large pack of red salmon in the Bristol Bay region. In central Alaska the run of pink salmon was particularly noteworthy, while in southeastern Alaska the run of pink salmon and of chum were light. Unusually large shipments of fresh salmon were made from southeastern Alaska, the standard king salmon being supplemented by other species. Cod, herring, and halibut fishing have been somewhat less productive owing to war conditions. An additional whaling station is now operated in Alaska, one in southeast Alaska, and the other near Uminak Pass.

In the calendar year 1913 there were 21,721 persons engaged in all branches of the industry; these included 11,892 whites, 4164 natives, 2061 Chinese, 1693 Japanese, and 1911 miscellaneous,

including Filipinos, Koreans, Mexicans, and others. There was a decline of 2542 persons in the total number employed in 1913, as compared with 1912, which was due chiefly to the fact that a number of fishing establishments were not operated. The total investment in the fisheries of the Territory in 1913 was \$37,047,205, a decline of \$1,216,152 from 1912. During 1913 there were 42 salmon canneries operated in southeast Alaska, 9 less than in 1912; 14 in central Alaska; and 23 in western Alaska.

NATIONAL FORESTS AND HOMESTEADS. There are two national forests in Alaska, Tongass National Forest in the southeastern part, and Chugach National Forest in the southwestern section. Of these Tongass is by far the most important. The total receipts from these forests for the fiscal year 1913-14 were \$58,781, and the total cost of administration was \$38,763. There were cut from the forests 43,756,712 board feet of timber. All persons living on or near the national forests are permitted to take free of charge all the wood they need for their own domestic purposes. Timber needed by prospectors in the actual developments of their claims, prior to reaching the shipping stage, is also free of charge. The number of homesteads surveyed during the year was 36, and the total number of timber sales was 348.

FURS AND FUR-BEARING ANIMALS. The value of aquatic furs and skins to include 1912 aggregated \$63,665,782, of which the fur-seal values amounted to \$50,993,911. The fur shipments for 1913 were valued at \$752,193, which will be somewhat exceeded in 1914 as the shipments to include November 30 are \$7000 larger than in 1913. The number of fur-seal skins from animals killed for food approximate 2500 in 1914. The regulations of the Secretary of Commerce, in force on Jan. 1, 1915, for the protection of fur-bearing animals were as follows: Killing prohibited for fur-seal until 1917, beaver until 1918, sea-otter until 1920, land-otter (Afognak reservation) until Nov. 16, 1915, foxes (Afognak) until Nov. 16, 1918. Mink, land-otter, marten, weasel, muskrat, lynx, and fox are protected during the breeding season,—generally from April to November. Black bear, wolf, wolverine, squirrel, and hare may be killed in any season. The use of poison is prohibited, as well as the barter or possession of an unprime skin of any fur-bearing animal. Fox farming is being gradually extended to suitable islands, which are now leased under advertisement by the United States for exclusive use for this purpose.

Fur Seals. The North Pacific Sealing Convention of July 7, 1911, prohibiting pelagic sealing continues in force and has been efficiently enforced, as well as the act of Aug. 24, 1912, for a close season until 1917. The natives of the Pribilof Islands kill enough for food. Measures have been taken definitely to settle the prolonged and bitter controversy as to the best methods of preserving and utilizing the Alaskan seal herds. In January, 1914, the Commissioner of Fisheries recommended an investigation of the whole subject by three recognized experts, not previously identified with fur-seal matters. The Secretary of Commerce caused to be appointed as such investigators the three following: Mr. Edward A. Preble, Bureau of Biological Survey, nominated by the Secretary of Agriculture; Mr. Wilfred H. Osgood, Field Museum of Nat-

ural History, Chicago, nominated by the Secretary of the Smithsonian Institution; and Professor George H. Parker, Harvard University, nominated by the National Academy of Sciences. These officials made a thorough investigation of the seal islands and their full report on the seal herd, now in preparation, will be submitted early in 1915. A careful census was made of the seal herds of the Pribilof Islands, and it is believed that the number has materially increased since previous census, which showed 215,940 in 1912 and 268,305 in 1913.

REINDEER. The reindeer industry has in 20 years made the natives inhabiting the coastal regions from Point Barrow to the Alaska Peninsula a comparatively civilized and thrifty people. They have by their herds assured support for themselves and opportunity to acquire wealth by the sale of meat and skins. During 1912-13 nine new herds were established. On June 30, 1913, there were 47,266 reindeer in the 63 Alaska herds, or a net increase of 23 per cent for the fiscal year. The number of deer owned by the natives has increased from 6406 in 1907, to 30,532 (65 per cent of all) in 1913. The total number on June 30, 1914, was approximately 60,000. The original cost and subsequent care of the herds to 1913 amounted to \$297,000, while the value and income in 1913 was estimated to be \$1,463,171.

EDUCATION. In 1914 there were 27 schools for white children outside of incorporated towns, and these employed 38 teachers and had a total enrollment of 941. There are a number of communities which are denied the privilege of educating their children because of an insufficient number of school age to entitle them to the establishment of schools, as the existing law provides that there shall be at least 20 white children of school age in a community, outside of incorporated towns, before a school can be authorized. The law also limits the amount which may be expended in the construction of a school building to \$1000, which was frequently found to be insufficient to cover the cost. The school attendance is regulated by the territorial legislature at its first session in 1913. This law applies to white children and those of mixed blood between the ages of 8 and 16, living civilized lives in the Territory, and residing within two miles of any school outside of incorporated towns. Similar provision was made for the compulsory education of native children and children of mixed blood between the ages of 8 and 16, not living civilized lives, where such children reside within one mile from the United States Public School. The schools in incorporated towns are supported by local taxation. Equally important, and even more comprehensive and extensive is the work of the Alaskan Bureau of Education, which maintains at the expense of the United States, schools in 77 villages, with an enrollment of 3563 native pupils, and an aggregate force of 132 officials, teachers, nurses, doctors, etc. Teachers are required to promote the moral, physical, mental, and industrial welfare of the native adults as well as children. Carpentry, cooking, laundering, sewing, gardening, and sanitation are given special attention. Medical care is also exercised under the supervision of an officer of the Public Health Service, which during 1914 utilized seven hos-

pitals and treated nearly 4000 cases. The economic conditions have been improved by the establishment of coöperative stores for the natives at Gambell, Wales, Hydaburg, and at the remote isle of Atka. The Bureau also fosters the plan of concentrating colonies of selected natives on reservations, near good fishing and hunting grounds, where they will be removed from white settlements and learn methods of self-government, coöperative work, etc. Such native communities have lately been established of Haidas at Hydaburg, Prince of Wales Island, of Klukans in the valley of the Chilkla, and of Klawocks in Tongas forest; marked improvement of these villages is noted in 1914. The Duncan colony of Metlakahtlas, on Annette Island, has been materially benefited by the establishment of a school in the fiscal year 1913-14. The day school has 120 enrolled pupils, and the night school about 30: the Indians contribute \$250 towards the salary of the teacher.

TRANSPORTATION. The railway systems remain unchanged at 466 miles, of which only 261 were operated during 1914,—the White Pass and Yukon, the Tanana, and the Copper River and Northwestern Railroads. Surveys have been made for the government railroad, authorized by the act of March 12, 1914, which is elsewhere considered. While railroads are essential to the development of great industrial enterprises, roads and trails are absolutely indispensable to daily life and for the advancement of mining, the principal resource of the Territory. The Board of Commissioners, under Colonel Richardson, has completed up to June 30, 1914, an aggregate of 4298 miles of roads, etc., divided as follows: 870 miles of wagon roads, 618 miles of winter sled-roads, 1810 miles of regular pack trails, and 1000 miles or more of flagged winter trails. A wagon road permits stage travel from Valdez to Fairbanks, whence by sled roads Circle and Fort Gibbon on the Yukon River are comfortably and speedily reached in winter. Pack trails extend as far north as Candle on Kotzebue Sound, to the valley of the upper Koyukuk, and beyond Fort Yukon.

TELEGRAPHS. The military cable, wireless and land-line system extends from Seattle, Washington, to Nome, Sitka, Skagway, Fairbanks, Juneau, Ketchikan, and other points, enabling telegraphic communication with the rest of the world. The efforts and recommendations of the Postmaster General to secure authority of Congress for the transfer of this system to his department have been so far fruitless, although the War Department approves of such action. The following important radio (wireless) stations are maintained in addition to the cables and land-lines: *U. S. Army*; Circle, Fairbanks, Fort Egbert, Fort Gibbon, Nome, Nulato, and St. Michael. *U. S. Navy*; Cordova, Dutch Harbor, Kodiak, St. Paul (Pribilof Islands), Sitka, and Unalga. *Commercial*; Iditarod, Juneau, Karluk, Hallerville, Ketchikan, Naknek and Nushagak. A commercial network of telephone lines on Seward Peninsula brings Candle and Deering on Kotzebue Sound into the general telegraphic system.

AIDS TO NAVIGATION. The Alaskan waters are largely uncharted, and until recent years the dangers of navigation were still further enhanced by the absence of aids to ship-masters in the way of lights, fog-signals, etc. The num-

ber of lights was increased by 15 during the past year, making the aggregate number on June 30, 1914, 108, of which 71 had been installed between 1911 and 1914. There are now 319 aids in all, of which 10 are fog-signals, 157 buoys, and 44 day marks. Work is progressing on the establishment of a light and fog-signal at or near Cape St. Elias, for which the sum of \$115,000 was appropriated by the act of Oct. 22, 1913. The sundry civil act approved Aug. 1, 1914, appropriated \$80,000 for the improvement of existing aids to navigation in Alaskan waters, which are now in progress of installation in the form of lights, fog-signals, etc.

CONGRESSIONAL LEGISLATION. The Sixty-third Congress enacted into law two very important measures intended to alleviate conditions which for years have prevented development of the resources of the Territory. The first of these measures provided for a government owned railroad and the second made provision for utilizing the coal deposits. The passage of the former measure was due largely to the exertions of Secretary of the Interior Lane. In June, 1913, he called the attention of the Senate Committee on Territories to the importance of railways in the development of resources in Alaska, and shortly after began the preparation of a bill making provision for the construction of a government owned railroad. In a previous year the President had appointed a railroad committee consisting of Major Jay J. Morrow, Engineer Corps, U. S. Army; Alfred H. Brooks, geologist in charge of Alaskan surveys; Leonard M. Cox, civil engineer; and Colin Macrae Ingersoll. The commission was authorized to conduct an examination into the transportation question in the Territory; to examine railroad routes from the seaboard to the coal fields and to the interior, and navigable waterways; to secure surveys and other information with respect to railroads, including cost of construction and operation; to obtain information in respect to the coal fields and their proximity to railroad routes; and to make report thereon to Congress, together with their conclusions and recommendations in respect to the best and most available routes for railroads in Alaska. This commission at once began work, and largely as a result of its investigations, congressional action followed. The Act of Congress, March 12, 1914, provides for an appropriation of \$35,000,000 for the construction of 1000 miles of railroad and for the acquisition of existing lines. The government may operate or lease the roads, which are to extend from the harbors on the southern coast to the navigable waters and agricultural lands of the interior and also to the coal fields. The President is authorized to appoint officers and agents, and in general to supervise the construction and operation of the road. He is also given power to utilize machinery no longer needed for the Panama Canal if he deemed it advisable. In May, 1914, President Wilson appointed a commission to locate the projected railroads and superintend their construction. This commission includes Lieut. Frederick Mears, of the Navy; William C. Edes, and Thomas Riggs, Jr., of the U. S. Coast and Geodetic Survey. Preparations were made by the U. S. Geological Survey to send 11 parties to make investigations as to the mineral resources

of the Territory. These parties will visit all the known and unknown regions and their inquiries will relate in part to the location of the railroad lines.

The act of Oct. 20, 1914 provides for the utilizing of coal lands. By its main features, all coal lands are to be surveyed, and of them there are to be reserved for the United States not exceeding 5120 acres of the Bering River field, 7680 acres of the Mantanuska field, and one-half of other coal lands. Unreserved coal lands may be leased to adult citizens, or American corporations, in 40-acre blocks, not exceeding in the aggregate 2560 acres, for 50 years, with opportunity of renewal. Royalties for coal mined are to be not less than two cents a ton, and land rentals varying from 25 cents to \$1 per acre annually, chargeable against royalties for the year. Rentals and royalties, together with profits from government mines are to be used for the improvement of Alaska, the residue to be turned into the Alaskan Fund. For domestic needs free licenses are guaranteed, without royalties, for not more than 10 acres of coal land. Provisions are made for an eight-hour day, for the welfare and safety of the miners, and against waste, carelessness, overcharging, and subletting.

COAL PERMITS. Temporary regulations for the issuance of permits for the free use of coal in the unreserved public lands of Alaska were promulgated by the U. S. Commissioner of Public Lands on Dec. 30, 1914, the coal fields of Bering River and Mantanuska being specially reserved for the present. Adult citizens and American corporations,—railroads and common carriers excepted,—may mine coal for use and for sale. Permits are for two years, subject to renewal; they cover 10 acres of coal lands which shall have been previously marked by the applicant with substantial monuments. Coal thus mined must be sold for a reasonable price, covering expense of mining, etc. The regulations are of a temporary character under Section 10 of the act of Oct. 20, 1914, pending the preparation of permanent regulations.

ALASKAN-CANADIAN BOUNDARY. The demarcation of the entire boundary line between Alaska and Canada was completed in 1914 under the direction of a joint commission composed of O. H. Tittmann, Superintendent of the United States Coast and Geodetic Survey, and W. F. King, the Dominion Astronomer of Canada.

The boundary of Southeastern Alaska was delimited in conformity with the award of the London Tribunal of 1903, and with the agreement of 1905 in regard to a certain portion of the line. The water boundary from the southernmost end of Prince of Wales Island eastward and through Portland Canal, and to its head, was carefully established and defined by reference monuments on shore. The deflection points on the land boundary were trigonometrically determined. The river crossings and passes, and many other points were monumented, and the whole region along the land boundary was mapped either photo-topographically or, at the crossing of the streams, with the plane table.

The delimitation of the one hundred and forty-first meridian was effected under the treaty of 1906. Starting at a point a little to the westward of the highest peak of Mount St. Elias the boundary line runs north for 646 miles to the Arctic Ocean. A trigonometric and topographic

survey covering a width of 2.5 miles on each side of the boundary was made, and it was marked with aluminum-bronze monuments. The work involved hardships and the overcoming of many difficulties. Prior to the survey, the Arctic end of the boundary was practically unknown, and the region for 70 miles north of Mount St. Elias, except as seen by Abruzzi and Russell from that mountain, was unexplored. A large part of the glacial area of this boundary lies at elevations from 6000 to 15,000 feet and was mapped by photography. The final marking of this boundary is an important event as it removes all sources of international dispute, which might arise from lack of such a demarcation. The maps of the one hundred and forty-first meridian area are now being printed, and those of Southeastern Alaska are in course of compilation.

ALBANIA. Formerly a Turkish possession; created an independent state by the provisions of the treaty of London May 30, 1913. The area is estimated at 28,000 kilometers, carrying 800,000 inhabitants. Scutari has about 30,000 inhabitants.

HISTORY. The Embassadorial Conference agreed Dec. 20, 1912, to the principle of Albanian autonomy, and before the close of the year 1913 it had become pretty generally known that the Powers had settled upon the Protestant German Prince William of Wied, a relative of the Queen of Rumania (Carmen Sylva), to be the first prince of the independent principality of Albania. Early in 1914 Prince William paid brief visits to Vienna, Rome, London, Berlin, Paris, and St. Petersburg, with the hope, it was believed, of inducing the Powers to guarantee him a loan of \$15,000,000. He was able to secure only an advance of \$2,000,000 from Austria-Hungary and Italy, the two Powers which had insisted upon the creation of Albania; but this amount appeared to be satisfactory, for Prince William graciously accepted the crown offered him on Feb. 23, 1914, by a delegation led by Essad Pasha. Meanwhile, the International Commission of Control, which was to assist and superintend the pacification of Albania, had met on Dec. 15, 1913, at Avlona, and had received the submission of Ismail Kemal Bey's provisional government in January, and, somewhat later, the resignation of Essad Pasha. On January 6 an expedition of 200 Turkish adventurers, led by Bekir Agha, had landed on the coast of Southern Albania, with the obvious intention of stirring up trouble and with the suspected intention of proclaiming Izzet Pasha (a prominent Turkish general, statesman, and diplomat) as prince of Albania. The expedition was a ludicrous failure, and its officers were court-martialed while the common soldiers were deported. In this fashion Ismail Kemal Bey, Essad Pasha, and the Turkish filibusters had been disposed of, clearing the way for the spectacular arrival of William of Wied on March 7, 1914, at Durazzo, which had been selected as the capital.

As the founder of the first Albanian dynasty, the prince took the name William I; in the European press he speedily became known as "the *Mpret*" (the Albanian word for prince). A few days after his accession, William issued a proclamation to his people, and installed a ministry (March 17), constituted as follows: grand vizier, Turkhan Pasha; war, Essad

Pasha; interior, Prenk Bib Doda; justice, Aziz Pasha; education, Dr. Tertulli Bey; agriculture, Assan Bey Pristina. The grand vizier was acknowledged to be a statesman of wide experience and considerable ability; his colleagues in the departments of war and the interior were selected for their powerful influence respectively with the Mohammedan and the Roman Catholic elements in Albania. Essad Pasha, however, proved himself to be a most unruly cabinet officer. He was so strongly suspected of fomenting rebellion against the government, that on May 19 he was arrested by the gendarmerie, after an exchange of shots, and deported to Brindisi, Italy. Essad's flight occasioned a cabinet crisis, resulting in the formation of a new cabinet under Turkhan Pasha, as follows: grand vizier and minister of foreign affairs, Turkhan Pasha; minister of the interior, Akif Pasha; finance, Philip Nogga; justice, Mufid Bey Libohova; public works and posts, Midhat Bey Frasheri; education, Dr. Tertulli Bey; agriculture, Abdi Bey Toptani.

During the months of February, March, April, and May, the chief difficulty of the Durazzo government was with the Greek-speaking inhabitants of northern Epirus. An international commission, it will be recalled, had in 1913 assigned to Albania the districts of Tepeleni, Argyrocastro, Kolonia, Premetti, and Leskoirk, in the face of energetic opposition. The Greek-speaking inhabitants of these districts of Epirus, under the leadership of M. Zographos (a former foreign minister of Greece) on Feb. 28, 1914, declared their intention of resisting incorporation into Albania. At Argyrocastro they established a provisional government, defying the Albanian gendarmerie, and successfully meeting force with force. The Powers, appealed to by the Albanian government, remonstrated with the Greek Government for its presumed encouragement of the Epirote insurrection, and for its delay in withdrawing the Greek troops from Southern Albania. In reply, the Greek government testified to "the grief which she (Greece) feels to have to separate herself from regions Greek in culture and national consciousness since thousands of years, and from Greek populations which after so many centuries have just welcomed their national reestablishment with an unconquerable sentiment of patriotism." Greece secured a slight "rectification" of the frontier in the Argyrocastro region; as for the rest Greece agreed to withdraw her troops and offer no resistance, either directly or indirectly, to the fulfillment of the Powers' wishes regarding Southern Albania. On the basis of this arrangement the Powers on May 7 intervened to bring about an armistice in the Epirote insurrection, and ten days later representatives of the Epirotes and of the International Commission reached an agreement at Corfu, according to which the rebels were to receive full amnesty, the Greek-speaking Epirotes were to have satisfactory safeguards for their language and religion, and the districts of Koritza and Argyrocastro were to be granted a considerable measure of self-government with Christian governors and elective councils.

While the *Mpret* was congratulating himself upon the settlement of the Epirote question, he was suddenly confronted with a more serious danger. Essad Pasha while holding the port-

folio of the interior had been secretly stirring up insurrection among the Mohammedan subjects of the *Mpret*. The traitorous minister was exiled, as we have already noted, on May 19; but the Moslem insurrection was not thus to be averted. In formidable numbers the Moslem insurgents approached Durazzo. For a moment William lost courage and took refuge on the convenient Italian warship *Misurata*, May 23; he returned to his capital, however, with a firm determination to suppress the insurrection. On June 15 the insurgents attempted to carry the city by storm, only to be repulsed by the loyal garrison and the Austrian guns of the palace. The defenders of Durazzo lost 35 wounded and 2 killed, including the Dutch officer, Colonel Thomson, who had been placed in charge of the Albanian gendarmerie. Throughout July the *Mpret's* situation continued to grow more uncomfortable, as the Powers neglected to furnish him with financial or military aid, and the insurgents besieging Durazzo clamored for his abdication. For a time hope was entertained that Rumania would be authorized as the mandatory of the Powers to quell the rebellion.

The outbreak of war in Europe, and the resulting inability of the "concert of the Powers" to come to William's support, spelled success for the insurrection. Shortly after the Powers withdrew their forces from Scutari, it was reported that the insurgents had occupied Avlona and were overrunning all Central Albania. On September 3 William fled the country, leaving behind him a proclamation, assuring the Albanians that although it was at present expedient for him to leave his realm, he had no intention of abandoning his task; "whether far or near," he declared, "I shall have only one thought—that of working for the prosperity of the noble, chivalrous Albanian country. During my absence the International Commission of Control will assure a government." The International Commission did not even attempt to govern the country. The rebel Moslem forces easily captured the capital and elected Prince Mohammed Burham Eddin Effendi, the fourth son of the ex-sultan Abdul Hamid, to be prince of Albania under the suzerainty of Turkey. The real power in Albania, however—for Mohammed Burham Eddin Effendi was not in Albania at all—was Essad Pasha, the exiled minister of war, who had returned to lead the Moslem forces, and was installed as grand vizier. Now again the Epirote question was raised, for the Greek Christians in Northern Epirus would never submit to a Moslem government. Anarchy reigned in the south of Albania, and in the central and northern portions the condition was most serious on account of the scarcity of food. No one was much surprised, consequently, when Greek troops again, late in October, occupied Northern Epirus, and simultaneously Italy sent an expedition to Avlona. M. Venizelos, on the part of the Greek government, disclaimed any intention of regaining part of Southern Albania (i.e., certain districts of Northern Epirus) for Greece; and the action of the two countries was explained as a simple police measure, designed to maintain order and to relieve some of the misery of the starving Albanians. In December a counter-revolution threatened to destroy the power of Essad Pasha, and furnished Italy with

an occasion for occupying Avlona in force, December 25.

More of interest than of importance attached to the picturesque escapades of George Fred Williams, formerly United States minister at Athens, who was relieved of his diplomatic post after having provoked a storm of sarcastic criticism by his very undiplomatic comments on the Albanian situation. From Athens, Mr. Williams journeyed to Epirus, fearless in his conviction that by organizing a cantonal form of government he could solve the Albanian problem. Upon his return to the United States, Mr. Williams informed the Press that the Albanians would gladly have made him their ruler.

ALBERT, KING OF BELGIUM. See **BELGIUM** and **FRANCE**, under section *History*; and **WAR OF THE NATIONS**, *passim*.

ALBERTA. A province (since Sept. 1, 1905) of the Dominion of Canada. It includes the former district of Alberta, the western part of Athabasca, and a strip of Assiniboia and Saskatchewan. The capital is Edmonton. Area, 255,285 square miles, with (1911) 374,663 inhabitants. The population has increased rapidly from 72,841 in 1901—an increase of 413.1 per cent. Free homesteads are available for thousands of settlers. Edmonton had, in 1911, 24,900 inhabitants; Calgary, 43,704; Lethbridge, 8050; Medicine Hat, 5608; Strathcona, 5579, but the population has greatly increased since the census was taken. During 1914 there were nearly 1000 miles of new railway put into operation, and at the end of the year, the total mileage was 4250, having doubled in amount since Dec. 31, 1911. The provincial government is under a lieutenant-governor, appointed by the governor-general of Canada; he acts through an executive council, or responsible ministry, of eight members. There is a unicameral legislative assembly of 56 members directly elected for five years. The lieutenant-governor in 1914 was George Hedley Vicars Bulyea, appointed Sept. 1, 1905. Premier 1914, A. L. Sifton. See **CANADA**.

ALCOHOL. The campaign against alcohol, waged of late years in various European countries, was brought sharply to a focus by the European war of 1914. The conditions under which modern warfare is waged necessitate strict discipline, efficiency, endurance, and self-restraint on the part of both officers and men, and it was suddenly realized that habitual indulgence in alcoholic beverages precluded these requirements. In Germany strict orders were issued when the army was mobilized against selling or offering for sale to the troops alcohol in any form. In France the Parisian prefect of police forbade the sale of absinthe during mobilization, a measure followed by prefects of several other departments. Finally the sale of absinthe was forbidden throughout all France by order of the minister of the interior. In Morocco the evil consequence of furnishing alcohol to the natives became so apparent that the absolute interdiction of absinthe to Europeans as well as natives had to be enforced. A decree of the Sultan was issued prohibiting the importation, manufacture, circulation, or sale of absinthe and similar products in the French portion of the country, except by pharmacists or for municipal purposes. Heavy penalties were enforced against violations of this decree. Vodka, the favorite alcoholic beverage of the Russians, and the cause

of much poverty and wretchedness among them, came under the government ban at the beginning of the war. Not only in the army, but throughout the whole of Russia the manufacture of vodka was stopped and the reported results tax the credulity of the hearer. Bank savings are said to be greatly increased, artisans work a day or two more per week, wretched villages have taken on the appearance of thrift, food and clothes are plentiful, and petty crimes of all sorts are rapidly diminishing. The last appeal against Russia's prohibition decree failed in December. Even beer and light wines were banned, subject to authorization by local city councils. In Great Britain less drastic measures have been adopted, but general sobriety and the early closing of liquor shops have been the rule.

In the early part of 1914 alcoholic beverages were entirely abolished in the United States navy under an order issued by the Secretary of the Navy. This order reads, "The use or introduction, for drinking purposes, of alcoholic liquors on board any naval vessels, or within any naval yard or station, is strictly prohibited, and commanding officers will be held directly responsible for the enforcement of this order." Finland had twice passed national prohibition. Greenland and Iceland voted themselves "dry." The *Liquor Dealers' Journal* asserts that 27 per cent of the States in the United States were ready to vote for national prohibition.

The influence of alcohol on heredity, a subject which has furnished many a warm debate, has been studied during the last four years by Stockard of the Cornell University Medical School. He apparently has shown that the germ cells of males can be injured by allowing the individuals to inhale alcohol fumes to the extent of producing defective offspring even when mated with vigorous untreated females. He has shown also that these offspring on reaching maturity are nervous and undersized and that their descendants for three generations at least possess similar characteristics. Stockard regards it as plainly demonstrated that the spermatozoon is actually weakened, if not disabled, by alcohol, and that all individuals arising from combinations involving such germ cells are likely to be sub-normal. These experimental observations are reinforced by a number of statistical studies. For example, Juillerat and Filassier, the latter chief statistician of Paris, published the results of researches made by them into the causes of infant mortality in Paris, which researches show concisely the ravages of alcoholism. In ten years, from 1903 to 1914, almost half of the 97,885 children dying were under 11 months old, congenital debility being responsible for 12,342 of these deaths. The investigators assume that this enormous proportion is attributable to alcoholism in the parents, and use Jacquet's statistics to bear them out. In the investigation which Jacquet made from May 1, 1913, at the hospital Saint Antoine, he divided the 396 patients whom he examined into three classes; moderate alcoholics (who consumed a liter of wine per diem); decided alcoholics (those consuming from 1.5 to 2 liters of wine); and the very decided alcoholics (those who habitually consumed 2 liters of wine or more). These patients had a total of 879 children. The moderate drinkers numbered 141, the births among

them 305, and the deaths 83, or 18.78 per cent. The second class, numbering 108, had births among them numbering 248 and deaths 115, or 26.01 per cent. The decided alcoholics numbered 147; they produced 326 children of whom 244 died, a percentage of 55.47 per cent. Of the 442 dead children, 272 succumbed in early infancy. These 396 individuals, all addicted to alcohol in various degrees, showed a round mortality of 50.28 per cent. Similar studies from the department of the Vosges lead to the same conclusion. He showed that it is the non-alcoholic regions of France which have the smallest number of deaths from tuberculosis, about 1.95 per thousand of the inhabitants. In the West, where there is a heavy consumption of alcohol, the rate is 2.61 per thousand. In the West also infant mortality is particularly high, hereditary weakness, insufficient maternal care and poor food being contributory factors. Alcohol is even sometimes put into the nursing bottle. The greatest number of alcoholic women is found in Normandy. See INSANITY; VAGRANCY.

WOOD ALCOHOL. Steadily increasing employment of wood alcohol in industrial processes has given impetus to the study of the toxicity of this substance. Methyl alcohol gains access to the body in three ways, namely, by the stomach, by inhalation of its vapor, and by external application to the skin. Its absorption by any of these methods may give rise to blindness (due to atrophy of the optic nerve), death, or lesser degrees of poisoning. New York City places strict regulation upon this substance and carries on investigations continually. From July 1, 1913, to July 1, 1914, the Department of Health examined 233 toilet preparations intended for external use, in none of which did the label announce the presence of wood alcohol when it existed. Of 158 specimens of bay rum 61 contained methyl alcohol; 14 of the 33 specimens of hair tonic examined were thus adulterated; 11 of 220 samples of toilet water, and 2 out of 19 specimens of witch-hazel contained it. A considerable number of cases of fatal poisoning have been reported from inhaling the fumes of wood alcohol in confined spaces. Under such circumstances the vapor was believed to be in a very concentrated form. According to recent investigations by Loewy and von der Heide at the Royal Agricultural College in Berlin, it is proved that relatively small quantities of the fumes may produce chronic poisoning; amounts as low as 0.2 per cent in the inspired air may lead to absorption, which though slow, none the less produces saturation of the organism with the alcohol. The same investigators also announce that fat animals absorb considerably less vapor than lean subjects. This is believed to be due to the fact that alcohol is not readily soluble in fats and lipid tissues. According to the *Journal of the American Medical Association* nearly a thousand cases of poisoning have been reported since 1893, the date when methyl alcohol of a high degree of purity began to be made. The *Journal of Industrial Engineering and Chemistry* states that the business of manufacturing methyl alcohol amounts to about ten million gallons annually, with a capital investment in this country of about twelve million dollars. Over three thousand workers are employed. There were in 1914 sixty-three manufacturers of wood alcohol

in the United States. See OCCUPATIONAL DISEASES.

ALFALFA. Estimates on the annual production and acreage of alfalfa, as for wheat and other leading crops, are not published and the output of alfalfa hay is generally included in the figures representing the total yield of hay from all crops grown for the purpose. It is evident from reports in the agricultural press and from the interest exhibited in the crop by institutions and organizations such as the agricultural colleges and experiment stations, State boards or commissions of agriculture and the like, that the value of the plant as a source of forage and as a means of soil improvement is being more and more appreciated and its area extended. In Wisconsin, for example, an Alfalfa Order has been organized among the farmers constituting the Experimental Association established in the State, and through its efforts high-grade and selected seed is bought on the cooperative plan and distributed at a material saving in price and widespread cooperation in testing the crop is secured. It is reported that of 240 trials where alfalfa was grown for the first time 88 per cent were successful. The members of the organization are also cooperating in determining the relative value of seed grown on irrigated and nonirrigated lands, of seed grown in different sections of the West and of strains of imported seed. Through the work of such agencies the acreage devoted to alfalfa is not only increasing steadily in localities where the crop is already established but its culture is also carried to sections where the plant is new and its requirements must be studied and determined. This extension in the United States has been both northward and southward. To the north its culture extends into Canada where a production of 218,400 tons of alfalfa hay was secured in 1914. The preceding year the production amounted to 237,770 tons, the reduction in yield for the past year being due to drouth, especially in the western provinces.

As the result of a growing alfalfa area, increased attention is also given to the production of the seed in sections adapted to its culture. According to the Department of Agriculture South Dakota, which is now the leading State in alfalfa seed production, produced in 1914 over 140,000 bushels, having a value of approximately \$1,000,000. Experiments conducted by the Colorado Experiment Station at Ft. Collins indicated that continued irrigation for a long series of years so influences the moisture content of the subsoil that the land becomes unsatisfactory for growing alfalfa for seed.

ALGERIA. A country in northern Africa, constituting administratively an integral part of the French Republic. The capital is Algiers.

AREA AND POPULATION. The area and population by departments (census of March 5, 1911), are as follows: Algiers, 54,540 square kilometers, 271,767 European and 1,421,819 native inhabitants; Constantine, 87,302 square kilometers, 155,654 European and 1,945,443 native inhabitants; Oran, 65,897 square kilometers, 319,089 European and 892,212 native inhabitants; making a total for Algeria proper of 207,739 square kilometers, and 746,510 European and 4,259,474 native inhabitants. The Southern Territories covered 367,650 square kilometers, and had 5533 European and 481,062 native inhabitants. Total, Algeria, 575,289

square kilometers, or 222,119 square miles; European inhabitants, 752,043; native, 4,740,526. In addition, the population counted apart numbered 27,295 in Algiers, 17,349 in Constantine, 18,894 in Oran, 7721 in the Southern Territories; making a total for all Algeria of 5,563,828 inhabitants. The births for the year 1910 numbered 153,157, still births 2338, deaths 108,950, marriages 40,776. The communal population of Algiers in 1911 was 172,397; Oran, 123,086; Constantine, 65,173; Bone, 42,039; Tlemcen, 39,874; Blidah, 35,461; Tizi-Ouzou, 31,404; Mascara, 24,254; Mostaganem, 23,166.

EDUCATION, ETC. There were in 1911, 1235 primary and infant schools, public and private, with 3026 teachers and 141,537 pupils; of these schools 226 were Mohammedan. There were 22 secondary institutions, with 5988 pupils (4411 boys, 1577 girls). There are normal schools and Mohammedan industrial schools. State expenditure during 1911, 8,861,798 francs.

Except for the Jewish population, classed as French citizens, the native religion is Mohammedanism. The courts of first instance (native) are administered by the cadis, with an appeal to the French courts.

PRODUCTION. The population reported as engaged in agriculture in 1909 was 3,322,540, of whom 213,756 were Europeans. The plains are very fertile, the mountainous North is largely devoted to grazing, and the coast regions are under high cultivation by Europeans. The area under vines in 1910 was 152,100 hectares, yielding 8,414,000 hectoliters of wine; cereals, 3,001,000 hectares yielding 22,147,000 quintals; roots, legumes, etc., 89,300 hectares, 1,319,000 quintals; forage plants and sown grass, 26,000 hectares, 822,000 quintals. Natural grasses covered 851,000 hectares, the harvest being estimated at 3,871,000 quintals. Olive trees number 6,655,000, yielding 3,364,000 quintals of olives and 351,000 hectoliters of oil. The following figures for 1912 are derived from an English source: 350,652 acres under vines, producing 146,765,982 gallons of wine; 1045 acres under cotton, 6,559,490 acres under forest.

The table below shows area officially reported as under principal cereals (in hectares), production (in quintals), and production per hectare in 1914:

	Hectares		Quintals		Qs. per Ha.
	1913	1914	1913	1914	
Wheat	650,568	672,616	4,000,000	3,000,000	4.5
Barley	629,387	678,059	5,000,000	1,800,000	2.7
Oats	52,581	57,018	600,000	450,000	7.9
Tobacco	2,700	8,000
Vines	18,000	14,000

Returns are for the Department of Constantine. The figures for 1914 are subject to slight revision. There were in 1911: 226,764 horses, 192,484 mules, 279,316 donkeys, 1,113,952 cattle, 8,528,610 sheep, 3,561,847 goats, and 110,012 swine.

There were 5392 persons engaged in fishing in 1912, with 1410 boats of 4406 metric tons. Iron, zinc, lead, mercury, copper, antimony, and petroleum are mined.

ALIEN LABOR LAWS. See under LABOR.

ALSACE-LORRAINE. See WAR OF THE NATIONS.

ALTMAN COLLECTION. See PAINTING AND SCULPTURE.

ALUMINUM. The production of aluminum in the United States in 1913 was 72,379,090 pounds, compared with 65,607,000 pounds in 1912. The production in 1913 was the largest in the history of the industry, which had shown great and consistent increase since 1883, when the production was first begun. There was exported aluminum with a value of \$966,094 in 1913, compared with a value of \$1,347,621 in 1912. One of the most important items in relation to the industry in 1913 was the continued progress on the project of the Southern Aluminum Co. near Whitney, N. C., but construction work was suspended in 1914 on account of financial difficulties due to the war. The plans of the company contemplated the erection of a dam approximately 1200 feet long and more than 200 feet high. During the early stages of the manufacturing of aluminum by this plant the alumina will be imported, as the reduction plant for making the metal will be ready to operate before the laboratory in which the pure alumina is to be made is complete. Imported bauxite may be used during the early stages of the enterprise, or at least until an adequate supply of the proper ore is located in the United States. At the beginning only ingot metal will be made, but it is very likely that in time wire, vessels, and other finished forms will be manufactured.

In 1913 the Aluminum Company of America pushed exploratory work on Little Tennessee River near the boundary between Tennessee and North Carolina with a view to the final selection of two dam sites, and in 1914 started a small plant at Maryville, Tenn. At the plant of this company at Massena, N. Y., extensive additions and improvements were made in 1913. The foil mill of this company began operations early in 1914 and found a wide market for its products owing to the cessation of imports of aluminum occasioned by the European war.

The United States Tariff Act of 1913 placed a duty of two cents a pound on alumina scrap and alloys and three and one-half cents a pound on aluminum in the form of plates, strips, bars, sheets, and rods. This caused a general reduction of price for the metal in the United States. The average price of metallic aluminum in New York City varied from 26¼ cents per pound in January, 1913, to 19½ cents per pound in December. In 1914, the average price ranged from 18.81 in January to 18.96 cents a pound in December, with an average for the year of 18.63 cents.

Imports of aluminum into the United States during the first 10 months of 1914 were 14,398,031 pounds, compared with 20,775,103 pounds in the corresponding period of 1913.

WORLD'S CONSUMPTION OF ALUMINUM

(Metric Tons of 2204.6 lbs. avoirdupois.)

(From statistical report of the Metallgesellschaft, Frankfurt am Main)

	1912	1913
United States ^a	29,800	32,800

France	18,000	18,000
England	7,500	7,500
Italy	800	800
Norway	1,500	1,500
Totals	62,600	68,200

The use of aluminum was being extended on a large scale in the construction of welded tanks, cooking vats, and vessels employed by brewers, preserve manufacturers, fat recoverers, and in similar industries where a metal that will conduct heat, will not corrode, and is not poisonous is essential. An important process for extracting aluminum from its ores was patented in 1913 by Alan Kierstock. Charles Martin Hall, inventor of the electrolytic process for the manufacture of aluminum, died on Dec. 27, 1914. See BAUXITE; CHEMISTRY, INDUSTRIAL.

AMERICAN ASSOCIATIONS AND SOCIETIES. For any organization whose official title begins with the word American, see under the specifically descriptive word in that title.

AMERICAN COMMISSION FOR RELIEF IN BELGIUM. See RELIEF FOR WAR VICTIMS.

AMHERST COLLEGE. An institution for higher learning, founded in Amherst, Mass., in 1821. There were enrolled in the several departments of the university in 1914, 414 students, the faculty numbering 43. During the year Professor Grosvenor, who held the chair of Modern Government and International Law, resigned; Raymond G. Gettell, M.A., was appointed lecturer in Social and Economic Institutions; Professor Frederic L. Thompson, the head of the History Department, was given leave of absence for a year, and Dr. Anson Ely Morse, formerly of Marietta College, acted as lecturer in history. The only noteworthy benefaction received during the year was one of \$100,000 to establish the George D. Olds Professorship. The productive funds of the college amounted in 1913-14 to \$2,776,452, and the gross income to \$224,822. The library contains 107,795 volumes. The president is Alexander Meiklejohn.

AMPHOTROPIN. Chemically hexamethylene-tetramine camphorate; it has the chemical formula $((CH_2)_6N_4)_2CH_4(COOH)_2$. The drug is prepared by chemical inter-action of hexamethylene-tetramine and camphoric acid and is claimed to possess the therapeutic quality of both these drugs without producing gastric disturbances. It acts as a urinary antiseptic, increases diuresis and uric acid elimination, and is said to promote the regeneration of epithelium. Amphotropin is a light, white crystalline powder almost insoluble in ether and benzene, but soluble in water, alcohol, and chloroform. The watery solution has an acid reaction. The drug is recommended in infections in the urinary tract, especially in connection with surgical treatment.

ANÆSTHESIA. A new method of rectal anæsthesia was introduced by Gwathmey of New York in 1914. Under the old method ether was

sprayed into the rectum as vapor, and while a satisfactory anæsthesia was obtained, the local after effects were so disagreeable that the procedure was soon abandoned. Gwathmey endeavored to overcome these disadvantages by injecting a mixture of oil and ether, the oil being designed to obviate irritation. It seemed probable, however, that this method would prove unacceptable in the great majority of cases for reasons enumerated below. To many nervous and high-strung patients the procedure with its subsequent proctoscopic examinations possesses so many æsthetic objections that anæsthesia is impossible or brought on only after an unduly prolonged period. During the induction period distressing sensations such as cramps, pressure, and distention in the lower bowel are a further objection. There is also the impossibility of regulating the amount of ether absorbed and the frequent necessity of quickly emptying the lower bowel when anæsthesia becomes dangerously profound. Recovery from the anæsthesia is apt to be very much delayed. In spite of these objections the method presents many advantages. It frees the patient from strangling and the irritating effects of concentrated vapor on the respiratory passages and gives a clear field for the surgeon in operative procedures about the head and neck.

PARAVERTEBRAL ANÆSTHESIA was advocated by Jurasz, who used it in debilitated subjects to whom general anæsthesia was dangerous. Instead of introducing the anæsthetic into the spinal canal, he injected it into the posterior spinal nerve roots on each side from the sixth dorsal to the first lumbar vertebra. Anæsthesia was complete in 10 minutes and there was no operative shock. By this method operations upon the gall-bladder and bile ducts were done, and while the technic is somewhat tedious, the writer believes it may have a life saving value in cases where general anæsthesia cannot be borne.

ANOCI-ASSOCIATION. This method of preventing surgical shock attracted a great deal of comment, mostly favorable, on the part of surgeons during 1914. The method is a combination of local and general anæsthesia as well as the guarding of surgical patients against alarming suggestions and harmful mental impressions. The process consists essentially in an injection of morphine and scopolamin some time previous to the operation; the selection of the safest general anæsthetic possible (nitrous oxide with oxygen being generally preferred); the complete blocking of the nerves supplying the field of operation by the injection of novocain; and finally the infiltration of all tissues which may have been injured by the necessary surgical procedures with a solution of quinine and urea hydrochloride. By these means the patient enters the operating room in a tranquil state of mind, is safeguarded against accidents or consequences of ether anæsthesia, and suffers little, if any, pain. Crile's theories of psychic trauma and its profound consequences were not unreservedly accepted, but the practical application of his method resulted in a diminution of suffering and a higher percentage of recoveries from severe operations. Consult Crile and Lower, *Anoci-Association*. (Philadelphia, 1914.)

LOCAL ANÆSTHESIA is coming more and more into favor, particularly with the French surgeons. At a late session of the *Société de Chirurgie*, Professor Reclus, who originated this mode of anæsthesia 27 years ago, recalled that

he had at that time reported 111 operations done under cocaine. Since the discovery of novocain the method has become a great deal safer. Reclus does all kinds of abdominal operative work, even resections of the intestine, under local anæsthesia. Chaput, Quénu, Tuffier, Lejars, Walther, and other well-known surgeons perform practically every variety of operation by this method, according to their statements.

ANARCHISTS. See **SOCIALISM**.

ANGLICAN CHURCH. See **ENGLAND**, **CHURCH OF**.

ANGOLA. A Portuguese West African colony, with a coast line of over 1000 miles. It is divided into six districts—Congo, Loanda, Benguella, Mossamedes, Huilla, and Lunda. The total area is estimated at nearly 500,000 square miles, and the population at over 5,000,000. The capital is St. Paul de Loanda. The chief products are coffee, rubber, wax, sugar, vegetable oils, coconuts, ivory, oxen, and fish. The rubber supply steadily decreases. The new Lobito-Katanga Railway, 323 miles of which were open to traffic in 1913, was expected to develop the copper industry. In 1910 the imports were valued at 6,022,294 milreis, and the exports at 3,311,863; transit 328,349. The trade for 1912 is unofficially reported, exclusive of Congo, at £1,068,200 imports, and £1,394,200 exports. The trade is principally with Portugal. The colony is administered by a governor-general.

According to English dispatches, an attempt was made by German emissaries, late in 1914, to stir up revolution in Angola, and considerable alarm was felt in Portugal for the security of the colony.

ANNAM. A French protectorate included in French Indo-China (q.v.).

ANTHROPOLOGY. **ANTIQUITY OF MAN AND PHYSICAL ANTHROPOLOGY.** In 1913 the Piltown find divided physical anthropologists into hostile camps—one side contending that the skull discovered had a capacity of about 1076 cc., while the other advocated the view that it attained the figure of 1500, i.e. that of modern European skulls. In 1914 Messrs. Dawson and Smith Woodward, the discoverers, published additional data (*Quar. Journ. Geol. Soc.*, LXX, April), admitting a minor error in reconstruction, but adhering to a very low estimate, but little in excess of that originally made. The nasal bones subsequently found at the Piltown site are described as resembling those of existing Melanesian and African races rather than conforming to the Eurasian type. The canine discovered by Father Teilhard in August, 1913, is larger than any human canine previously found, and illustrates the rule of mammalian paleontology that the permanent teeth of an ancestral race correspond more closely with the milk-teeth than with the permanent teeth of its modified descendants. In the gravel bed of the site four layers are now recognized. The uppermost deposit of surface soil contains pottery and flint tools. Below it is undisturbed gravel ranging from some centimeters to a meter in thickness. There a rude paleolith of Chellean type was unearthed. The third bed contained

supposed eoliths, one clearly worked flint, all the fossils but one, and the human remains under discussion now commonly referred to as *Eoanthropus dawsoni*. The lowest stratum was not fossiliferous, and no implement has been reported from it.

In March, Dr. Hans Reck made a preliminary report of a possibly significant discovery made by him in the course of a geological expedition in northern German East Africa. On the eastern margin of the Serengeti steppe he was able to distinguish a series of five deposits corresponding to climatic changes. In the second lowest horizon a human skeleton was found practically complete. It bore the same relation to the stratified bed as the other mammalian remains, and like them was dug out of the hard clay tuff with hammer and chisel. The human remains are thus coeval with the deposit, and the possibility of an interment seems excluded. An estimate of the age would be premature prior to more thoroughgoing geological investigation, but Dr. Reck is convinced that the skeleton antedates the alluvial or recent period. From a photograph MacCurdy, reporting the case (*Science*, July 3), infers that the affinities of the East African skeleton are with Aurignacian rather than with Neanderthal man.

Of the greatest importance for all students is the standard work published by Prof. Rudolf Martin, *Lehrbuch der Anthropologie*, which for the first time outlines in systematic fashion the methods and technique of physical anthropology. See GEOLOGY.

GENERAL ETHNOLOGY.

The attempt to synthesize, which a few years ago seemed completely swamped by interest in concrete data, now makes itself felt in every field of anthropological work. At the suggestion of Dr. Goldenweiser and under the editorship of Father Schmidt, *Anthropos* has begun an international symposium on "Totemism," of which the contributions by Swanton and Wundt have already appeared, the remainder being apparently delayed by the war. Of wider scope as to subject, but limited to American authorship, is a symposium on the principal phases of American ethnology, summarizing the present status of knowledge as to Religion, Social Organization, Material Culture, Ceremonialism, Mythology, Linguistics. This collection of essays was announced for simultaneous issues of the *American Anthropologist*, and the *Journal of American Folk-Lore*; the July-September number of the *Anthropologist*, containing Swanton and Dixon's "Primitive American History," Holmes's "Areas of American Culture Characterization Tentatively Outlined as an Aid to the Study of Antiquities," and Wissler's "Material Cultures of the North American Indians."

Interest in the fundamental meaning of relationship terms has been reawakened by Rivers's *Kinship and Social Organization* (London, 1914). Rivers attacks Kroeber's view that relationship terminology is primarily a matter of linguistics and psychology. He contends, on the contrary, that it reflects, both in its general character and its details, social institutions, among which forms of marriage have played an important, though not an exclusive, part. Instead of Morgan's two types of kinship terminology, the classificatory and the descriptive,

Rivers distinguishes three distinct forms: the classificatory, our own, and the descriptive. The classificatory system he derives from the institution of exogamy, our own from the family in the customary sense of the term, and the descriptive (for which the Celtic, Scandinavian, Semitic, Shilluk, and Dinka nomenclatures serve as illustrations) from the extended or patriarchal family (*Grossfamilie*). The term "descriptive," which Morgan applied to our own system, seems inappropriate since in our customary nomenclature we no more define relatives by description than the users of classificatory systems. Rivers insists on the failure of psychological grounds to account for features of kinship terminology that become at once intelligible as reflections of social usages. He thus supports one of Morgan's basic assumptions, incidentally pointing out that McLennan, the principal one of Morgan's contemporaneous opponents, also recognized sociological causes, though the particular causes suggested by him differed from Morgan's. On the other hand, Rivers differs from Morgan not only in the classification of nomenclatures, but also in another important point. While Morgan argued from the Hawaiian system to a hypothetical stage of consanguine marriage corresponding to this, in his opinion, most primitive nomenclature, Rivers holds that the system represents a late stage in the development of the classificatory system; and though at this late stage the nomenclature may have reflected promiscuous marital relations there is no evidence that promiscuity was ever the ruling principle of human society.

The school of Graebner, Foy, and Ankermann, which explains all cultural similarities by historical contact, has won a number of adherents, while probably a majority of working ethnologists remain unconvinced so far as the cultural relations of distant continents are concerned. Among the most active defenders, though by no means a slavish disciple, of the "culture-historical" school is Dr. Rivers. In a paper on "The Contact of Peoples" (*Essays and Studies Presented to William Ridgway*) he has made the suggestion that deep and far-reaching changes of culture may be effected by relatively small bodies of wandering people provided their culture embodies elements that seem great and wonderful to the tribes among which they settle. This idea is of some importance for the Graebnerian point of view since it does away with the necessity of assuming vast movements of population and concomitant racial mixture on a large scale. From another starting-point Father Schmidt has brought reinforcements to the historical school by undertaking an intensive ethnographical survey of South America, from the Graebnerian point of view.

While Rivers has given a hypothetical interpretation of the mechanism of cultural transmission, a study of the psychological processes actually found in a concrete case of diffusion has been produced by Radin in "A Sketch of the Peyote Cult of the Winnebago: A Study in Borrowing" (*Journ. of Religious Psychology*, 1914, pp. 1-22). Radin shows clearly that what happened was the automatic organization of the new society in conformity with the norm already established among the Winnebago. The only really new thing introduced was the peyote itself, with its ceremonial eating and consequent physiologico-psychological effects. A similarly

stimulating study by the same author (*Proc. State Hist. Society of Wisconsin* for 1913, p. 137, et seq.) deals with "The Influence of the Whites on Winnebago Culture." This influence proves to have been, apart from material life, essentially indirect. Inter-marriage with whites tended to alter aboriginal rules of descent. The new conditions led to the drawing together into one unit of all the distinct villages, and accordingly to a leveling of intra-tribal differences. Finally, contact between distinct tribes was either established or intensified by the coming of white traders.

In the field of mythology Waterman has re-attacked the problem of "The Explanatory Element in the Folk-Tales of the North American Indians" (*Journal of American Folk-Lore*, 1914, pp. 1-54). He regards folk-tales as having developed independently of the observation of cosmic phenomena, the interest of primitive man centring in his immediate surroundings. Even where natural phenomena do figure in mythology, the explanations appear to be secondary additions to preëxisting tales. This comes out most clearly in the case of widespread tales, since it is obvious that explanatory elements are freely incorporated or dropped in the several versions of the same story. In general, then, the plot is the basic thing, the explanation subordinate and superadded.

Among the general works on primitive religion may be mentioned Frazer's *The Belief in Immortality; and the Worship of the Dead*, vol. i, and E. Sidney Hartland's *Ritual and Belief*.

AMERICA. There has been a strong tendency to establish genetic relationship between languages generally regarded as distinct and thus to simplify the linguistic classification of the North American aborigines. Thus, Sapir (*American Anthropologist*, vol. xv, pp. 617-646) has come to the conclusion that two Californian languages, hitherto regarded as representing distinct stocks, Yurok and Wiyot, are not only genetically connected with each other, but also with the Algonkian family. The relationship is admittedly remote, and the question remains open, whether Yurok and Wiyot together form a group as contrasted with the languages commonly classed as Algonkian, or whether Wiyot, Yurok, and Algonkian proper represent three main branches of a single family. Sapir's conclusions have been vigorously challenged by Michelson (*American Anthropologist*, vol. xvi, p. 361, et seq.), who insists that Sapir has not compared corresponding morphological elements and that consequently the similarities noted are accidental. In California, Dixon and Kroeber (*ib.*, pp. 647-655) have tried to reduce Wintun, Maidu, Yokuts, Miwok, and Costanoan to the position of branches of the "Penutian" family, and similarly unite Shasta, Chimariko, Karok, Pomo, Esselen, and Yuman under the caption of "Hokan family." This classification, if accepted, will reduce the number of Californian stocks from twenty-one to twelve. In another area a synthesis of even greater significance has been attempted by Sapir, who adduces phonological and morphological evidence in support of the oft-asserted but never quite proved unity of Shoshonean and Nahuatl ("Southern Paiute and Nahuatl, a Study in Uto-Aztekan," *Journal de la Société des Americanistes de Paris*, x, 379-425).

Of the works and papers dealing with the ethnography of the American aborigines only a few can find mention here. Among these *The Ammassalik Eskimo*, edited by Thalbitzer and uniting papers on the natives of East Greenland by the editor, Holm, Hansen, et al., occupies a prominent place. Thalbitzer finds among the Ammassalikers evidence for the general homogeneity of Greenland culture. At the same time they represent the most complex of Eskimo communities, owing to the fusion of two streams of culture or immigrants, the one from the west coast by way of the south, the other from the north. Evidence for the latter is found in the presence of Arctic features in the sub-Arctic latitude of Ammassalik. The ice-sealing and hunting methods followed here are even in detail precisely those of northwestern Greenland, while they are unknown in the south. Another high-Arctic complex includes the use of dogs and sledges. On the west coast, south of Holstenborg, these are not found since the snow does not freeze so hard that it is practicable to drive on sledges over great distances. This would of course apply to corresponding stretches of the east coast, and the presence of the dog and sledge in spite of their climatic unfitness indicates that they have persisted from a time when they were used in higher latitudes, especially since the dogs resemble the northwestern breed and are equipped with a similar harness. On the other hand, the extensive reliance on caplin fishing during the hardest winter period, as well as many minor features, point with equal force to influences from a southwestern source. In addition to these views on the Eastern Greenlanders, Thalbitzer elucidates his position with regard to the migrations of the Eskimos as a whole. He holds that the original home of the Greenlanders is to be sought in the Central Eskimo region, that is, in the northern and western part of Hudson Bay, from which they wandered northward and eastward to their present habitat. However, he rejects the theory that this central region was the original starting-point of all the Eskimos. Similarities between the Eskimos of Greenland and those of Alaska, as well as between the common Eskimo culture and that of such Asiatic peoples as the Chukchee, suggest that the pristine Eskimo lived about Bering Strait, coming originally from the coasts of Siberia.

A contribution to the study of Eskimo ceremonialism is supplied by Hawkes's *The Inviting-in Feast of the Alaskan Eskimo*. Stefánsson's *The Stefánsson-Anderson Arctic Expedition of the American Museum*, vol. i, comprises his preliminary ethnological report on the Eskimo of the Coronation Gulf and Mackenzie River districts.

"The Influence of the Horse in the Development of Plains Culture" (*Amer. Anthropol.*, vol. xvi, p. 1, et seq.) has been suggestively discussed by Wissler. The conclusion reached is that the culture found in this area by early observers in the eighteenth and beginning of the nineteenth centuries existed in its elements prior to the introduction of the horse, but was greatly intensified by it, and the typical combination of traits was diffused over a wider area than might otherwise have been the case. In the transmission of the horse culture the Shoshone and related Comanche probably played the principal part.

In an article on "The Cheyenne Medicine Lodge" (*Amer. Anthropol.*, vol. xvi, p. 245, et seq.) Grinnell refutes the belief that the Sun Dance is a ceremony of self-torture. Among the Cheyenne, at all events, it is essentially a prayer for food supply, and torture accompanied it because the festival was considered a favorable time for any performance involving the supplication of supernatural powers. Dealing with the same ceremony among the Crow (*Journ. Amer. Folk-Lore*, vol. xxvii, p. 94, et seq.), Lowie points out that it is a festival that purports to effect revenge on the enemy, but essentially serves the purpose of a popular free show.

Elements of a culture interesting from its transitional nature are described in Skinner's *Political Organization, Cults, and Ceremonies of the Plains-Ojibway and Plains-Cree Indians*. Both these tribes belong to the Algonkian family and share many Eastern Woodland features with their eastern kinsmen, but both have become affected by Plains influence and illustrate the blending of two distinct cultural streams. Thus, both have the police for the buffalo hunt and the Sun Dance, features highly characteristic of the Plains, but also the Midewiwin ceremony of the Central Algonkian. A Cannibal cult with clownish practices is very closely related with a corresponding Assiniboine usage, but there is a possibility of Iroquois influence. The Plains-Ojibway have a social organization similar to that of the Woodland Ojibway, being organized in totemic gentes, but among the Western Cree no sure evidence of such social groups has been discovered. In another paper dealing with the "Social Life and Ceremonial Bundles of the Menomini Indians," Skinner gives an account of a typical Central Algonkian tribe. Several contributions to our knowledge of the Algonkian Woodland area have also been made under the auspices of the Geological Survey of Canada. These include: Speck's "The Double-Curve Motive in Northeastern Algonkian Art"; Radin's "Some Myths and Tales of the Ojibwa of South-eastern Ontario"; and Mechling's "Malecite Tales."

The Pueblo area has received attention in Dr. Hough's archaeological report on the "Culture of the Ancient Pueblos of the Upper Gila River Region," while a most convenient summary of what is known of ancient Mexican and Maya culture is supplied by Joyce's "Mexican Archaeology."

AFRICA. Professor Westermarck, whose theoretical works on the development of human marriage and ethics have made him world-famous, has at last appeared in the guise of a field-ethnographer, his book on *Marriage Ceremonies in Morocco* containing part of the information secured during a stay in northern Africa. The undrained region of German East Africa is described by Dr. Reche, who bases his paper, *Zur Ethnographie des abflusslosen Gebiets Deutsch-Ostafrikas*, on the records and specimens of the Obst expedition. He discovers several cultural layers corresponding to as many waves of migration. A primeval race of hunting Pygmies was subjugated or superseded by the horticultural Bantu, who in turn were followed by pastoral Hamitic populations. Last of all came the Masai, whose influence, however, has been largely external. N. W. Thomas, the Government Anthropologist in Nigeria, continues his *Anthropological Report on the Ibo-speaking Peoples*,

which embodies much linguistic and ethnographic information.

Since the Bushmen and Pygmies are both commonly regarded as part of the autochthonous African population, their genetic relationship, as well as the relationship of their several subdivisions to one another, constitutes a problem of basic importance. It has been attacked by Kuhn (*Zeitschrift für Ethnologie*, 1914, pp. 116-136), and Von Luschan (*ib.*, pp. 154-176). Kuhn, who had occasion to observe both Bushmen of southwest Africa, and Babinga Pygmies of the Sanga River, Kamerun, is impressed with the resemblance of the two groups and postulates a close connection. The stature of the Sanga River tribes averages 154 cm. for the males, 146.9 cm. for the females. In skin color they also resemble the Bushmen, though the latter are of somewhat lighter shade; prognathism is developed in equal measure, and the nose is sharply divided from the forehead. On the other hand, there are a number of significant differences. The Babinga are much heavier and stronger, the cephalic index is higher (79.44 against 76.3 for men; and 77.96 against 73.5 for women), and the nose is excessively wide and thick, with a relatively high bridge. Von Luschan also strongly supports the theory of the unity of the Bushmen and Pygmy race; points of difference are explained as largely due to Hottentot influence. Among the traits common to both he enumerates the short stature, with disproportionately long trunk as compared with the short extremities; the wrinkled skin; spirally coiled hair; convex upper lip; and tremendous bigonial breadth, giving a rectangular character to the face. The points of difference include the form of the ear, which is less peculiar among the Pygmies, who rarely lack the lobe; the color of the skin has a far greater range of variation among the Pygmies, being sometimes of a pale reddish-yellow and sometimes sooty black.

OCEANIA AND ASIA. One of the events of the year is the publication of *Native Tribes of the Northern Territory of Australia*, by Prof. Baldwin Spencer, whose work on the aborigines of Central Australia, issued fifteen years ago in collaboration with the late Mr. Gillen, roused as much discussion as has ever been evoked by a purely descriptive ethnographical monograph. Comprising in a rapid survey a considerable number of distinct tribes, Professor Spencer devotes a large section of his new book to the Kakadu of the Alligator Rivers region, as well as to the Melville and Bathurst Islanders. The latter are physically the best developed of Australian natives, many of the men attaining a stature of five feet ten, or even six feet; in marked contrast, to be sure, are the stunted figures of their women, whose height seldom exceeds four feet eight. The hair varies considerably as to degree of waviness and curliness, but is never woolly. As in the case of the aborigines previously described, the terms "paleolith" and "neolith" seem quite inapplicable to the stone implements found in use. The nature of these seems to depend solely on the character of the available material: where only quartzite occurs, the Australian merely chips or flakes the stone, while if diorite can be secured he will grind it. Thus the same native may be found using implements which would be assigned to distinct epochs by a European archaeologist. The social organization of the tribes described varies remarkably.

While totemic groups occur throughout the territory, they often regulate marriage only as subdivisions of larger marriage-regulating units, and in other cases not at all. These larger units are usually the familiar eight classes of Central Australia, divided between two exogamous moieties. However, the class and moiety system is absent among the Kakadu and the Islanders, the latter being organized in purely local groups. Among the Waduman and related tribes there is the anomalous combination of paternal descent of the class name with maternal descent of the totem. As elsewhere in Australia, the admission to an adult man's status figures prominently among ceremonial procedures; among the Kakadu, indeed, there are no less than five grades of initiation. The Kakadu and the Island tribes differ markedly from most of the other natives in lacking both the circumcision and subincision features that characterize initiation in the central area. The Islanders' ceremony is unique in having women admitted to participation, since elsewhere in Australia they are rigidly debarred from attending even as spectators, on pain of death. The interment ritual of Bathurst and Melville Island is likewise highly distinctive. Tree-burial is unknown, bodies are always buried in the ground, and grave posts, curiously carved and decorated with paint, are set round the remains. In decorative art these Islanders show so little kinship with other Australians as to suggest outside influence from the northeast. The Kakadu are remarkable for the excellence of their bark and rock drawings, in which the fauna of the region is often represented with great realism.

A comprehensive work on the material culture of the region, with special attention to the substances used, has been published by the pioneer traveler Finsch under the caption of *Südseearbeiten*. Much-needed information on the New Hebrides is supplied by Speiser in his *Südsee-Urwald Kannibalen*. His most important discovery, if corroborated by further research, is that of a pygmy race, clearly distinct from, though largely blended with, the taller Melanesian populations. The men average only 152 cm. in stature, the women 144 cm. The hair is frizzy and of a dark yellowish-brown color; in contrast to the Melanesians the beard is but slightly developed. In point of skin color the Pygmies are lighter than the taller tribes, and the skull is markedly less theromorphic. Culturally, the Pygmies also present notable peculiarities. Unlike their neighbors they use feathered arrows, do not perforate the septum of the nose, or practice any other bodily deformation except for occasional piercing of the ear lobes, and in their social life they do not carry out the rigid separation of the sexes so noticeable in the tribal life of Melanesia. While they subsist only in small measure on yams, they not only cultivate taro, but also have a knowledge of irrigation. A welcome supplement to Speiser's book is constituted by the French missionary Suas's "Notes ethnographiques sur les indigènes des Nouvelles Hebrides" (begun in *Anthropos*, ix, pp. 241-260).

The social and religious conceptions of the Marshall Islanders, another practically unknown subject, has at last found treatment in Erdland's *Die Marshall-Insulaner*. Erdland discovered an exogamous system with maternal descent and traces of totemism. The kinship system is of

the so-called classificatory type, more particularly, it seems to be of Hawaiian form, and the occurrence of cross-cousin marriages is especially suggestive in view of their wide distribution in Melanesia.

Finley and Churchill describe the ethnology and linguistics of *The Subanu*, a tribe inhabiting a district of Mindanao. Anthropological work in Nias, near Sumatra, had practically lapsed since Modigliani's book of more than two decades ago, but is now being resumed by a Dutch scholar, Kleiweg de Zwaan, who has issued two volumes dealing with the primitive medical practice and physical anthropology of the natives: *Die Insel Nias bei Sumatra*. In Celebes the Sarasin cousins find a worthy continuator of their researches in Professor Grubauer, who has written a profusely illustrated book, *Unter Kopffägern in Zentral-Celebes*.

MEETINGS, EXPEDITIONS, PERSONALIA. The one meeting of overshadowing importance for which preparations had been made throughout the year, the nineteenth International Americanist Congress, which was to assemble in Washington, D. C., October 5-10, had to be postponed indefinitely on account of the European War. The American Anthropological Association met in Philadelphia, December 28-31, in conjunction with Section H of the American Association for the Advancement of Science, and the American Folk-Lore Society.

The Bureau of American Ethnology continued to support work on Algonkian linguistics by Dr. Michelson, and on Indian music by Miss Denmore, who visited the Ute Indians; Professor Boas visited the Kootenay for linguistic studies. The Geological Survey of Canada equipped expeditions to the Central and Labrador Eskimo (Mr. Hawkes); to the Iroquois (Dr. Goldenweiser); to the Eastern Dakota (Mr. Wallis). Under the auspices of the American Museum of Natural History, Dr. Wissler and Mr. Murie investigated the ceremonial life of the Pawnee; Dr. Goddard visited the San Carlos Apache; Dr. Spinden undertook a reconnaissance of Central American antiquities; Mr. Nelson resumed archaeological work in the Galisteo Basin; Mr. Skinner began an investigation of the Southern Siouan tribes and the Eastern Dakota; and Dr. Lowie commenced work on the Northern Paiute. Under the leadership of Dr. Farabee, the University of Pennsylvania Museum maintained explorations in Southern British Guiana and Northern Brazil, while Mr. M. R. Harrington spent the summer among the Ponca and examined Oklahoma rock-shelters. In the interests of the Heye Museum, Professor Saville conducted archaeological work in Ecuador and Colombia. The Peabody Museum of Harvard supported a Central American expedition by Messrs. Merwin and Bishop; archaeological excavations in Nebraska by Mr. Stearns.

Outside of America, Sir Aurel Stein has resumed archaeological researches in Central Asia and westernmost China; Miss Czaplicka visited the Tungus and the Ostiak of the Yenisei River; Dr. Preuss is engaged in archaeological and ethnological work in Colombia; Dr. Rivers utilized his attendance at the Australian meeting of the British Association for the Advancement of Science for supplementary work on Melanesian ethnology. See PEABODY MUSEUM.

ANTIGUA. A West Indian island, constituting, with Barbuda and Redonda, a presidency

of the Leeward Islands colony. The area of Antigua is 108 square miles, with a population of 31,394—1099 white, 26,458 black, 3927 colored. Barbuda (871 inhabitants) and Redonda (120) have a total area of 62½ square miles. The capital, St. John, is also the capital of the colony. Antigua was discovered by Columbus in 1493, and named by him after a church in Seville. It is subject to frequent droughts, there being no rivers in the island. The chief products for export are sugar, cotton, and pineapples. The output of sugar in 1913 was 11,696 tons; of molasses, 5267 puncheons; of cotton, 444,826 pounds. The total imports for 1912 were valued at £168,274 (£181,331 in 1911); exports, £164,968 (£151,064). These figures are exclusive of internal trade. Total tonnage entered and cleared, 653,355, of which 582,723 tons were British. Revenue, 1912-13, £53,489 (£52,292 in 1911-12); expenditure, £53,193 (£53,652). The total customs revenue in 1912-13 was £31,961. The public debt stood in 1912 at £123,500; amount to credit of sinking fund, £42,920. Antigua is under the direct administration of the governor of the colony. See **LEEWARD ISLANDS**.

ANTIMILITARISM. See **ITALY, History**; **JAPAN**; and **SOCIALISM, passim**.

ANTITOXIN. Schick and his associates in Von Pirquet's clinic in Vienna contributed valuable information as to the dosage of antitoxin. To obtain the exact amount of antitoxin needed for neutralizing diphtheritic poisons, they find it necessary to calculate the dose according to the body weight. The best immunizing effect was derived from a dose of 100 units per kilogram of the patient's weight. When this quantity was used a subsequent injection 24 hours later did not increase the immunizing effect. Schick's observations indicated that repeated injections of the serum were superfluous and unwarranted. Even in the severest cases, if a dose of 500 units per kilogram be injected immediately the greatest effect possible will be obtained. Subsequent injections of antitoxin after 6, 12 or 24 hours are unnecessary. If the conclusions drawn by Schick are correct, it is obvious that the practitioner will be provided with a precise method of treating diphtheria patients. It would seem that the enormous doses sometimes given of 100,000 units, or more, of antitoxin are wholly unnecessary, involving large expense and much inconvenience to the patient, especially where repeated injections have to be given.

The presence of natural antitoxin in the blood of certain individuals had long been suspected. It was only recently, however, that Romer discovered a method by means of which it is possible to determine accurately the precise amount. His method consists of injecting into guineapigs, minute quantities of diphtheria toxin and the serum to be tested until a balance is secured, the diphtheria toxin completely neutralized, and no necrosis takes place. By this method Otto has tested the serum of a large number of people with interesting results. He found that there was a large amount of antitoxin in the blood of persons such as doctors and nurses who had been in close contact with diphtheria cases, while others had much less. He found also that diphtheria carriers, whether they had suffered from the disease or not, contained more antitoxin in their blood than patients who had recently recovered from an at-

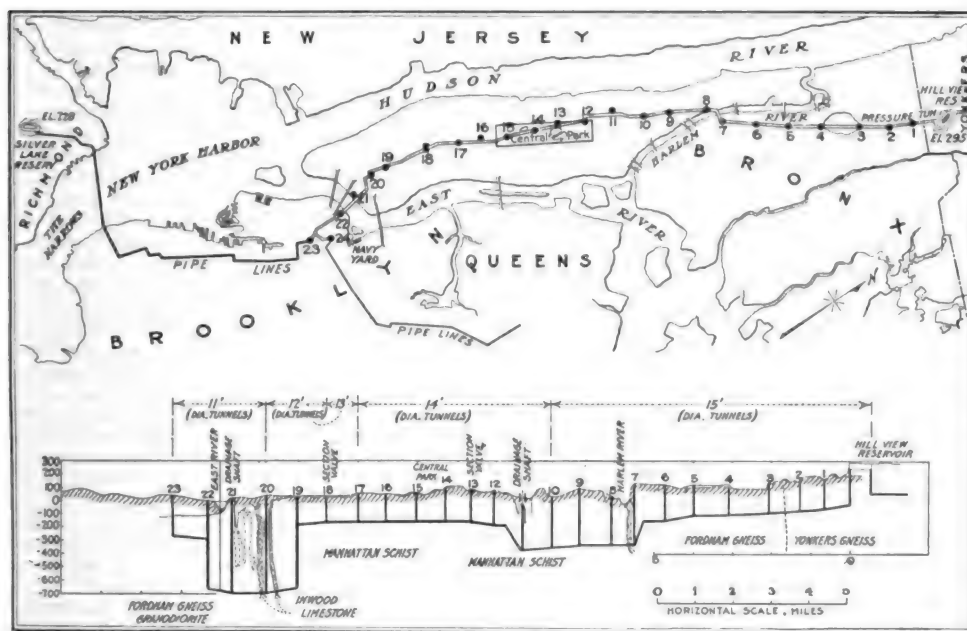

tack of diphtheria. Evidently the presence of the bacilli in the throat stimulates the production of a natural antitoxin, that is, it increases the immunity of the individual. It was also believed that antitoxin may be transmitted from the mother to the child. In the blood of 80 per cent of new-born babies it is found, but it soon disappears. The condition is one of relative immunity, and while it accounts for the resistance of many persons to the disease, will not render the use of antitoxin in diphtheria any less imperative. Antitoxin was given by intravenous injection during an epidemic of diphtheria in Bremen during the winter of 1913. This method was quicker in its results than the usual procedure, that of injecting the substance into the muscles. It was observed also that the effect was many times greater. Serum sickness was no more severe than with ordinary method. See **DIPHTHERIA**.

AOKI, SIUZO, Viscount. A Japanese diplomat, died Feb. 16, 1914. He was born in 1844, the son of a Japanese physician. After studying law and the political sciences in the University of Tokyo in 1868, he went to Germany to complete his education. Returning to Japan he entered the diplomatic service and in 1873 was attached to the Japanese Legation at Berlin as secretary. In the following year he was commissioned minister to Germany, being at that time only 30 years of age. He was the youngest diplomat ever appointed to the German Empire. In 1885 he left this post to become Vice-Minister of Foreign Affairs, and four years afterwards was raised to the rank of a viscount. After the retirement of Count Okuma, in consequence of an attack upon his life, Viscount Aoki became Minister of Foreign Affairs. He at once began negotiations for the revision of treaties with various foreign powers. This work was completed in 1891 and in the same year he retired from the Cabinet. This retirement with that of other members of the Cabinet was caused by a controversy which followed an attack upon the Czarévitch, afterwards Nicholas II of Russia, who was at that time traveling in Japan. One year later Aoki was appointed minister to Germany, and in 1894 received the additional post of minister to England as well. While minister to England he became acquainted with Baroness Elizabeth von Rathen, the widowed daughter of one of the proudest families of Pomerania, and the two became engaged, and shortly afterwards married. The announcement of their engagement and marriage aroused a storm of discussion in Germany, and the wedding is said to have been opposed by many persons of distinction in that country. About five years later Aoki was called home by the Emperor and was made one of the privy councilors. In 1905 he was appointed Ambassador to the United States and was the first Japanese ambassador to that country, as Japan had been previously represented only by a minister. He remained at Washington until 1909. As ambassador he was for the most part successful, but he was severely criticised in Japan for his failure to prevent President Roosevelt from sending the American fleet around the world in 1908. In some quarters of Japan this trip of the fleet was regarded as intended to have an effect on the warlike spirit of that country. On his return to Japan he continued to be one of the privy councilors, but held no official post thereafter.

APPLE SIRUP. See HORTICULTURE.

AQUEDUCTS. Except for the completion of a few notable structures, such as the Kensico Dam and Reservoir, and the distributing reservoir at Hill View, the great Catskill Aqueduct, which will supply New York with 500,000,000 gallons of water a day, was reaching its finishing stage. The 90-mile aqueduct had been virtually completed and the 12-foot tunnel several hundred feet below the surface of Manhattan Island and extending to Brooklyn had been excavated and lined, though the distributing equipment at the various shafts had not been installed. At several points along the line additional work on improvements remained to be effected, such as the change in the siphon, where it passes under the Hudson River at Storm King, but these details were essentially minor, and at short notice the aqueduct could be connected with the Croton supply system and any danger

depth of 1100 feet below the water surface. This connects with the shafts reaching to the surface. On the west side of the river, at a depth of about 228 feet below the water level, or 270 feet from the surface of the ground, connection is made with a tunnel extending westerly, which was tunneled under the solid rock under Storm King Mountain. The west shaft was sunk as a test shaft in order to determine the nature of the material likely to be encountered in the construction of the siphon, but as soon as the water-tight rock was developed it was used as part of the aqueduct to save the expense of sinking another shaft further west. This shaft was finished and newly lined, and when it was subjected to more water pressure, it was found that there was considerable leakage beneath the western shaft and the next shaft 125 feet west of it. When the tunnel was pumped dry it was found that there had been a yielding of the rock at

PLAN AND SECTION OF PRESSURE TUNNEL UNDER NEW YORK CITY.

From Engineering News.

of failure of water supply to the City of New York on account of drought be eliminated.

An interesting development of the Catskill Aqueduct was the driving of a new shaft and tunnel, the former of 400 feet depth, and the latter of 900 feet in length, to supplement the existing Catskill Aqueduct on the west shore of the Hudson River at Storm King Mountain. This is a portion of the rock tunnel under the Hudson River, a type of work that can be successfully used only where the rock is solid and unyielding, and the concrete lining is added simply to make the rock more water-tight and to furnish a smooth surface for the flow of the water, as the pressure acting on the walls of the tunnel, which is 14 feet in diameter, has the pressure equivalent to a head of several hundred feet, and would of course break the concrete lining. Where the aqueduct passes under the Hudson River the rock tunnel had been driven to a

certain points, and the concrete lining had been cracked to a very small degree, but sufficient to permit the escape of a quantity of water. While this was not particularly serious, it indicated a possible wasting that might increase, and accordingly it was determined to abandon the use of that part of the west shaft nearest the surface and a portion of the pressure tunnel. Accordingly it was decided to go back 900 feet into solid rock of Storm King Mountain, and make a shaft 400 feet in depth, and drive a longitudinal tunnel 900 feet, connecting with the tunnel under the Hudson River. The result of this will be to carry the aqueduct so far below the surface of the ground that no movement of the rock under the great hydrostatic pressure need be feared. Contracts accordingly were made in October providing for the completion of the work within one year. As the possibility of a shortage in the Croton supply might occur in

the following year, it would be possible to use temporarily the Catskill Aqueduct with the old shaft.

Progress was made during the year with a novel plan of construction to carry a pipe-line from Brooklyn to Staten Island across the Narrows, the channel connecting the Upper and Lower Bays. A submarine pipe-line was adopted in preference to a tunnel, after the merits of both systems were thoroughly canvassed, and the decision was in favor of the former. The distance from shore to shore is about 10,000 feet, and this was being crossed with 36-inch cast-

the centre of the valley where the line crosses a ravine were undermined and fell on their sides. The siphon was ruptured so that the water flowed out under very high velocity, and immediately there followed a collapse of some 1000 feet of the line of pipe as the result of the pressure of the atmosphere. The collapse occurred in the upper half of the steel pipe, the lower half being buried in the ground. From a cylindrical cross section the line was changed to U-shape, and while at several points plates were torn and rivets sheared, the pipe in the main held up satisfactorily. The method of repair was about as novel as the accident itself. New plates to replace those torn were rolled, sheared, and punched, and transported by wagon 35 miles across the desert to their destination, and riveted into place. In the meantime new piers of concrete had been built, and when everything was in readiness, the water was turned into the line, and the head gradually increased until the pipe was forced by the pressure into its usual form. In this process none of the longitudinal seams were sheared, and but a small amount of calking of such seams was required. In some cases stretches of from 400 to 500 feet of pipe were restored to rotundity with no damage whatever. The entire repair, including cost of fitting in new plates, building cement piers, and providing against a repetition of the accident, did not involve an expense of more than \$2200.

Of somewhat different nature from the aqueducts at New York and Los Angeles were the new intakes, which were being constructed to furnish additional supplies of lake water to Milwaukee and Cleveland. The latter construction will be recalled as a few years previously, when the tunnel for the aqueduct was being driven through a stiff clay containing marsh gas, there resulted a great loss of life. It was admitted probably, however, that the advance made in modern methods of tunnel excavation with boring machines would prevent similar accidents in the work under hand. The new tunnel, 3 miles in length, was being driven from a crib $1\frac{1}{2}$ miles off shore to a new crib nearly 4 miles off shore. It was 10 feet in diameter, being lined with large concrete blocks placed with a special erector following the tunneling machine.

CANADA. The city of Victoria was building an aqueduct supplied by a minor reservoir, 37 miles away, while the city of Winnipeg was engaged in a project to take the soft water of Shoal Lake, 95 miles to the east. Other Canadian cities were engaged in ambitious projects for the extension of their water supplies, as the rapidly growing populations made necessary such improvements. At Ottawa in particular there was much discussion during the year of new or improved water supply, on account of an increase in fire insurance rates. Financial conditions did not seem to permit of the construction of new aqueducts from distant sources of supply as proposed by engineers, and at the end of the year it was proposed to retain and increase the present unfiltered supply from the Ottawa River, building a high-pressure pumping station on Lemieux Island.

ENGLAND. The Metropolitan Water Board of London in 1914 let a contract for two storage reservoirs in the Thames Valley, near Laleham and Littleton, with an aggregate capacity of 7,000,000,000 gallons, and also contracts for a service reservoir at Shooter's Hill to contain ap-

SECTION OF PRESSURE TUNNEL.

From Engineering News.

iron pipe laid in 12-foot sections with a carefully designed flexible joint. The depth of water in some places at the crossing is as great as 74 feet, and this together with the large number of passing ships presented no small amount of difficulty. A trench for the pipe was first dredged at the bottom, and then from a large scow, which carried a 60-ton structural steel cradle 180 feet in length, extending to the harbor bottom and carrying an inclined skidway, the pipe was slid into place, its joints being made above water on the scow, which was then moved forward so that the pipe would be lowered to rest in its proper position. The joint employed is a modification of the Duane joint, and resulted in a reasonable degree of water-tightness, through a method of construction evolved after elaborate testing. After the lead is poured into the joints hot, cold lead pellets are forced in through jib screw holes in the joint, increasing the amount of lead without destroying the flexibility and producing a joint which is not only tight, flexible, and strong longitudinally, but will stand considerable abuse. The type of joint used had never been employed before; so accordingly a certain section was submitted to both hydrostatic and air-pressure tests, which proved eminently satisfactory.

LOS ANGELES AQUEDUCT. An interesting failure of the steel pipe siphon of the Los Angeles Aqueduct, where it crosses the Antelope Valley about 100 miles northwest of Los Angeles, took place on the night of February 20. There had been three days of heavy rainfall and the two concrete piers which supported the siphon near

proximately 1,000,000 gallons, and at Westerham Hill and Betsom's Hill, each to contain 300,000 gallons. A tunnel of 16 feet internal diameter, and lined with cast-iron segments, was driven through the clay under the Thames between Twickenham and Richmond, and at the end of the year the contractors were laying three lines of 36-inch pipe, and one line of 30-inch steel pipe. The aqueduct, which provides the city of Manchester, England, with the third installment of water from Thirlmere, was practically completed during the year, and the 30 siphons across the various valleys on the route were tested as well as the subway under the ship canal near Barton. The Manchester water works improvement included the construction of the Heaton Park Reservoir, and the completion of the inlet and outlet works, straining wells, etc. This reservoir when completed was to have a top water area of nearly 80 acres. See WATER PURIFICATION.

AQUITANIA. See SHIPBUILDING.

ARBITRATION, INTERNATIONAL. See INTERNATIONAL ARBITRATION AND PEACE.

ARBITRATION AND CONCILIATION, INDUSTRIAL. The exceptional unrest among the working classes in recent years has given rise to a considerable number of labor disputes, strikes, and lockouts. (See STRIKES AND LOCKOUTS.) Some means of obviating such interruptions in business and the attendant losses is one of the problems confronting society. Now it is coming to be generally recognized that much can be saved to both the employer, the employee, and to the public by means of conciliation and arbitration in industrial disputes. Especially from the point of view of the latter is this matter becoming of supreme importance. Because of the interdependence of the various industries members of any community are, to a greater or less extent, dependent on their transportation, lighting and other public utility corporations, and any interruption in the normal administration of the facilities operated by them works considerable hardship on the people. Furthermore, the public is learning that the consumers-at-large must ultimately pay by the advanced prices of commodities, and the increase of poor-relief. So there has been a growing conviction that some governmental machinery should be established to guarantee the continuance of industry pending the settlement of industrial disputes.

Australia and New Zealand have introduced systems of compulsory arbitration, but in the United States, however, there has been no body of public opinion to uphold such a means of settlement. The American Federation of Labor (q.v.) has openly expressed its objection to any such method, and in the hearings of the Industrial Relations Commission (q.v.) union men expressed themselves as opposed to arbitration in which an umpire is involved. The employers also were quite in agreement with this position, both contending that an outsider has not the requisite knowledge, and his decision is usually unsatisfactory. By the Newlands Act passed in 1913 a Federal Board of Mediation and Conciliation was established in the United States, and several commonwealths have similar commissions or have enacted provisions for arbitration.

Secretary of Labor Wilson in his 1914 report stated that it is the policy of the department to

intervene in labor disputes only when called upon; it will, however, in critical situations, take steps on its own initiative.

As an instance of the huge sums saved through mediation, the Massachusetts Board of Arbitration and Conciliation stated in its annual report that twelve million dollars were saved through its efforts during 1914.

LEGISLATION. Alaska passed a most elaborate law relating to the arbitration of trade disputes. The Governor is enjoined to endeavor to settle by mediation, either personally or through a commission, disputes concerning wages, hours of labor, or conditions of employment which interrupt or threaten the interruption of business. In the event of the failure of such an effort, the Governor is to try to bring about arbitration by a board of three persons, one to be chosen by the employer, one by the union or unions concerned, and these two are to appoint a third. The majority of the conciliators may make a binding award. Hearings are to commence soon after the appointment of the third arbitrator and the award is to be made within thirty days, the status existing before the dispute to remain unchanged during arbitration. The award as well as the papers in the proceedings are to be filed with the district court; and, unless error is found, this decision shall be final and the parties are to abide by it. If, however, there is dissatisfaction with the ruling, for three months after it has been made—except on thirty days' notice—the employer is not to discharge men except for inefficiency, violation of the law, neglect of duty, or because fewer workers are required. On the other hand, the employees are not to stop work without good reason during the same time. Such an award is to remain in force for one year and unless set aside, no new arbitration on the same question can be obtained during that period. The arbitrators are empowered to administer oaths, to require the attendance of witnesses, and to demand that the necessary documents be produced. Their expenses and compensation are to be arranged for in the terms of the agreement to arbitrate. Provisions are included in the law which make possible appeal to the court on questions of law only.

Massachusetts amended her law governing the State Board of Conciliation and Arbitration so as to make investigations of labor troubles by the board dependent upon the inability of the parties to settle, or their refusal to submit the matters to arbitration. Experts to assist in the investigation may be employed and local boards of conciliation may be composed of three mutually agreed upon, as well as one representative each of the employer, employee, and the public.

PHILADELPHIA GARMENT MAKERS. A notable instance of the effectiveness of mediation was the agreement reached between the employers and the unions in the garment trades in Philadelphia during September. This action averted what promised to be a serious strike involving 6000 employees and 140 employers, the purpose of the strike being to secure the same standards for the smaller shops that the larger shops now have.

WESTERN LOCOMOTIVE ENGINEERS. After the members of the Federal Board of Mediation and Conciliation had reported that efforts in conference with representatives of the locomotive engineers and firemen of 98 railroads west of

Chicago had failed, President Wilson intervened and induced the workmen and companies to arbitrate. The men had decided to strike in August, but gave up their plan, and on November 30 hearings were begun before the Arbitration Board named under the provisions of the Newlands Act. The arbitrators chosen were: Judge P. C. Pritchard and Charles Nagel, appointed by the Government; F. A. Burgess and Timothy Shea, representing the employees; and W. L. Park, and H. E. Bryan, the railroads. The unions demanded a standard rate of wages, and a standard day with rates for overtime. They asked a five-hour day in passenger service and a ten-hour basis in the freight service. They would also have the "extra men" remunerated on the basis of a through rate pay, and have the "surprise test" eliminated. There are about 64,000 men involved and it is stated that should the workers be successful nearly \$33,000,000 annually would be added to the payrolls of the company. It is expected that the awards will be completed early in 1915.

GEORGIA AND FLORIDA RAILWAY CASE. After the employees of the Georgia and Florida Railway had entered into negotiations with the general manager for increased wages and better working conditions, the latter proposed to submit the matter to arbitration. This was done and Mr. L. S. Davis, general chairman of the Brotherhood of Locomotive Engineers, was chosen to represent the employees, Mr. A. W. Anderson, a railroad manager, for the company, and Judge S. J. Peelle, of Washington, D. C., was picked by the United States Board of Mediation and Conciliation as the third arbitrator. The board met in Augusta, and on April 28 hearings were begun. The employees contended that their rates of pay were below those of other roads in the same section of the country. The railway company, on the other hand, maintained that although these wages were lower the physical conditions were better and the responsibilities imposed upon the workers less. The award granted the employees an increase of about 12 per cent in wages, but Mr. Anderson dissented from this on the grounds that the company was unable to meet its operating expenses. A bill of exceptions was filed in the United States District Court but was dismissed and the award confirmed, and in an appeal to the Circuit Court of Appeals this decision was again upheld.

KANAWHA COAL STRIKE. This dispute, which began in April, had been in progress for two months when the Department of Labor stepped in at the request of the employers for an investigation of conditions. It was contended by the operators that organized labor had demanded that \$1 or \$2 a month should be sent for each employee—the money to be taken from their pay—to the officers of the United Mine Workers at Indianapolis. However, representatives of the United Mine Workers denied this, stating that they merely asked for a voluntary "check-off" of dues, and accepted mediation. Three commissioners of conciliation, made up of one miner, a coal operator, and A. L. Faulkner, immigrant inspector at Cleveland, were appointed. It was agreed by both sides that the men should return to work at the same wages that were paid before the outbreak of the strike; that by the authority of the individual workers given in writing a sum not to exceed \$1.10 per month

should be paid to the treasurer of the local union of the United Mine Workers of America by the "check-off" system; and that a commission to investigate and determine wages and grievances was to be chosen. These recommendations were adopted by the operators and the union, the action of the latter being ratified by the convention of miners held at Charleston, W. Va.

INDIANAPOLIS STRIKE. In February the award of the Indiana Public Service Commission, which acted as a board of arbitrators in the Indianapolis Street Car Strike, begun on Nov. 1, 1913, was made. The conditions of the employees were ameliorated, although not one of the several grievances submitted by the employees was fully recognized. Minimum and maximum rates of wages such as had existed before, were retained, but these were raised to 21 cents, a 5 per cent increase, and 28 cents respectively. Those employees known as "extra men" are to receive a guaranteed minimum of \$45 a month. Benefit is also to accrue to the workers in many other ways. There is to be no discrimination against union men. This is of great significance, for nearly all the employees were reported to be members of the Street Car Men's Union. Definite assurances were given that future grievances will be heard and the hours and conditions of service improved. This award is to hold until Nov. 7, 1916. Provision has been made for the settling of any future dispute or grievances coming as a result of the award, by means of a permanent court of arbitration of three members, to be appointed by the United States District Justice for Indiana, the chief justice of the Appellate Court, and chief justice of the Supreme Court, each to choose one.

The strike from which this award arose, began on Nov. 1, 1913, and tied up the entire street railway system of Indianapolis. Much violence succeeded an attempt to import strike-breakers and during the rioting four persons were killed and several injured. Several of the policemen in the city resigned rather than protect the strike-breakers, while 200 citizens refused to act as deputies when called upon to do so. On the ground that citizens had not done their duty the Governor at first refused assistance but afterwards ordered the National Guard of Indiana to the scene. The strike engendered such bitter feeling that Mayor Shank finally resigned, because of it and of his inability to prevent the teamsters' strike. It is expected that as an outcome of this dispute Indiana will pass a comprehensive arbitration law, which will provide for the compulsory investigation of strike grievances.

TUGBOAT-TOWING INTERESTS ON THE GREAT LAKES. This case was the outcome of a decision of the United States District Court which held that the time spent in awaiting orders or taking on supplies should be counted in with the hours of navigation. Now, the licenses granted by the Steamboat-Inspection Service of the Department of Commerce require double crews for all boats or tugs, with the exception of those navigated only 13 hours out of the 24. Had the loading hours been included in the total time, many of the tugs would have been engaged in actual navigation more than 13 hours, and by the above interpretation would be required to have double crews. An agreement reached

in February, 1914, between the owners and the International Longshoremen's Association before this decision was rendered and under conditions existing previous to it, had, therefore, to be modified. The tug men, however, objected strenuously to double crews, maintaining that it involved the probability of one crew being compelled to sleep aboard the tug while the other was operating it, thereby subjecting the men to great peril. They also contended that there would result unsanitary conditions and great inconveniences to the laborers, because bunks would be used continuously by one crew after the other. The owners, on the other hand, were unwilling to consent to the limitation of the use of their boats to 12 hours a day. It was under these conditions that the Board of Conciliation intervened, and an agreement was finally reached on May 16, 1914. Provisions were that the tugs should be made available for the full length of time for service with single crews, and that the tug-men's unions should furnish the laborers necessary to man the boats for the whole 24 hours.

Among the more important minor arbitrations during the year, not mentioned above, were the following: On January 18 a settlement was reached in a very short time between 5000 employees of the Delaware and Hudson Railroad who had gone on strike because of the discharge of two union men, and the owners, through the intervention of the Federal Board of Mediation and Conciliation. Small increases in wages aggregating \$100,000 and a minimum wage for passenger trainmen, were granted the workers of the Chicago, Burlington & Quincy Railroad. John A. Moffitt and James A. Smith were detailed to investigate a strike of the machinists of the Universal Bottle-Washing Machine Co. of Detroit, and they succeeded in bringing about a settlement through the recognition of the Machinists' Union, the reduction of the hours of work, and an increase in wages. As a result of the efforts of these same commissioners, strikes were averted in the shops of the Lake Erie and Western Railroad and Michigan Central Railroad; and similar pressure in the machinists' strike in Trenton, N. J. brought about a peaceful settlement of what promised to be a serious situation. Satisfactory adjustments were also reached in the Louisville and Nashville Railroad shops, among the sawmill workers of Washington, and in the longshoremen wage dispute in Texas. Mediation, though, was unsuccessful in the Calumet and the Colorado strikes. See STRIKES AND LOCKOUTS.

GREAT BRITAIN. Great strides have been taken in recent years in the matter of settlement of trade disputes in Great Britain. The Board of Trade was authorized in 1896 to act as an agency of mediation and, in 1908, a permanent court of arbitration was established. As a result of the extensive and stubborn labor contest some three years later, an Industrial Council was created. This now consists of 13 representatives of employers, an equal number for the workmen, and has Sir George Askwith as its chairman. There are several voluntary conciliation boards and standing joint committees in existence throughout the country. In July, 1913, the Industrial Council submitted a report declaring emphatically that the principle of collective bargaining should not be called in question, and suggested that provision

be made for the submission of disputes to a third party, where the ordinary machinery of arbitration has failed; but compulsory arbitration was not advised.

BIRMINGHAM STRIKE. The strike of the unskilled union workers in the vicinity of Birmingham involving 36,000 men was settled last spring through the intervention of Sir George Askwith of the British Board of Trade. A minimum wage of \$5.60, the principal demand of the strikers, was granted; the loss in wages, though, during the dispute, was approximately \$1,330,000. Those on strike were chiefly members of the National Union Gas Workers, the Amalgamated Iron Workers, Brickmakers, General Laborers, and the Workers' Union.

ARCHAEOLOGICAL INSTITUTE OF AMERICA. The work of the Institute was carried on in its various departments during the year. The School at Athens continued its excavations at Corinth, and conducted a minor excavation in the vicinity of the Erechtheum on the Acropolis at Athens. The American School of Archaeology, continuing the work upon which it has been engaged for seven seasons at Guirigua, Guatemala, excavated the buildings on the north and east sides of the Temple Court. It further conducted explorations in the Peten district of Guatemala and made a survey of the ruins at Guarai in New Mexico. Plans for new excavations under the auspices of the institute on the shores of the eastern Mediterranean were necessarily postponed on account of war conditions now prevailing in the two regions of greatest archaeological interest. In the field of publication the most significant event of the year was the final launching of the new nontechnical magazine *Art and Archaeology*. David M. Robinson was appointed general editor, W. H. Holmes, art editor, R. V. D. Magoffin, associate editor, and Mitchell Carroll, General Secretary of the Institute, managing editor. The first number appeared on July 1, 1914. The officers of the institute in 1914 were F. W. Shipley, president; Mitchell Carroll, general secretary; Willard V. King, treasurer. The schools maintained by the institute are the American School at Athens, American School of Oriental Research in Jerusalem, and the School of American Archaeology in Santa Fé, N. Mex. The membership is about 3500.

ARCHAEOLOGY. MESOPOTAMIA. At Assur, in Babylonia, the German Oriental Society has been engaged for a year. The most important results from the campaign have been the discovery of five well-preserved tombs belonging to Assyrian kings, and the finding of a very old temple of Astarte for which the claim is made that it dates from the fifth millennium B.C. The temple contained, besides a number of pictures, other works which are likely to prove of great use in changing the present knowledge of ancient history in this part of the world. In the temple were found all the usual signs of the oldest Sumerian culture, although evidence is not at hand as yet to guarantee that it was the Sumerian people who worshiped here, in this oldest Assyrian temple yet discovered, in the year 3000 before our era. The five royal sarcophagi were nearly as interesting a discovery as that of the temple just mentioned. They were found in the southern wing of the palace and are the first monuments of this character to come to light. Although in Parthian times

these sarcophagi were rifled and injured it has nevertheless been possible to restore them. Three have been identified as having belonged to King Asur-Belkala (who dates about 1100 B.C.), King Samsiudad (about 820 B.C.), and the well-known King Asur-Nazir-pal III (who reigned about 860 B.C.). The tomb of the latter is the finest as well as the largest, measuring 6 feet in breadth by $5\frac{1}{2}$ in depth.

EGYPT. Egypt has afforded richer results this year than the other fields of activity. At Abydos the excavators were lucky enough to discover, behind the western wall of the temple built by Seti, what in all probability is the so-called Strabo's well—or the mystic tomb of Osiris. The building is entirely underground, for it was over 30 feet below the level of the temple, and consists in a general way of a rectangular structure which measures on the inside about 100 feet in length and 60 in breadth. The longer axis of the building runs north and south. On the western side is a great doorway 15 feet in width which came to light in 1912. The walls of the tomb are of the impressive thickness of 20 feet, and built of huge blocks of stone which often are 15 feet in length. The general arrangement of the interior is such that there are three aisles running from west to east, the central one being much the widest. These aisles are separated by huge monolithic piers about $8\frac{1}{2}$ feet square and 15 feet high. Of these piers there are five on each side of the central aisle. They support an enormous architrave 6 feet in height which in turn carries the unusually heavy ceiling. The latter is made up of great monoliths of granite over 6 feet in thickness. The two side aisles, which are about 10 feet wide, are connected at each end by cross aisles which form a ring around the central aisle and which, by being of a much lower level than the latter and filled with water, make a sort of island of this main central aisle. Although the present excavations have gone only to the depth of 12 feet it is believed that the enclosing canal went to the depth of about 25 feet. The water which filled it was due to infiltration from the Nile. On to these side aisles open six cells in front of which ran a narrow ledge. At the eastern end of this curious hall, and across the canal, is a long room which is the mystic tomb of Osiris. While this portion of the building is later than the rest, and dates probably from the time of Seti I, the main part is much older, and from its style of construction, which resembles that of the temple of the Sphinx, dates probably in the fourth dynasty. It is therefore one of the oldest monuments in Egypt.

At Antaeopolis the Germans carried on a campaign which lasted from the end of September, 1913, until the close of March of this year. The work was confined to the cemeteries of the city and it was found that the oldest burials go back to the first dynasties. Besides the ordinary interments the excavators found rock-cut tombs belonging in time to the old kingdom. In the chief necropolis, which is located in the hill of Gâu, rock-hewn tombs of princes of the middle kingdom were opened. Those of Wahka I, Wahka II and Ibu are much larger and of greater magnificence than any private tombs of this period previously known. Their arrangement is such that a broad approach leads up from the plain to a terrace upon which

appears a hypostyle hall. Beyond this lies an upper platform, also carrying hypostyle halls, to which access is given by a rock-cut ramp and bridge. There a gate gives entrance into the rock-cut burial tomb which resembles those at Beni-Hassan.

From Antinoe the English have recovered, in addition to fragments of papyri with lines from the Iliad, the Odyssey and the Phœnissæ of Euripides, about 10 pages from the Idyls of Theocritus. The pages contain about 50 lines, so that about 600 lines in all have been obtained. The work dates from the fifth or the sixth century and therefore antedates the earliest of the mediæval manuscripts now in existence. Except for a small fragment found at Oxyrhynchus, and some fragments of vellum in Berlin, Paris, and Vienna, this is the only Theocritean manuscript which has yet been found in Egypt.

Eleven weeks' work by the Byzantine Research and Publication Fund at Der El-Ganadla ended on January 28 with the result that many buildings of Coptic times were cleared. In these the most important discoveries were some frescoes in a villa which included a picture of the Three Holy Children in the fire, Saints Cosmas and Damian, and an exceptionally well painted peacock. At Gizeh the Vienna Imperial Academy of Science had been working for three years on the middle area of the cemetery connected with the pyramids of Cheops and Chephreu. In April of this year work on the eastern portion of the concession had been completed. The results of the excavations are of prime importance in adding to our knowledge of the *mastaba*. Not only was a somewhat more developed type for the archaic period seen in a few instances, but much new evidence has been discovered for the type with corridor and special *serdâb*-building. This is of particular importance since one example has been dated in the time of Dedkers' Asasis (Isesi, Aesasa, or Assa). This year, moreover, has resulted in the first discovery, on this site, of mastabas belonging to the time of the sixth dynasty. To be sure the loss of the upper parts of these buildings precludes the restoration of the exterior; but the arrangement of the interior can be made out in its essentials. The most important fact noted is the change of position of the grave shaft. In earlier times the practice had been to have it descend vertically from the mass of the mastaba. At this time it was discovered that a steep corridor, starting outside the building proper, descended to the burial chamber. This passage was closed by stones more or less shaped to fit their location. About this time also it became customary to decorate the chamber of the dead which previously had received no ornament. Two burials presented the peculiarity of having the body encased in a coating of plaster. This was applied over the linen wrappings of the body and modeled to imitate the form.

Near Lahun the British School has been engaged in clearing the whole area surrounding the pyramid of Senusert II. During the course of the work certain new features of construction were observed. Around the pyramid was a large trench with sloping sides which was filled with clean sand covered over with a thick stratum of pebbles. It is supposed that this feature was for the purpose of absorbing whatever moisture might accumulate from the rain-

fall. This trench was enclosed by a stone wall. Outside this wall were found the tombs of the royal family. The whole group of the royal tombs was enclosed by a brick wall 16 feet in thickness and around this, except on the northern side, a row of trees so arranged that 42 occurred on a side. Under the pyramid sand-bed a child's skeleton was found in a sealed box with offering dishes nearby. This seems to have been the human sacrifice made at the time of building the pyramid. In one of the five tombs located along the southern side of the pyramid it was found that a wide pit descended, by means of rock-hewn steps, to about 28 feet in depth. The tomb, like all the others, had been broken into and rifled, but curiously the robbers had overlooked a recess in which was found a golden crown. This consisted of a broad band of beautifully burnished metal decorated with 15 beautiful, inlaid rosettes and a royal cobra in front, itself inlaid and furnished with eyes of lapis lazuli. At the back of the crown rise two golden plumes, while three double streamers hang from the sides. Besides this crown were found golden collars of cowries and lions' heads, as well as two beautiful pectorals of gold inlaid with small pieces of carnelian, turquoise, and lapis lazuli.

At Meroe this year's work has seen a complete uncovering of the northwestern part of the site, and the connecting of the various sections. As a result the whole northern portion of the site is exposed, leaving only the southern part to be cleared. It has been found that the main entrance to the town was in the northern wall and that it led through an avenue of trees toward the centre of the city. There on the left side appears to have been a public building of some sort. Almost opposite this structure was uncovered what perhaps may have been an observatory, together with the house of an astronomer. The palace was situated to the left of the main gateway. It consisted of a large building containing a central courtyard and veranda. Opposite the palace was discovered a walled enclosure which was used for the cremation of the dead. The chimneys and flues were found in place and the floor was deeply covered with partially burned bones. Dating from the second century B.C. was discovered a place with its equipment used for astronomical purposes. On a wall were found a number of *graffiti* which showed the results of observations. Besides this were found rude sketches of two instruments which seem to resemble a transit and an azimuth instrument. Near the top of a flight of steps which led down to a pool and baths were found two stones used in taking observations. On one of these stones were marks pointing to corresponding symbols on the other.

From near Meroe also Sayce and Garstang have recovered the best, and longest Meroetic inscription yet found. Hopes are entertained that it may afford means for the complete decipherment of Meroetic writing.

From excavations at Kerma in Nubia traces of a garrison of the twelfth dynasty have been found, together with pan-grave burials of the folk who invaded this country in the Hyksos period. From fragments of alabaster which bear the names of Neferkara and Pepi I, it is proved that this site was occupied as early as the time of the sixth dynasty. The evidences for the later intrusions of the Hyksos period are

afforded by remains found in some ruined chambers. These were filled with ashes and cinders indicating a fierce fire. In this debris were many seal impressions of the Hyksos period. The graves of the invaders of the Hyksos period gave the best results of the whole excavation. The burials were distinctly barbaric. The chief personage was laid in the centre of a large pit, upon a carved bed, on his right side with his head toward the east and supported by a wooden pillow. Between his knees were placed a sword and dagger, while an ostrich-feather fan and sandals were located at his feet. At his feet also was buried a ram, often with the tips of the horns protected by ivory knobs. Around the bed lay the bodies of men and women in contracted positions with their heads to the east. Among them were placed pots, pans, jars, stools, etc. Over the whole burial was placed a great oxhide. Since all the bodies were interred at the same time we have proof here of human sacrifice on the occasion of the death of notable persons.

One of the most interesting discoveries made at Oxyrhynchus was that of a hitherto unknown work by the Poetess Sappho. It consists of two rolls of papyrus and it was found together with two rolls of her compatriot and contemporary Alcæus. One fragment gives the title of one of Sappho's manuscripts as "Book I, of the odes; 1320 lines." But unfortunately only 40 lines are complete. Excavations by Messrs. Whittemore and Wainwright at Sawāna have resulted in the discovery of burials belonging to the eighteenth dynasty. Many contemporary objects, including many scarabs, were found.

At Tarkhan, about two hours by rail from Cairo, a pre-dynastic burial ground has been discovered. Some 1500 graves have been opened which date just before or after the beginning of the first dynasty. Fortunately in some instances the upper part of the grave was completely preserved. Over the common burials was a mound plastered with a mixture of gypsum and sand to form a low dome. The larger graves were covered by mastabas. In these latter burials a flat pile of sand supported by a retaining wall 18 inches high covered the grave. The skeleton was usually found to be in a contracted position, with an alabaster bowl, which was covered with a stone palette, and a knife between the knees and the face. The tombs of the nobles were over 100 feet in length and surrounded by a thick wall of brick. These tombs originally date from the middle of the first dynasty, but were opened and re-used in the time of the twelfth dynasty. Around these same tombs were found some burials of the household still in a perfect state of preservation. One tomb, curiously enough, contained the skeletons of three beheaded donkeys. It was found that during the first dynasty green-glazed vases were in common use; that women usually and men occasionally wore necklaces. Indications were plentiful that these people were far from being barbarians. Their houses were of the same type, though in wood, as those already known and built of stone or brick. About the beginning of the dynastic period, to judge by the skeletons discovered, a race of smaller stature invaded this region after having dribbled in for many years before this time. So far as can be made out Tarkhan was a temporary capital, which was abandoned gradually

after the foundation of the city of Memphis by Mena, a couple of generations later.

From a cemetery dating from the twelfth and the eighteenth dynasties, and lying somewhat to the south of Tarkhan, Flinders-Petrie has recovered some fine jewelry and canopic jars.

SYRIA AND PALESTINE. The work which has been done at the site of Hittite Carchemish, on the Euphrates, shows that it was a fortified city of great importance. It consists of a strong enclosure which surrounds the palaces and related buildings together with a citadel. Besides this there is an area, which was unfortified, and was occupied by the common people. Attention is being paid now to the enclosed area, with the result that it has been found that the encircling wall, which embraced about one-half a square mile on the bank of the river, has been swept away to make space for the construction of a later town. The great mound, however, upon which the wall rested, still stands, rising to a height of 50 feet from the moat. Three gates here remain. At this point Hittite buildings which consist of flanking towers and lion-guarded gates, one within the other, have been found. These gates are separated by open courts so that the enemy after breaking through each gate would find itself exposed to attack on all sides. From the excavations at one of these gates was recovered an excellent head of either a god or a king of the latest Hittite times—the seventh century. Inside the walls were found a large area covered with the foundations of palaces. These together with a water-gate on the river bank have been partially cleared. The gate was flanked by great lions cut from dolerite and decorated with hieroglyphs in the Hittite tongue. One relief has been recovered showing children playing with knuckle-bones and whip-tops. The sculptures here betray much more grace than one usually expects to find in Hittite work. Besides this find a fragmentary figure of a huge Moloch was recovered. The god is represented as seated on a throne supported by lions and an eagle-headed figure.

The acropolis unfortunately is less well preserved, owing to the fact that in Roman times a great temple was erected on the site, and because at the northern end King Sargon, who captured Carchemish in 717 B.C., had built there a residence for his officers.

In the neighborhood of Jerablus have been discovered a large number of graves containing pottery, tools, and seals of Hittite style which date from about 2000 to 400 B.C. Because of the preservation of the strata on the site of the town itself it has been possible to follow fairly closely the development of culture in this place from Neolithic times to the close of the Bronze Age. Thus Hittite sculpture can be studied from its rise to its disappearance. About 100 new texts have also been found.

At Jerusalem excavations have disclosed the foundations of the circular Tower of Siloam. The same site has afforded a long inscription done in well-cut Greek letters which mentions the presbyters and fathers who with Simonides laid the foundations of the synagogue, the baths, and the inn. The foundations of the first two buildings have been laid bare. In connection with these a conduit was found which led from the spring.

ASIA MINOR. During his work at Antioch

Ramsey has discovered the location of the forum. Although but little excavation has yet been done on the site enough has been completed to show that it remains very much in the condition in which it was when St. Paul walked through the place. Evidence exists to show that it was put into its final and complete form about 14–18 A.D. A very long inscription, which is in fact a kind of review of the chief events in the life of the Emperor Augustus, was found to be cut on the balustrade of the monumental staircase, which ascends from the lower town to the forum above. A large church, in all probability that of St. Paul, was located at lower end of the street which affords approach to this staircase just mentioned.

Excavations carried on this year on the site of Aphrodisias have brought to light the ruins of a splendid bath. The building dates from the time of the Emperor Hadrian and is in such an excellent state of preservation that it is possible to identify its various parts. The part known as the *Calidarium* is remarkably well preserved. Particularly interesting are the inscriptions which have been found on the walls. One of them is distinctly modern in its tone. It runs, "The establishment will not be responsible for the loss of money or jewels unless they are left in charge of the porter."

The work of the Americans at Sardis has continued with profit. This year the sacred precinct around the Temple of Artemis has been extensively examined. On the south of this area, important discoveries were those of an early terrace wall of unhewn rocks and a layer of pottery, which assisted in the determination of the original slope of the ancient levels on that quarter. A long Lydian inscription was found during this work. Examinations carried on within the Temple of Artemis revealed the foundations of an earlier temple built of sandstone. As a result of sinking a trench in the bed of the ravine above the temple the excavators were able to make out even and well-defined stratification which allowed them to get their first sure chronological sequence for previously discovered objects. In the same neighborhood not over 20 feet from the surface of the ground were found Lydian remains of the sixth and seventh centuries, and below these a well-defined stratum of pottery bearing a likeness to the early Ionic fabrics. Below these again occurred fragments of geometric wares of black and gray clays. One of the most interesting finds in connection with the trench mentioned already was that of a very beautifully executed horse's head, and a foot with a gilded sandal. From the tombs many objects were recovered. Especially notable were a gold necklace of the modern "dog-collar" type, and three small lions which seem to have been carved from gold nuggets.

GREECE. From early April to late June the German Archaeological Institute has been at work excavating in the neighborhood of the Dipylon Gate at Athens. The digging was carried on over a territory which extends between the wall of the city and the modern Piræus Street, along the right bank of the river Erechon. One hundred and twenty meters from the city wall was found a boundary stone inscribed on front and back ΟΡΟΣ ΚΕΡΑΜΕΙΚΟΤ. This stone, which had nothing to do with

the Inner or Outer Ceramicus, marked the edge of the street leading from the gate, and determined the direction of the famous burial street which, after six *stades*, ended at the Academy. One of the results of the excavations was to show that this street had the imposing breadth of 38 meters. Digging near the city wall, which brought to light a private burial place, disclosed also evidences of Sulla's siege of Athens in the form of burned tiles, and fragments of wall paintings. The floors here found were executed in *terrazzo* and all the details pointed to a house belonging to the Hellenistic Age. The excavators found as well traces of an imposing burial place which was about 15 meters broad and about 8 meters deep. The front half was given up to a richly developed facade with wings and a circular structure, about seven meters in diameter, in between.

ITALY. Various places in this country have come in for attention on the part of the archaeologist. At Corropoli a neolithic cemetery has been examined and some 40 tombs have been opened. The practice of entombment was not burial but that of laying out the dead in circular or elliptical huts. On the island of Gozzo government employees, while digging at Pergla, came across an interesting tomb of the Neolithic period. It was contemporary with the *hypogeum* of Hal Safieni discovered at Voletta a few years ago.

More extensive is the work which has been done on the site of Ostia, where excavations have been carried on for several years. This year's campaign has been occupied with the area lying between the theatre and the temple of Vulcan. Work here disclosed the fact that the *Decumano Republicanum*, one of the main streets of the town, lay exactly two feet below the level of street of Imperial Rome, which was uncovered two years ago. It probably dates from the second century before our era. This street was paved with blocks of tufa cut with deep furrows on either side for the reception of the wheels of vehicles. The shops which opened on to the street consist of four rooms about 13 feet square. Rude mural drawings found in them date them from the time of the Gracchi. Possibly the most interesting discovery made at Ostia this year was in the street which led up to the temple of Vulcan—running parallel to the *Decumano*. This street is nearly 16½ feet in width. Located on it are several houses so preserved that the second storeys are standing. From these it becomes clear that the Romans of Republican times at Ostia had developed the plan of dwelling in flats. From Martial of course we know that this mode of life was common enough in Rome in his days. Here at Ostia the entrances to these houses are three feet above the level of the street, so that access to them had to be afforded by flights of steps. Five similar entrances have been found in one house or block. On each story there were three apartments, with a balcony built out over the street and constructed as to join with the others to form a continuous outdoor corridor.

As a result of sinking a shaft on the highest point of the Palatine Hill in Rome, Boni believes that he has located the *Mundus*, that is, the seat of Dis and Proserpine. This monument, which was lost even to the Romans themselves in the time of the early empire, consists of a domed building constructed of blocks of

tufa. Boni's belief rests upon discovery of a stone cover resting upon the chamber, which he believes to be the *lapis manalis*, which was supposed to close the entrance to the infernal regions, through which the souls of the dead might rise. This lid was removed three times each year. In addition to this discovery, the location of a shaft which descends from the Chamber to passages lined with cement to render them suitable for the storage of grain (?) seems to confirm the identification of the site. It will be remembered that the *Mundus* was a storehouse for the sacred grain.

Further excavations on the Janiculum, instituted with the intention of ascertaining the exact location of the Sacred Grove and Spring of the Nymph Furrina, disclosed traces of the walls and pavement of a temple which was dedicated to the Syriac gods. Inscriptions recovered from the site show that the temple was built or redecorated by a police official, named Gaionas, during the time of Nero. In or near what apparently was the sanctuary of the temple were found a fragment of a fine candelabrum, which was decorated with figures of nymphs and dancing Hours, and a complete statue of Dionysus executed in Parian marble. A more interesting find was that of a bronze figure about three feet tall clothed in a kind of mantle which, permitting the form to be visible, ended in two points at the level of the ears. This was found in the centre of the seven-sided cell and is thought to represent Hadad or some divinity akin to the Mithraic Kronos. The idol, like many another Syriac deity, was wrapped about by the folds of a serpent, and between each coil were found remains of an eggshell, which seems to show that some rite of consecration had been performed here. Also on the Janiculum was discovered some fragments from a figure of Zeus.

In Rome has been found the house of Pollio, the friend of the poet Virgil. The ruins, which contained many works of art, give plenty of indications that the building was magnificent. In the atrium was discovered a pavement executed in black and white marble, showing a nymph riding upon a Triton. Traces of a fountain were found on one of the walls.

In Tarentum has been found a large Greek tomb built in the form of a house of the sixth century B.C. In it was a carefully paved floor and four Doric columns which supported the roof. In the tomb were three sarcophagi. At Val Vibrata a burial ground of the Stone Age has been located. It consists of small huts of such size as to contain anywhere from two to eight bodies. On either side were low platforms, which sloped toward the centre of the building, upon which were placed the dead, so arranged that they lay on one side with the knees drawn up in a cramped position. One of the huts contained no bodies; instead within it was found a large circular hearth together with pieces of broken vessels, and the bones of animals. Here are believed to have been held the funeral banquets in connection with the burial of the dead. The various objects found here in these huts increase one's respect for the degree of civilization attained by the Neolithic Age.

NORTHERN EUROPE. Near Lyons in France, the ruins of a large house of the Roman period was found and uncovered. Its mosaic floors were uncovered and coins of the age reaching

from Augustus to Gratian were recovered. Many potsherds of Gallo-Roman style came to light. At Sogny, also in France, a large Gallic cemetery was examined and 270 tombs, of which 38 were intact, were opened. In 14 of these was found a warrior's chariot. Besides these the burials contained a number of spears, swords, javelins, daggers, knives, pottery, and some jewelry mounted on iron and bronze.

At Caversham in England a pit dwelling was discovered in a quarry. It was furnished with a perpendicular passage which led to a large circular room several feet in diameter. The whole structure was found to be full of black earth and charcoal in which were remains of the Bronze Age. See PEABODY MUSEUM.

ARCHITECTURE. The world's work in architecture for the year 1914 was overshadowed by the gigantic cloud of international enmity, which resulted in a number of conditions inimical to building progress. Available funds in public treasuries were diverted toward national defense, while the purse strings of private pocket-books were pulled tight. In Europe there occurred also the concomitant deficiency of labor and materials. In general the annual output, though smaller by scores of buildings in the countries at war, was but slightly reduced in America. It is not possible in the succeeding paragraphs to make an accurate compilation or record of new structures, but a general survey is presented affording a basis for a fair estimate of the architectural production of 1914.

UNITED STATES

In the United States the year 1914 was one of contrasts. There were more unemployed draftsmen than ever before; office staffs of architects were reduced to the minimum of necessity. On the other hand, there were under contract at one time during the year churches alone to the value of \$42,000,000 and one-seventh of this amount was represented by ecclesiastical structures in process of erection in New York City. Again, although there had been a decided decrease in the number of theatres, public monuments and the smaller private residences, due to money stringency, this was well balanced by the wholesome increase in the number of hotels, schools, and especially of churches and hospitals. Other types of buildings apparently followed their normal factor of increase, showing a regular quantitative result and an encouraging qualitative improvement. Stylistically the much praised and equally decried eclecticism, so characteristic of the United States, was almost imperceptibly crystallizing, developing modes of expression less and less alien to the soil, more and more American. The process was manifested by the usual stages, for instance, the slow modification of practically set local types in New England; the free and breezy interpretation of the Pacific Coast; the sturdy, often experimental, sallies of the Middle West; the pronounced cosmopolitan quality of each great metropolis. The whole gamut of the historical styles was repeatedly struck, often advantageously adapted, and all too often maltreated in the "Americanization"; but the whole effect was salutary, it makes for an ultimate unity in the establishment of which—under the existing conditions—a single twelvemonth can play but a small and humble part.

New York, Chicago, Minneapolis, and San Francisco contributed the largest number of buildings. Cleveland and Los Angeles were well represented, while Boston and Philadelphia and the large cities of the South produced no important work. No great structure that dominated the whole field could be pointed out as did the New York Courthouse design in 1913, but this deficiency was redeemed by the splendid groups under way at the Panama-Pacific International Exposition grounds, and, furthermore, by the greater number of smaller buildings of good design which were erected at many points throughout the country.

Concrete continued in favor as a building material, and found many applications in farm buildings. Terra cotta was more and more generally used, and the weight and height of new buildings, especially in New York, led to further experiments in fireproofing, windbracing, and foundations.

CHURCHES. The ecclesiastic work of the year was dominated by the splendid mediævalism of the firm of Cram, Goodhue & Ferguson; this served as an enlivening virus for the degraded Gothic of the end of the last century and infused an invigorating force into a set of dry forms. St. Thomas's, in New York, was the best of the recent churches. Since its erection, Mr. Goodhue began practice independently and produced a fine Gothic structure, the Chapel of the Intercession for Trinity Parish, New York. St. Thomas's stands on the site of the old building by Upjohn which was burned in 1905. It has Guastavino tile vaults which are acoustically a thorough success. Experiments to this end were conducted under the direction of Professor Sabine of Harvard, who devoted much attention to the material composition of the tiles used, the degree of heat to which they were subjected in baking, and the direction of the joints between them. Another interesting Gothic structure is the Chapel of the Queen of All Saints, Brooklyn, by Riley & Steinback, the much reduced realization of an abandoned cathedral project. Other Gothic examples are the Church of the Holy Family at Latrobe, Pa., by John T. Comes, Emmanuel Presbyterian Church at Philadelphia, by C. W. Bolton & Son, Christ Church at Norfolk, Va., by Watson & Huckel, and the Broadway Presbyterian Church, New York, by L. E. Jallade. Several noteworthy examples in the Italian Romanesque or Lombard style, chiefly of brick, are the Webb Horton Memorial Church at Middletown, N. Y., by Carrère & Hastings, St. Mary's at McKeesport, Pa., by J. T. Comes, SS. Peter and Paul's at Rochester, N. Y., by Gordon & Madden, and St. Patrick's at Philadelphia, by LaFarge & Morris.

The Colonial and its parent, the English Renaissance, with its derivative Adam and Gibbs varieties, continued in favor in New England and the Middle States, witness the Fort Washington Presbyterian Church in New York, by Thomas Hastings, the Second Presbyterian Church at Boston, by Cram & Ferguson, the First Presbyterian Church at Lewiston, Pa., by C. W. Bolton & Sons, the Second Unitarian Church at Boston, by Cram, Goodhue & Ferguson, and All Souls-in-the-East at Summit, N. J., by Joy Wheeler Dow. Other indications of the versatility of the American designer were to be seen at St. James's at St. Joseph, Mo., by Eckel & Aldrich, the First Presbyterian Church,

by Wm. C. Hays, and St. Ignatius', by C. J. I. Devlin at San Francisco, the First Church of Christ Scientist at New Orleans, by Sam Stone, Jr., All Saints' at Masontown, Pa., by John T. Comes, in the Italian and other forms of the Renaissance, using terra cotta extensively; while in the Baptist Church at Churchland, Va., by Neff & Thompson, and in St. Paul's at Cedar Rapids, Iowa, by Louis H. Sullivan (later modified by Wm. C. Jones) it was interesting to note a new independent and nontraditional feeling, which was sponsored by these particular architects in a number of other enterprises.

SCHOOLS. The West, notably the Coast States, maintained its high rate of increase in school buildings. These were chiefly of brick and stucco, and the suggestion of the "Mission" parentage controls many of their designs. Classic forms in stucco and terra cotta likewise were found and the influence of the eastern Collegiate Gothic appears in three or four examples. It was also interesting to follow in the far western high and technical schools the growth of group planning. This was well illustrated in the work of Allison & Allison in their State Normal School and the Wilmington High School at Los Angeles, as well as in the High School group at Santa Monica, and in the work of Whitey & Davis in the Polytechnic High School at Santa Ana. The last was a group of four buildings, entirely of brick with plaster covered frame interior, the total cost not exceeding \$176,000. Good single structures were the High School at Santa Paula, by Allison & Allison, the Polytechnic High School of San Francisco, by that city's Board of Public Works, and the High School at Woodland, by W. H. Weeks. All of these were in California. To them should be added the High School at Newburg, Ore., by E. E. McClaran. The smaller common or primary school buildings were of varied type, though brick predominated as the general building material; e.g., the McKinley School at San Francisco, by Newton Thorpe; the Malabar School at Los Angeles, by Whitey & Davis; the Ainsworth School at Portland, Ore., by F. A. Naramore; the Central School at Tacoma, Wash., by Heath & Gove. In the Middle West, Garber & Woodward were the architects of the Guilford School and the Frederick Douglass School at Cincinnati, and Wm. B. Ittner of the Central High School at Minneapolis. Notable eastern examples are the pseudo-classic High School at Albany, N. Y., by Starrett & VanVleck, the Colonial brick Widener Memorial School at Longport, N. J., by Horace Trumbauer, the High School of like style at Southampton, N. Y., by Hewitt & Bottomley. The last named was a carefully studied structure, the winning design of 23 submitted. The Colonial style was prescribed because of the fine old town houses still standing at Southampton. The architects allotted 67 per cent of the available wall space to windows, this being 30 per cent more than the New York State Education Department requires. The Flemish Renaissance manner appeared in the Ridge School and the Jacobean in the Normal School, both at Newark and both by E. F. Guilbert.

UNIVERSITIES. The universities have come fully to appreciate the advisability of the prearranged plan for campus growth. Northwestern University at Evanston, Ill., joined the ranks of the larger institutions with such a gen-

eral plan of development, the design of Palmer, Hornbostel & Jones, and in 1914 erected new dormitories as part of this scheme. Plans likewise were adopted for a large group at Portland, Ore., for Reed College; the designs were by Doyle & Patterson. Ohio State University built a library, by Allen & Collins, of English Renaissance design; the University of Utah added a \$300,000 administration building by Cannon & Fetzer and Ramm Hansen. The most important work of the year in this field, however, was in the Americanized Collegiate Gothic manner, which had established itself at least a dozen large institutions. Inspired by the example of West Point, the Virginia Military Institute adopted a large general plan by Bertram G. Goodhue. Other Gothic university buildings were the Macky Auditorium at Colorado State University, by Gove & Walsh, the new building for Notre Dame Academy at Cleveland, by Wm. C. Jansen, and the Veterinary College for the University of Pennsylvania, by Cope & Stewardson.

HOSPITALS AND HOMES. The year witnessed a remarkable activity in hospital construction, especially in and near New York City. The general development of hospital planning followed faithfully the English policy of decentralization. This led to multiplication of units, long narrow wings and pavilions, and interminable connecting corridors. Many new hospitals were erected, a few for specific diseases, and several old foundations made noteworthy extensions. In New York State were completed the Colonial Samaritan Hospital, by G. B. Post & Sons at Troy, St. Anthony's, by I. E. Ditmars at Woodhaven, L. I., the Metropolitan Life Insurance Company's Sanatorium at Mt. McGregor, by D. E. Waid, and the following in Greater New York: Sea View Hospital, Staten Island, by R. F. Almira; Greenpoint Hospital, by F. J. Helmle, and new buildings and extensions for the German Hospital, by I. E. Ditmars, for the French Hospital, by Heidelberg & Levi; for the Hospital for Deformities and Joint Diseases, by G. Provot, for Bellevue Hospital, by McKim, Mead & White. In Pennsylvania were built two brick Colonial hospitals: the thoroughly decentralized Schuylkill County Hospital, by L. L. Stockton and H. C. Pelton at Schuylkill Haven and the Henry Phipps Institute for the Treatment of Tuberculosis by Grosvenor Atterbury at Philadelphia. Massachusetts' only contribution was the Children's Hospital at Boston, by Shepley, Rutan & Coolidge. At Baltimore was completed the Phipps Psychiatric Clinic for Johns Hopkins Hospital, by Atterbury, and at Waterloo, Iowa, St. Francis's Hospital, by V. J. Klutho.

With hospitals Homes readily may be classed, for they are often subject to similar demands in planning and purpose. The excellent conception of A. W. Brunner found form in the Montefiore Home in New York City. This had adequate provision for 500 patients suffering from chronic diseases. It consisted of nine buildings, all of brick, limestone, and terra cotta, and each a segregated unit connecting with a general corridor. The buildings and site are valued at \$2,000,000, and the annual operating cost is \$300,000. To provide for future comfort, the city fathers were prevailed upon to close a public street that disturbed the plan, and a restriction was formulated to prevent building within

60 feet on the four limiting streets. The John Dickson Home for Aged Men, by Arthur B. Heaton at Washington, D. C., is a good Colonial example and, in New York again, the Anthony Home (for working women) in the Georgian style, by Valentine & Kissam, should also be noted.

PUBLIC BUILDINGS. The quota of public edifices completed in 1914 was not large, and the usual preponderance of municipal architecture was noticeable. In the national capital a new post office was built, by Graham, Burnham & Co. and Oscar Wenderoth, while Tracy & Swartwout furnished the accepted design for the new Washington Memorial Hall, which was probably to be one of the structures of leading importance in 1915. Both Utah and Idaho completed State capitol buildings, the former by Richard K. Kletting, the latter a \$2,000,000 structure begun eight years earlier, by Tourtellotte & Hummel. At Hackensack, N. Y., and in the Bronx, N. Y., County Courthouses were erected, by J. R. Gordon and M. J. Gavin, the first being a miniature imitation of the stereotyped form of State capitol building, with pronounced wings and high dome. A new Courthouse by Wyatt & Nolting was built at Baltimore, and in New York the design of Alfred Hopkins was accepted for a tall building for the Courts of Inferior Jurisdiction. Of municipal buildings the finest of the year were those composing the \$1,000,000 group at Springfield, Mass., by H. W. Corbett and F. L. Pell. A large city hall of striking design and of thoroughly efficient plan was erected for Oakland, Cal., by Palmer, Hornbostel and Jones, while the same firm furnished, in conjunction with E. B. Lee, the accepted design for a municipal building in Pittsburgh, and with John D. Thompson, Jr., the accepted design for the extensive New Castle Co.-Wilmington Public Buildings at Wilmington, Del. Interesting small Colonial and Georgian town halls were built at Huntington, L. I., by Peabody, Wilson & Brown, and at Arlington, Mass., by R. Clipston Sturgis.

LIBRARIES AND MUSEUMS. But one museum was completed in 1914, the Minneapolis Institute of Arts, a stately classic structure by McKim, Mead & White, costing \$3,000,000. But few libraries were built, and of these only one of fair size, that at St. Paul, Minn., by Electus Litchfield. Other new structures were at Somerville, Mass., by Edward L. Tilton; at Cold Spring Harbor, L. I., by Peabody, Wilson & Brown; at Carmel, N. Y., the Reed Memorial Library, by Gayler & Pryor; at Exeter, N. H., the Davis Library for Phillips-Exeter Academy, by Cram, Goodhue & Ferguson. At Snohomish, Wash., a library by Bigger & Warner was an echo of the work of A. A. Cantin, a rebel in the architects' camp, who had promised the world a new style made out of whole cloth.

BANKS. The earning capacity of the office building as an asset in the banking business comes more and more to be relied upon by the builders of new structures in this field. At Los Angeles, the building of the First National Bank, by Morgan, Wells & Morgan, and in Chicago, the immense Continental and Commercial National Bank are cases in point. The most important special structure for banking purposes was the severe Morgan Banking House in New York, by Trowbridge & Livingston; while smaller structures in the classic manner were

the Citizens' Savings Bank at Stamford, Conn., by L. E. Jallade; the Jefferson Co. Savings Bank at Birmingham, Ala., by Wm. C. Weston; and the small Savings Bank at Taunton, Mass., by Marcus T. Reynolds.

HOTELS. There is no better index of the unity of the United States than the steady increase of the number of hotels, especially of those of medium size. The year was inaugurated by the opening of the excellent Biltmore, the fourth great hotel in New York City, by Warren & Wetmore. This forms part of the large plan of the terminal accommodations of the New York Central Railroad. It is 26 stories high and contains 1000 rooms with 950 baths, not to mention the usual dining, banquet, and ballroom provisions. The building stands above the level of the incoming trains platform of the terminal station, and therefore the kitchens and various mechanical devices are provided for in stories above the street, with consequently greater sanitation and convenience; while for the same reason the ventilation plant is placed on the fifth floor. Both power and heat are derived from the central power plant of the whole group several city blocks distant. Likewise of considerable size were the Hotel Statler in Cleveland, by Geo. B. Post & Sons; the Hotel Oakland, at Oakland, Cal., by Bliss & Faville; and the Tutwiler Hotel at Birmingham, Ala., by W. L. Stoddard & W. L. Walton, while the following with less than 500 rooms also deserve mention: at Omaha, Neb., the Gothic Hotel Fontenelle, by T. R. Kimball; at Cooperstown, N. Y., the Hotel O-Te-Sa-Ga, by Percy Griffin; at Chicago the brick and timber Stockyards Inn, by R. S. Lindstrom; at Worcester, Mass., the Bancroft, costing \$900,000, and at Philadelphia the Vendig, costing \$600,000, both by Esenwein & Johnson; and at San Francisco the Clift Hotel, by G. A. Applegarth.

STORES. In general the large hotel and the monster department store become amenable to many of the conditions and restrictions that characterize the skyscraper. This was seen to advantage in the Lord & Taylor Store, New York, a 10-story building in the Italian Renaissance style, by Starrett & VanVleck, equipped with a number of novel devices for facilitating purchases and expediting deliveries. Notable features of this building are the arrangements for the comfort of the employees, the display windows, which may be lowered to the basement and replaced by others already dressed, and the consistent use of Italian travertine stone for the floors, ceiling, and piers of the whole of the main floor. The imposing Altman Store was extended to more than double its size by Trowbridge & Livingston, the architects of the original building, and a small new building was completed by H. O. Chapman for the A. A. Vantine Company. At Pittsburgh, the 13-story Kaufmann & Baer Store, by Starrett & Van Vleck, strongly resembles the Lord & Taylor building in New York by the same firm. Mention should also be made of the small Edison Shop on Fifth Av., New York, by Shape & Bready, entirely of terra cotta and colored tile. This was a radical attempt to devise a solution for the troublesome problem of the smaller store front. The garish scheme was carried through the whole of a four-story façade; it relies chiefly upon motives of Byzantine origin in its decoration, and presents a number of frankly anachronistic panels, as of

MINNEAPOLIS MUSEUM OF FINE ARTS

1840

Greeks enjoying the phonograph, likely soon to lose their novelty.

OFFICE BUILDINGS. In the office building is found the true American skyscraper, with its thousand and one advantages and its problem of design which is the architect's hope and despair. The height of these buildings has often and to little purpose engaged the attention of New York's Board of Aldermen, and a Heights of Buildings Commission at last reported certain suggested limitations and improvements that would, if adopted, ultimately reduce the sunless canyons of the lower city. Other cities, profiting by New York's quandary, inaugurated a more thorough control of these business levathans, before they attain to such overweening importance in municipal life. By far the largest office building of the year was the Equitable Building, New York, a 40-story Renaissance structure by E. R. Graham. This was ably seconded by the slightly smaller Adams Building, by F. H. Kimball; the Consolidated Gas Building, by H. J. Hardenbergh; and the Walker-Lispensard Building, by Eidlitz & McKenzie and Voorhees & Gmelin, all three in New York. The last named is the heart of the country's telephone system: it is the headquarters of the New York Telephone and Telegraph Company and the Western Union Telegraph Company. Smaller buildings in New York were: the Hill Building, by Goldwin, Starrett & VanVleck; the Educational Building, by C. A. Rich, devoted entirely to schoolhouse needs, from books to sash-windows; the Russell Sage Foundation Building, by Grosvenor Atterbury. The Franklin Building in Chicago, by G. C. Simmons; the Northwestern Mutual Life Insurance Company's building in Milwaukee, Wis., by Marshall & Fox; and the Railway Exchange Building at St. Louis, Mo., by Mauran, Russell & Crowell also deserve notice. San Francisco produced three large office buildings in the Standard Oil Building, by B. G. McDougall; the \$500,000 Call-Post Building, by Reid Bros.; and the Hobart Building, by Willis, Polk & Co., which was a giant structure, faced throughout with terra cotta and completed in every detail within a period of 11 months.

FACTORIES, WAREHOUSES, ETC. In connection with office structures should be considered loft and other buildings used in the lighter manufacturing industries, as distinguished from the factory itself. To this class belongs the National Cloak & Suit Company's building, by I. E. Ditmars, the only large loft building erected in New York, the decrease in the number of new structures of this type being due to a redistribution of the tenants in lower Fifth Av., which left vacant a number of large buildings formerly used by stores, publishers, etc., and then occupied chiefly by the cloak and suit trades. Three large bread and biscuit factories were built in 1914: at New York, the National Biscuit Company's building, by A. G. Zimmerman and the Loose-Wiles Building, by Wm. Higginson; in Chicago, the Schulze Baking Company's building, by John Ahlschlager. Other buildings of the factory type are the Paine Furniture Company's structure in Boston, by Densmore & LeClear; the Parlin & Orendorff Plow Company's warehouse, by Bertrand & Chamberlain, and the Ford Auto Company's building, by Kees & Colburn, both in Minneapolis.

CLUBS, ETC. The year's list of new clubs and association houses is unusually large; it in-

cludes no less than six new buildings for Christian Associations and similar organizations and an equal number for Masonic brotherhoods. The former are the Harriet Judson Y. W. C. A. in Brooklyn in the Colonial style, by Frank Freeman; the Yonkers Y. W. C. A. in the English Renaissance style, by Franklin B. & Arthur Ware; the Watertown, N. Y., Y. M. C. A., by Jackson & Rosencrans; the fine brick building of the Railroad Branch of the Y. M. C. A. at New York, by Warren & Wetmore, and other Y. M. C. A. houses at Louisville, Ky., by McDonald & Dodd, and at Denver, Colo., by Marean & Norton. To this number should be added the large brick building completed in New York for the Y. W. H. A. Masonic temples were erected at Memphis, Tenn., by Jones & Furbringer and at El Paso, Texas, by Trost & Trost; the Roseville Masonic Temple, a queer complex of Greek and Egyptian motives in a modern street façade of brick and terra cotta, was built at Newark, N. J., by Jordan Green. Northampton, Mass., built an Oddfellows Building, by K. S. Putnam. By far the best of the edifices of this type was the well-studied Masonic Temple at San Francisco, by Bliss & Faville. At Boston the Harvard Club was designed by Parker, Thomas & Rice; at New York the Women's University Club built a new home from designs by Nelson & VanWagenen. Other clubs of miscellaneous purpose were the following: the Collegiate St. Elmo Club at New Haven, Conn., by K. M. Murchison; the Manufacturers' Club at Philadelphia, by Simon & Bassett; the Capital City Club at Atlanta, Ga., by Donn Barber; the half-timber Country Club at St. Joseph, Mo., by W. Boschen; and the stucco Point Loma Golf Club at San Diego, Cal., by Walter S. Keller. The Germania Club and the Shriners' Temple, both at Jacksonville, Fla., and both by V. J. Klutho, are unfortunate transatlantic reflections of the prevailing German manner, in these cases misunderstood and warped to an alien purpose.

APARTMENTS. Large city centres produce apartment houses with an astounding regularity, and with a consequent vulgarity of design and inconvenience of appointments. Of these only a few in the crop of 1914 need be recorded, the best being in Chicago: Lochby Court, by Richard E. Schmidt and Garden & Martin; Lake Shore Apartments, by Marshall & Fox; and at Bronxville, N. Y., Gramatan Court, by Bates & How. Several good examples were erected in San Francisco by Sylvain Schnaittacher.

RESIDENCES. Domestic architecture is always an intimate product of the soil; the current work in this field in the United States amply illustrated the adherence to tradition in the Eastern States and showed an unbounded versatility in the Middle West. The largest and most sumptuous private residence in New York was undoubtedly the Frick house on the site of the old Lenox Library, by Thomas Hastings. Of interest in New York State were: the Kernochan residence, by Cross & Cross in New York City; the Malory residence, by Upjohn & Conable at Rye; "Haymount," by Arthur T. Renwick in Westchester Co.; the Hayward residence, by Bates & How at Lawrence Park West; the Lewisohn residence, by Coulter & Westhoff at Ardsley; the Betts residence, by John P. Benson at Troy; "Killenworth," by Trowbridge & Ackerman at Glen Cove; the Hastings residence, by Carrère & Hastings; "Pond Hollow Farm," by Peabody,

Wilson & Brown at Westbury; and the Garver residence, by Stephenson & Wheeler at Oyster Bay. In other eastern States the following are noteworthy: at Philadelphia, the mediæval Italian Willet residence and studio, by Duhring, Okie & Ziegler; at Plainfield, N. J., the Hyde residence, by Arthur Ware; at South Orange, N. J., the L'Hommedieu residence, by Dillon, McLellan & Beadel; at Summit, N. J., the Nicol residence, by W. A. Balch & L. S. Beardsley; at Nutley, N. J., the Norton residence of Colonial clapboards, by Armstrong & DeGeleke; at Manchester, Conn., the Cheney residence, by A. R. Ellis; at Greenwich, Conn., the Sargent residence, by T. E. Blake; at Dalton, Mass., the Crane residence, by Harding & Sever; at Phipps Beach, Mass., the Aborn residence, by Edward B. Stratton; at Auburndale, Mass., the brick and timber Fiske residence, by H. J. F. Ludeman & C. V. Snedeker, Jr.; at Great Barrington, Mass., the fine Elizabethan design by Feruccio Vitale; at Wilmington, Del., the Jackson residence, by Shape & Bready; and "Nemours," by Carrère & Hastings. In the Middle West the following should be noted: at Rock Island, Ill., the Denkman-Hauberg residence, by Spencer & Powers; at St. Paul, Minn., the Goodkind residences in the English cottage style, by A. H. Stem; at Grosse Point, Mich., the Alger residence, by Charles A. Platt; in St. Louis, Mo., the Hermann residence, by H. Shaw, and the Thompson, Wallace, and two Davis residences, by Cope & Stewardson. At St. Louis likewise was built Adolphus Busch's "Bauernhof," or service quarters, suggested by the German type of enclosed service court and inspired from the architecture of Rothenburg, by Klipstein & Rothmann. In the extreme West the predominance of stucco tile and Mission forms, together with patio plans, is to be expected, although other European derivatives are frequent. The following deserve mention: at Pasadena, Cal., the Merrifield residence, by Myron Hunt & Elmer Grey, and the Culbertson residence by Greene & Greene; at Los Angeles, Cal., the Freeman residence, by Arthur S. Heineman, and the Rives residence, by A. F. Rosenheim; at Hillsboro, Cal., the Crocker residence, by Willis Polk & Co.; at San Francisco, the Saroni residence, by McDonald & McDonald, and the Spreckels residence, by G. A. Applegarth. Other good examples of less pretentious domestic work were produced by Bates & How at Bronxville, N. Y.; by Wm. Adams at Great Neck, L. I.; by Aymar Embury II at Litchfield and New Canaan, Conn., and Garden City, L. I., and by Hentz & Reid at Macon, Ga.

MISCELLANEOUS BUILDINGS. But little was accomplished in 1914 in the way of railway stations and theatres. Of the former only three need be noted: at Norfolk, Va., the Union Station, by Stem & Fellheimer; at Minneapolis, the Great Northern Station, by Charles S. Frost; and at Jersey City, N. J., the terminal of the Central Railroad of New Jersey, more exactly an engineering work, by J. O. Osgood, Engr.

The steady growth of the moving picture industry has caused a falling off in the number of new theatres. Large moving picture houses have become an established feature of New York's theatre district; among these is the Strand Theatre, by T. W. Lamb. Many of the older theatres have also been diverted to the more profitable uses of the film, but this has not dampened the energy with which smaller cinema

theatres, too numerous to record here, have sprung up mushroom-like at all points. Of the larger playhouses the following should be mentioned: at Boston, the Wilbur Theatre, by C. H. Blackall; at El Paso, Texas, the El Paso Theatre, by Trost & Trost; at New York, the Bronx Opera House, by George Keister, and the Candler Theatre and office building, by T. W. Lamb. The very small intimate theatres, with seatings all of one price, continue to increase; the latest additions are the Punch and Judy Theatre, by Murphy & Dana, and the Bandbox Theatre, both in New York; and a children's playhouse, to be called the Toy Theatre, was projected for 1915.

A notable experiment in the direction of industrial group planning has been inaugurated at Cleveland, under the name of Nela Park, by the National Electric Company. The design, which is Georgian, is the work of Wallis & Goodwillie. Mention should also be made of the large Garden Pier at Atlantic City, N. J., by Simon & Bassett, and of the new \$1,000,000 Bush Terminal pier at Brooklyn, N. Y., by Wm. Higginson.

There has been no public monument in 1914 at all comparable with the Maine Memorial of the year preceding. Two small private funeral monuments should be noted: the Anderson Mausoleum at Greenwich, Conn., by Charles A. Rich, with the usual classic formalism, and the Gothic cross in memory of Mrs. Wm. Astor, in Trinity Churchyard, N. Y., by Thomas Nash.

Slight progress has been made in architecture in the colonial possessions of the United States; nothing is reported from the Philippines, and the demand for purely utilitarian work has crowded out all possible growth of representative public buildings in the Canal Zone. Studies for extensive civic improvements at Albany, N. Y., have been produced by A. W. Brunner and C. D. Lay, and a modicum of progress has been accomplished toward their realization. Similar improvements on a much smaller scale are planned for Upper Montclair, N. J., by Crow, Lewis & Wickenhoefer.

AMERICAN INSTITUTE OF ARCHITECTS. This body maintained fully its high standard of ideals, service, and efficiency, as was shown in exemplary fashion in the various reports submitted at its forty-eighth annual convention at Washington, D. C., upon town planning, fire prevention, conservation of natural resources, and historic monuments. The important matters of the universal adoption of the practice of State registration of architects as well as of a basic building law received much attention, as did also the Institute's project for the 3400-mile Lincoln Highway and its appropriate architectural treatment.

EUROPE

Building activity in Europe during 1914 may be said to have ended with the month of July; the declaration of hostilities put a sudden end to new projects, which were indefinitely postponed or abandoned. A few buildings of note were completed after August 1, but most of these were in Germany; France had only a few housing competitions to show after that date, and England produced so little that the architectural weeklies were compelled to publish extended series of buildings in past styles and of furniture.

ENGLAND. In England, the most noteworthy works completed were the Neo-classic British Museum Extension, by Dr. J. J. Burnet, who followed closely the original design of Sir Robert Smirke, and the new King's College Hospital, by Wm. A. Pite, both in London. The last named adheres to the policy of decentralization recommended by a committee of the House of Lords. The buildings all branch at right angles from a 900-foot connecting corridor; they have an ultimate capacity of 600 in-patients and 303 nurses, while the out-patient waiting room alone seats 500. Other interesting new works in the British capital were: a new building for University College, by Prof. F. M. Simpson; Lloyd's Bank, by Waller & Son; the church of St. Alban's at Golders Green, by Wills & Kaula; the Norwich Union Insurance Buildings, by Howell & Brooks; the National Amalgamated Approved Societies Offices, by Beresford Pite; the Empire and India Houses and Moorgate Hall, both office buildings, by Trehearne & Norman and Richardson & Gill, respectively. The Metropolitan Railway likewise built new general offices, designed by C. W. Clark; large new schools were built for Greenwich and Battersea by A. Mitchell and Wright & Chapman. Designs were accepted for the new Paddington Baths by H. Burgess and for the immense new central offices of the Metropolitan Water Board by H. A. Hall. The competition for the new St. Paul's Bridge was unsettled at the end of the year, the design then favored being that of G. W. Browne. Edinburgh has contributed four excellent structures: Usher Hall, by Stockdale Harrison & Sons and Howard H. Thomson; the extension of the Royal Scottish Museum, by W. T. Oldrieve; the Portobello Town Hall, by J. A. Williamson; and the Edinburgh Provincial Training College for Teachers, by A. K. Robertson. The first named building was the result of a competition in which 133 designs were submitted; it is of horseshoe plan, and seats 3000 auditors. Its cost was \$670,000, while the Museum extension involved an outlay of \$600,000. Notable also was the completion of the western towers of St. Mary's Cathedral, Edinburgh, begun by Sir George Gilbert Scott in 1873 and now finished by J. O. and C. O. Scott.

Elsewhere in Great Britain the year saw the erection of the following: at Liverpool, West Africa House, by Briggs, Wolstenholme & Thornely, and the Midland Adelphi Hotel, by R. F. Atkinson; at Bristol, the Workmen's Hostel, by Harold Crone, and extensions of the General Hospital, by Oatley & Lawrence; at Dublin, new offices for the Local Government Board and for the Departments of Agriculture and of Technical Instruction, by Sir Aston Webb and Sir T. M. Deane; at Manchester, new premises for the Coöperative Wholesale Society, by F. E. L. Harris; at Sheffield, the Mappin Hall and Applied Science Buildings of Sheffield University, by Gibbons, Flockton & Teather; at Hull, the Hospital for Tuberculosis, by J. H. Hirst, and the Francis Reckitt Institute, by F. M. Reckitt & G. M. Carvill; at Glasgow, the new McLellan Galleries, by A. B. McDonald; at Dundee, the \$250,000 Provincial Training College, by T. M. Capper; at Durham, the Durham Miners' Association building, by H. T. Gradon; at Cardiff, government offices for the Welsh Insurance Commission and Labor Exchange, by R. J. Allison; at Ipsom, St. Martin's church, by

Nicholson & Corlette; at Perth, a city hall, by H. E. Clifford & Lunan; at Bolton, the Miners' Hall, by Bradshaw, Gass & Hope; at Stockport, the Central Library, by the same firm; at Wolverhampton, the National Provincial Bank of England, by Bromley & Watkins; at Maidstone, new County Offices for Kent, by F. W. Ruck; at Cambridge, a new building for Downing College, by C. G. Hare; at Portsmouth, St. Cuthbert's church, by E. S. Hall. The fine King Edward VII Welsh National Memorial Sanatorium was completed by E. T. & E. S. Hall at Pontywall. At Bath and Exeter civic centres have been begun by J. Belcher & J. J. Joass and by Thomas H. Mawson & Sons respectively. The centre at Bath was to include a new spa, baths, hotel, and gardens; the whole scheme was prompted by the discovery that the local waters are highly charged with radium. Designs were also accepted for new baths at Hendon, by T. M. Wilson, for the Wesleyan Central Hall at Blackburn, by Bradshaw, Gass & Hope, and for a large public art gallery at Belfast, by J. C. Wynnes. Of interest in the field of domestic architecture were "Crow Clump" at Weybridge, Surrey, by Tubbs, Messer & Poulter, and "Dene Lodge" at Aldershot, by H. O. Creswell. The garden city and housing movements have temporarily abated. A large secondary school at Ilkeston, by G. Widows, designed after the manner of current work in Berlin, caused much adverse comment.

In Canada the direct influence of American architecture makes itself thoroughly felt, though the English prototypes are in many cases faithfully observed. New works of the year in the Dominion were: at Ottawa, Government Buildings, by C. F. A. Voysey; at Montreal, a new Art Gallery, by Edward & W. S. Maxwell; at Toronto, the General Hospital, by Darling & Pearson. Elsewhere in the British Empire should be noted the New Law Courts at Cape Town, South Africa, by W. Hawke & W. N. McKinlay, and the Cathedral of St. Paul at Namirembe, Uganda, which is entirely of local brick and tile and has a capacity of 10,000. Designs were accepted for the pseudo-Byzantine Cathedral of St. Francis Xavier, by John C. Hawes at Geraldton, Australia; for Government Buildings, by C. F. Stevens & T. S. Gregson at Baroda, India; and for the Royal Exchange Building, by the same architects at Calcutta. While but small advance was made toward the realization of the new capital, plans by Lutyens & Baker at Delhi, India, the Australian government on the other hand issued a competition programme for a Federal Parliament House, the first of the central group of buildings in the projected colonial capital of Canberra.

Of archæological interest was the refronting of Buckingham Palace in accordance with Sir Aston Webb's scheme for the Processional Way, and the projected completion of Sir William Chambers' Somerset House.

GERMANY. German work to the beginning of August produced the usual number of industrial and municipal buildings. Stylistically these maintain the current German type of *Moderne Kunst*, which is the result of an intense desire to produce a national artistic expression, but which had not yet found its æsthetic balance. Interesting examples of new public architecture were the city halls at Schöneberg, by Jürgensen & Bachmann; at Kassel, by Hummel & Rothe; at Hanover, by F.

E. Scholer & Paul Bonatz; at Wittenau, by Fritz Beyer, and at Lankwitz, by the Gebrüder Ratz; also the market hall at Stuttgart, by Martin Elsaesser, a municipal bath at Neukölln, by Heinrich Best, a municipal theatre at Bremerhaven, by Oscar Kaufmann, a national bank at Wilmersdorf, by Philipp Nitze, and an office building for the Royal Marine at Charlottenburg, by Reinhardt & Süssenguth, the last of more or less traditional design with an infusion of personality and racial expression.

Other notable structures are the fine Ducal Museum at Coburg, by Rudolph Zahn, a new public home or *Bürgerheim* at Munich, by Hans Grässel, a sanatorium at Lahr a. M., by F. Gablonsky, and the extensive Royal Joachimsthal-sches Gymnasium at Templin, by Bräuning. Of church buildings only a few were produced; among them the Kapelle at Flensburg, by Jürgensen & Bachmann, a large church and allied buildings at Schlachtensee, by G. Büttner, and a synagogue at Essen, by Edmund Körner. The most important warehouses and factories were the Tietz Stores at Cologne, by Wilhelm Kreis, and at Düsseldorf, by Joseph M. Olbrich; the business premises of Fischbein und Mendel, by Hans Bernouilli & L. Rinkel, and the Lohse Perfume and Soap Factory, by Paul Jatzow, both in Berlin proper.

The most important single undertaking of the year, which was set aside entirely after the beginning of the international conflict, was the project for a Royal Opera House, to be built in the Königsplatz facing Wallot's Reichstag building, Berlin. The accepted design was by Martin Dülfer. In the field of domestic architecture the following were especially successful: the Landhaus Meier-Gräfe at Zehlendorf, by W. Epstein; the Villa Bröcking at Düsseldorf, by Rudolph Zahn; the Herzfelde residence at Templin, by Lessing & Risse; the Rischmüller house at Hanover, by W. Törnau; the Landhaus Reimer and the Landhaus Auhagen, both in Dahlem and both by Heinz Lassen. The garden city and city planning movements were gaining force throughout Germany, and noteworthy experiments were completed at Zehlendorf by Paul Mebes, as well as at Hellerau and at Margaretenhöhe, near Essen, the latter for the employees of the Krupp works.

FRANCE. The report for the first seven months of the year from France was of small promise. Evidently financial stringency had made itself felt there some time before hostilities actually began. In Paris itself were built the Rothschild Hospital, by Bechmann, the Champs-Élysées Theatre, by A. & G. Perret, and premises for the Compagnie de Suez, by Nénot & Demierre, as well as a high school building by Jamme. In the Grenelle quarter several new public schools were erected by Louis Bonnier, and in the districts centring about the Rue Mercadet and the Rue de la Solidarité extensive revisions of the housing accommodations have been undertaken. The usual grist of apartment houses was much curtailed in Paris. The great Ecole des Beaux-Arts itself was converted into a military hospital and four-fifths of its students went to the front. From other parts of France were reported: a Chambre de Commerce at Chalon s. S., by Protheau & Catin; a Provincial Home for Aged Men at Villejuif, by J. Morize; a bank at Joigny, by M. Blot; a monument to the memory of Clémence Isaure at

Toulouse, by Laporte-Blairsy, and the Archives Départementales de la Meuse at Bar-le-Duc, by M. & E. Royer. Of private dwellings there were but few of note: at Cambrai, by Herscher; at Luxembourg, by Pierre Funck. In Corrèze the Château du Pin has been rebuilt on the foundations of the original structure, by Henri L. C. Geay.

OTHER COUNTRIES. In Italy architectural progress was much reduced, owing to severe conditions of credit and general finance succeeding the Tripolitan War and other more recent difficulties which left the nation saddled with heavy responsibilities. The usual archaeological work of restoration and excavation continued steadily and resulted in minor discoveries at Pompeii and Ostia. At Testaccio was undertaken an extensive general housing scheme which without doubt would have due effect upon the preparations for increases in population in the larger Italian cities. The frequency of earthquakes in certain districts had led to a deeper study of the problem of the so-called anti-seismic buildings. It was found that these disturbances avoided church apses at Vespri, Monreale, Palermo, and elsewhere in the danger zone. On the assumption that the circular plan was the saving grace in these cases, Giuseppe Torre has promulgated a series of circular "anti-seismic" buildings, such as banks, apartments, etc.

In Russia the only notable building was the new Cathedral at St. Petersburg, by S. S. Krichinsky, to commemorate the tercentenary of the Romanoffs; this is modeled after the manner of the seventeenth century churches at Rostoff, and has been erected at a cost of \$250,000.

In Greece the replanning of Athens has received considerable attention, although nothing tangible has yet been completed. The work of laying out the city anew has been entrusted to Prof. Thomas W. Mawson of Liverpool University.

NECROLOGY. The losses to the architectural profession for the year are the following: in the United States—David B. Farquharson and Albert Pissis of San Francisco; Thomas C. Kennedy of Baltimore; Chas. H. Rutan of Boston; in Germany—Gabriel von Seidl; in France—Honoré Daumet, Henri de Geymüller and Emile Vaudremer; and many others less well known.

ARC LAMPS. See ELECTRIC LIGHTING.

ARCTIC EXPLORATION. See POLAR RESEARCH, ARCTIC.

ARGENTINA. A federal republic of South America. The capital is Buenos Aires, coextensive with the Federal district.

AREA AND POPULATION. The republic consists of 14 provinces, 10 territories, and the Federal district. There are varying estimates of the area, even those published by the Argentine authorities differ. One estimate is 2,987,356 square kilometers (1,153,417 square miles); another, 2,952,551 square kilometers (1,139,980 square miles); while a recent planimetric calculation made at the University of La Plata gives 2,789,462 square kilometers (1,077,011 square miles). The census of 1895 returned 3,954,911 inhabitants, exclusive of Indians to the estimated number of 30,000 and others 60,000; so that the total population in that year is placed at 4,044,911. It is hardly to be expected that, in lieu of a census, recent estimates of population can be very accurate. An estimate for the end of 1912

was 8,700,000; so high a figure for that date is to be regarded doubtfully. A recent census of the 10 territories is reported to show 358,738 inhabitants, as compared with 103,369 returned in 1895.

Some of the Argentine cities, Buenos Aires in particular, are increasing rapidly. In 1895, the population of Buenos Aires was 663,854; in 1904, 945,094; in October, 1909, 1,231,688; in 1914, 1,560,163. The last figure was reported as the result of an enumeration of June 1; later advices stated that several wards were omitted and that corrected returns would show a population of about 1,700,000. Buenos Aires (that is, the Federal district) has an area of 18,584 hectares, or about 72 square miles. The largest cities after Buenos Aires, with estimated population at or about the end of 1912, are Rosario, 219,677; La Plata, 106,382; Córdoba, 100,000; Tucumán, 78,695; recent estimate for Bahía Blanca, 72,706.

The number of immigrants by sea in the period 1857-1912 is stated at 4,248,355; emigrants, 1,156,871; excess of immigrants over emigrants, 2,768,081. During that period, immigrant Italians numbered 2,133,508; Spaniards, 1,298,122; French, 206,912. Immigrants and emigrants in 1911 are reported at 225,772 and 107,632 respectively; in 1912, 323,403 and 120,260. Of the arrivals in 1912, Italians numbered 165,662; Spaniards, 80,583; Russians, 20,832; Syrians, etc., 19,792; Austro-Hungarians, 6545; French, 5180; Portuguese, 4959; Germans, 4337; Britons, 3134. The number of North Americans was only 499. Marriages reported in 1911 and 1912, 48,224 and 51,582 respectively; births, 262,817 and 272,071; deaths, 125,327 and 120,480.

EDUCATION. Of the population over six years of age, about 50 per cent is illiterate. Primary education is free, secular, and nominally compulsory between the ages of 6 and 14. In 1913, the reported number of primary schools was 7247 (5894 public, 1353 private), with 22,964 teachers and 746,725 pupils. For secondary education there are 30 national colleges, with 1050 teachers and 8788 students, and 38 private schools of the same grade, with 398 teachers and 3200 students. There are 67 normal schools and various institutions for technical, commercial, and other special instruction. Higher education is provided by national universities at Buenos Aires, Córdoba, and La Plata, and provincial universities at Santa Fé, Paraná, and Tucumán. The last, established under a decree of July 2, 1912, was opened in 1914. The universities have about 7500 students, of whom the majority are at the University of Buenos Aires. Though there is no State religion, the Roman Catholic Church receives government support.

PRODUCTION. The prosperity of Argentina is due to agriculture and stockraising; of these, agriculture in recent years has made the greater progress, continually forcing the grazing industry farther from the large centres of population. The development of the cultivated area is shown in thousands of hectares as follows:

	1896-97	1900-01	1905-06	1910-11	1912-13
Wheat	2,500	3,380	5,675	6,253	6,918
Linseed	360	607	1,023	1,504	1,733
Corn	1,400	1,255	2,717	3,215	3,830
Alfalfa	800	1,512	2,984	5,401	5,955
Other	510	557	682	3,994	4,551
Total	5,570	7,811	18,081	20,867	22,988

Important yields in 1912-13: wheat, 54,000,000 metric quintals; linseed, 11,300,000; corn, 50,000,000; oats, 16,820,000; raw sugar, 1,472,490. In 1913-14, the output of raw sugar was 2,761,400 quintals. Live stock (estimate of Dec. 31, 1911): cattle, 28,786,168; horses, 8,894,031; mules, 534,813; asses, 319,315; sheep, 67,383,952; goats, 4,301,955; swine, about 2,900,000. Various minerals occur, including petroleum; but there is little mining.

COMMERCE. Imports and exports of merchandise have been valued as follows, in thousands of pesos gold:

	1895	1900	1905	1910	1912	1913
Imports—						
95,096	118,485	205,154	351,771	384,853	421,858	
Exports—						
120,068	154,600	322,844	372,625	480,391	488,505	

In pesos gold, imports and exports of merchandise in 1912 amounted to 384,853,469 and 480,391,256 respectively; in 1913, 421,352,542 and 483,504,547; imports and exports of coin and bullion in 1912, 36,077,807 and 585,621; in 1913, 47,941,425 and 43,417,484. Principal classified imports in 1912 and 1913, in thousands of pesos gold: textiles and manufactures thereof, 78,370 and 89,560; iron and steel and manufactures thereof, 45,998 and 50,040; vehicles and railway equipment, 32,799 and 37,223; earthenware, glass, earthenware, stone, coal, etc., 33,617 and 36,578; building materials, 31,265 and 35,776; food products, 30,140 and 34,934; oil, grease, etc., 18,446 and 23,779; chemicals, drugs, etc., 14,281 and 15,194; metals (other than iron and steel) and manufactures thereof, 14,367 and 14,258; wines, liquors, and other beverages, 14,677 and 14,042; timber, woods, straw, and manufactures thereof, 9888 and 10,829; electrical apparatus, 9309 and 10,110; paper and manufactures thereof, 9867 and 9902; agricultural implements and machinery, 12,552 and 9125; tobacco, 7595 and 7038; hides, skins, and manufactures thereof, 3903 and 4611. Subdivisions of textile import in 1912 and 1913, in thousands of pesos: cotton, 38,138 and 41,407; wool, 14,374 and 16,752; silk, 6548 and 7080; other, 19,310 and 24,321. Iron and steel in 1912 and 1913: primary and relatively primary material, 22,343 and 24,149; manufactures, 23,655 and 25,891.

Classified exports of merchandise have been valued as follows, in thousands of pesos:

	1905	1910	1912	1913
Agricultural ..	170,285	196,582	278,187	301,267
Pastoral	141,043	161,007	188,216	165,800
Forest	7,125	10,565	8,983	10,618
Fish and game ..	791	1,429	2,608	1,817
Mineral	262	540	285	195
Miscellaneous ..	3,888	2,505	2,712	3,808
Total	322,844	372,626	480,391	488,505

Classified agricultural exports in 1912 and 1913, in thousands of pesos: primary products, 264,495 and 288,232; elaborated products, 7135 and 7468; by-products, 6556 and 5567;—classified pastoral exports: live animals, 10,965 and 8770; ordinary animal products, 155,028 and 136,336; elaborated animal products, 19,780 and 18,124; by-products, 2443 and 2569. The development of the leading exports is shown in the following table, in thousands of pesos:

	1905	1910	1912	1913
Corn	46,536	60,261	108,908	112,292
Wheat	85,883	72,202	97,835	102,631
Linseed	26,234	44,604	34,214	49,910

For orders	114,904	117,716
Total including other	384,853	421,358	480,391	483,505

The exports "for orders" are not recorded at the Argentine ports as for specific countries, but are subject to cable or other orders as to final destination. Nearly all of these shipments ultimately reach the western European countries, in about the same proportion as the direct shipments given in the foregoing table. Therefore such countries as the United States, Brazil, and Chile occupy, in respect of Argentine exports as shown in the table, a rank above that to which they are in reality entitled. The following figures show the percentage of imports and exports as shared by the more important countries:

	Imports			Exports		
	1910	1912	1913	1910	1912	1913
U. Kingdom	31.1	30.8	31.1	21.7	25.3	24.9
Germany	17.4	16.6	16.9	12.1	11.3	12.0
United States	18.8	15.4	14.7	6.6	6.7	4.7
France	9.6	9.8	9.0	10.1	7.5	7.8
Italy	9.0	8.5	8.3	2.8	4.4	4.1
Belgium	5.6	5.3	5.2	8.2	7.8	6.8
Brazil	2.6	2.5	2.2	4.7	4.7	5.0
For orders	27.8	23.9	24.4

Imports and exports of merchandise at the principal ports, in thousands of pesos:

	Imports		Exports	
	1912	1913	1912	1913
Buenos Aires	315,162	337,643	181,767	170,445
Rosario	32,468	37,111	85,119	90,575
Bahia Blanca	11,476	13,381	69,010	55,772
La Plata	9,251	10,005	32,491	43,065
Campana	3,033	6,524	7,331	7,645
Villa Constitución	2,920	4,344	1,642	1,464
Santa Fé	3,397	3,186	13,965	24,566
San Nicolás	67	19	20,820	25,228
Concordia	384	426	10,658	8,687
Zárate	1,184	2,385	11,105	7,778

SHIPPING. The total tonnage entered and cleared at Argentine ports increased from 25,241,618 in 1900 to 33,458,188 in 1905, 44,713,712 in 1910, and 50,343,674 in 1912. The following table shows the movement at the ports in 1912, distinguishing the over-sea shipping from the total, which includes coasting and fluvial:

	Over-sea		Total	
	Vessels	Tons	Vessels	Tons
Steamers:				
Entered ..	4,655	11,220,540	25,726	22,360,432
Cleared ...	4,739	11,542,881	34,946	22,449,511
Sail:				
Entered ..	255	310,218	37,081	2,726,468
Cleared ...	245	299,075	38,758	2,607,263
Steam and Sail:				
Entered ...	4,910	11,530,758	62,757	25,086,900
Cleared ...	4,984	11,841,956	73,699	25,056,774
Total ...	9,895	23,372,714	136,456	50,143,674
Buenos Aires	4,450	11,770,699	39,254	19,052,093

Of the total tonnage (50,143,674) in 1912, that of Argentina was 26,536,755; United Kingdom, 16,023,641; Germany, 2,609,220; Italy, 1,257,465; France, 979,084; Norway, 532,607; Austria-Hungary, 482,046; Netherlands, 400,064; Spain, 326,056. American shipping was only 28,348 tons.

The Argentine merchant marine in 1912 consisted of 446 steamers, of 120,882 tons net, and 1241 sail, of 96,896 tons net.

COMMUNICATIONS. The length of railway in 1912 was 32,853 kilometers (20,414 miles), the government railway amounting to over 5600 kilometers, and, of the total, nearly two-thirds was broad gauge. In extent of railway, Argentina holds first place among Latin-American countries.

During the year 1914 most of the railroads in Argentina suffered financially both on account of the European War and poor crops. The Central Argentine Railway, owned for the most part in England, decided to raise \$5,000,000 of new capital by the issue of 6 per cent three-year notes at par. The Buenos Aires Pacific, which paid 3 per cent dividends in 1913 passed its dividends in 1914. The Central Argentine and Buenos Aires Great Southern, and Buenos Aires Western reduced their dividends during the year, while the Argentine Railway was suffering considerable financial embarrassment, and it was reported that it might lose control of the Córdoba Central and the Entre Ríos. Nevertheless during the year the Argentine Railway ordered considerable additional rolling stock in England which would materially increase its equipment. During the financial year ended in 1914, 145 miles of extension were opened for traffic by the Buenos Aires Great Southern, bringing

its total completed lines up to 3727 miles. In 1913-14 the traffic receipts declined on account of the failure of crops, while floods caused damage to the track. A transportation bridge built for the road traffic between the capital and Avellaneda and the Sud Dock was brought into operation in June. The Argentina chamber of deputies sanctioned a bill granting a concession for a railway from Rosario to Rufino.

In 1912, the length of telegraph line was 69,603 kilometers and of wire 212,237 kilometers. Of the total, the national telegraphs amounted to 30,177 kilometers of line (78,181 kilometers of wire) and railway telegraphs to 28,775 kilometers (113,554 kilometers). Post offices in 1911, 3259.

FINANCE. The unit of value is the gold peso, worth about 96.5 cents. Under the conversion law of 1899, the paper peso is current with a value of 44 per cent of the gold peso, or about 42.5 cents. For 1913, the estimated revenue was 126,464,301 pesos paper and 94,964,481 pesos gold; estimated expenditure, 420,975,866 pesos paper. Of the revenue, customs receipts were estimated at 83,830,000 pesos gold. The larger estimated expenditures, in pesos paper, were: public debt, 83,936,194; justice and public instruction, 56,857,808; interior, 46,799,301; war, 29,840,716; marine, 26,083,313; finances, 22,030,140; agriculture, 15,517,877; extraordinary expenditure, 108,135,504. For 1914, the estimated revenue and expenditure were 423,073,000 and 424,101,000 pesos paper respectively. Customs revenue has been as follows, in pesos gold:

	1905	1910	1913
Import duties...	43,615,426	76,033,647	82,887,629
Export duties...	2,413,406	3,902	1,962
Other duties...	5,099,683	7,655,567	10,166,198
Total	51,128,515	83,693,116	93,055,789

At the end of 1912, the foreign debt stood at 297,993,975 pesos gold; internal debt, 159,751,700 pesos gold and 167,619,140 pesos paper; floating debt, 34,064,123 pesos paper; paper money in circulation, 786,399,171 pesos; total, 457,745,687 pesos gold and 988,082,434 pesos paper.

ARMY. Compulsory service in the army, which is a National Militia, is required from all citizens from their 20th to their 45th year, 10 years being spent in the "active" army or first line, 10 years in the National guard, and 5 years in the Territorial guard. The greater portion of the annual contingent serve only three months, and the remainder one year, the annual contingent of recruits being selected by lot on a territorial basis. Thus there is provided for the regular army a peace effective strength of about 24,000, with a reserve numbering some 174,000, while mobilized for war an effective strength of 2,600,000 should be forthcoming. The army is organized on a territorial basis, each of the five military districts providing a division of the first line and also a reserve division irrespective of the National guard or Territorial troops, the strength of each being about 12,000 men. The active army comprised 20 regiments of infantry, 9 regiments of cavalry, 7 regiments of field artillery, 1 horse artillery battery, 2 batteries of field howitzers, and 4 mountain batteries, 5 battalions of engineers, and a railway battalion.

NAVY. In 1914 the Argentine navy included two dreadnoughts, the *Rivadavia* and the *Moreno*, both launched in 1911, the former at the yard of the Fore River Ship and Engine Building Company, of Quincy, Mass., and the latter at the yard of the New York Shipbuilding Company, of Camden, N. J. Principal characteristics of the *Moreno*: designed speed, 22½ knots; displacement, 28,000 tons; length between perpendiculars, 575 feet; beam, 95½ feet; draft, 28 feet; main battery, 12 12-inch guns; secondary battery, 12 6-inch guns; torpedo tubes, 2; maximum thickness of armor belt, 12 inches; complement, 1050. Besides the two dreadnoughts (aggregating 56,000 tons), the navy included: 2 old coast guards (*Libertad*, 1890; *Independencia*, 1891), with a combined displacement of 4600 tons; 1 old coast guard (*Almirante Brown*, 1880), of 4200 tons; 4 armored cruisers (*Garibaldi*, 1896; *General San Martin*, 1897; *Pueyrredon*, 1898; *General Belgrano*, 1898), aggregating 27,400 tons; 3 protected cruisers (1890 to 1895), of 11,620 tons; 2 old torpedo cruisers (1890 and 1893), of 1776 tons; 2 armored river gunboats (*Rosario*, 1908; *Paraná*, 1908), of 2100 tons; 11 torpedo-boat destroyers, of 9000 tons; torpedo boats, transports, etc.

GOVERNMENT. Argentina is a federal republic, with a constitution vesting the executive power in a president and the legislative power in a congress of two houses, the Senate and the Chamber of Deputies. The president is elected for six years by indirect vote, and is ineligible for the next term; he is assisted by a responsible ministry of eight members. The Senate consists of 30 members elected indirectly for nine years, two from each of the fourteen provinces and the federal district. The Chamber is composed of 120 deputies elected for four years by popular vote. President for the term ending Oct. 12, 1916, Roque Saenz Peña; vice-president, Victorino de la Plaza. President Saenz Peña died Aug. 9, 1914, and was succeeded by the vice-president.

HISTORY. On Feb. 9, 1914, the ministry (formed in 1910) resigned, since President Saenz Peña, on account of protracted illness, had just turned over his functions to the vice-president, Dr. Victorino de la Plaza, and it was desirable that the new chief magistrate should have a free hand in choosing his ministers. The new cabinet was constituted as follows: interior, Señor Miguel Ortiz; foreign affairs and worship, José Luis Muratore; finance, Enrique Carbó; justice and education, Tomás R. Cullen; agriculture, Horacio Calderón; public works, Manuel Moyano; war, General Vélez; marine, Rear-Admiral P. Saenz Valiente. In May, Vice-President Plaza opened Congress and delivered his vice-presidential message, commenting on the financial situation, and the economies which would reduce the budget by more than \$11,000,000, to counterbalance the decrease of customs revenues. He called attention to the fact that Argentina was the leading country in South America, and the ninth in the whole world, in the mileage of her railways. The budget for 1915 showed a decrease of 50,000,000 paper *piastres*. See MEXICO, paragraph A. B. C. Mediation, and INTERNATIONAL ARBITRATION AND PEACE.

ARGYLL, JOHN DOUGLAS SUTHERLAND CAMPBELL, ninth DUKE OF. Died May 2, 1914. He was born in London in 1845, the son of the

eighth Duke of Argyll and of Elizabeth, eldest daughter of the second Duke of Sutherland. He was educated in Edinburgh Academy, St. Andrews, and Trinity College, Cambridge. He was a member of Parliament from 1868 to 1878. In 1871 he married Princess Louise, fourth daughter of Queen Victoria. He was appointed Governor-General of Canada in 1878, and held this position until 1883. From 1895 to 1900 he represented South Manchester in Parliament, and in the latter year he succeeded his father in the dukedom. In addition to his title, Duke of Argyll, he held many others, among them being Marquis of Lorne and Kintyre, Earl of Campbell and Cowal, Viscount of Lochow and Glenisale, Baron Inveraray, Mull Morvern and Tiry. He was Chancellor of Order of Sts. Michael and George; Hereditary Master of the Royal Household, Scotland; Hereditary High Sheriff of the County of Argyll; Admiral of the Western Coast and Isles. He was also Keeper of the Great Seal of Scotland and of the Castles of Dunstaffnage, Dunoon, and Garrick. From 1892 until his death he was Lord-Lieutenant of Argyllshire and Governor and Constable of Windsor Castle. He was a prodigious worker. He wrote poetry, works of biography, history, travel, and drama, and a grand opera. Among his published works are: *The United States of America after the War*; *Memories of Canada and Scotland*; *Tales and Poems*; *Psalms in English Verse*; *Life and Times of Queen Victoria*; and, *Intimate Letters of the Eighteenth Century*. He received the Order of the Garter at the coronation of King George, and was selected to edit the letters of King Edward. He is succeeded in the dukedom by Niall Diarmid, son of the late Lord Walter Campbell and cousin of the ninth Duke.

ARIZONA. POPULATION. The estimated population of the State on July 1, 1914, was 239,053. In 1910 it was 204,354.

AGRICULTURE. The area, production, and value of the principal crops in 1913-14 are shown in the following table. The figures are from the United States Department of Agriculture, and those of 1914 are estimates only.

		Acreage	Prod. Bu.	Value
Corn	1914	18,000	576,000	\$ 691,000
	1913	17,000	476,000	524,000
Wheat	1914	31,000	868,000	1,085,000
	1913	29,000	928,000	1,021,000
Oats	1914	8,000	336,000	235,000
	1913	7,000	301,000	150,000
Barley	1914	35,000	1,260,000	756,000
	1913	38,000	1,482,000	1,082,000
Potatoes	1914	1,000	110,000	132,000
	1913	1,000	75,000	101,000
Hay	1914	142,000	454,000	3,995,000
	1913	135,000	540,000	5,940,000

a Tons.

MINERAL PRODUCTION. Arizona ranks first among the States in the production of copper, and nearly 90 per cent of the total value of all her mineral products is represented by the copper contained in the ores mined in the State. Arizona was one of the few States in which the production of copper in 1913, both in quantity and value, exceeded that of 1912. The gain in value, however, was less than half, proportionately to the increase in output, the total production having shown an increase of more than 10 per cent in quantity, with a gain of less than 5 per cent in value. The recoverable copper content of the ores mined in the State increased from 365,038,649 pounds, valued at \$60,231,377

in 1912, to 407,923,402 pounds, valued at \$63,228,127 in 1913.

Second in importance among the mineral products of the State is gold, in the production of which Arizona ranks seventh. The total production of gold in 1913 was 194,657 fine ounces, valued at \$4,023,911, compared with 181,997 fine ounces, valued at \$3,762,210 in 1912. The silver production, which is largely a by-product from the smelting of copper ores, amounted in 1913 to 3,948,091 fine ounces, valued at \$2,384,647, compared with 3,490,387 fine ounces, valued at \$2,146,588 in 1912. Some lead and zinc are also produced in the State, the former being in value a little over \$700,000 and the latter nearly \$530,000 in 1913. According to the estimates of the United States Geological Survey, the value of the gold, silver, copper, lead, and zinc produced in 1914 decreased over 16 per cent compared with the production of 1913. This was due chiefly to the lower price of copper on account of the European war. The total value of these minerals in 1914 is estimated at \$59,000,000, compared with \$70,875,027 in 1913. There was very little decrease, however, in the output of copper, lead, and zinc and considerable decreases were made in gold and silver. The gold production in 1914 was valued at \$4,570,000, while silver made a record production of 4,469,000 ounces. The output of copper decreased from 407,923,402 pounds in 1913 to about 388,000,000 pounds in 1914. The output of lead was practically the same as that of 1913, or about 16,000,000 pounds. The zinc production was also about equal to that of 1913.

The nonmetalliferous products of the State are cement, clay wares, fluorspar, gypsum, gems, lime, sand and gravel, silica, and stone. The combined value of these, however, was little more than \$500,000 in 1913. Small quantities of quicksilver and tungsten ores are also produced. The total value of the mineral products of the State increased from \$67,407,838 in 1912, to \$71,429,705 in 1913.

EDUCATION. The total school population of the State in 1914 was 86,282. The total enrollment in the public schools was 43,926, and the average daily attendance was 29,898; the teachers numbered 1101, and the average monthly salary of these was \$114.03.

TRANSPORTATION. The total railway mileage operated in Arizona on June 30, 1914, was 2345. The roads having the longest mileage include the following: Atchison, Topeka and Santa Fe, 978; Southern Pacific, 537; Arizona Eastern Railroad, 378; El Paso and Southwestern, 263.

FINANCE. The total receipts for the fiscal year ending June 30, 1914, amounted to \$2,770,571. The disbursements for the same period amounted to \$3,051,356. There was in the treasury in the beginning of the fiscal year a balance of \$1,034,083, and at the end a balance of \$753,298. The funded debt of the State consists wholly of bonds, of which the greater part were issued for funding purposes, amounting in 1913 to \$3,528,275. To provide for the payment of the principal and interest, the State board of equalization determines the tax levies of the several counties and cities. The floating debt of the State consists of outstanding warrants, the amount of which on June 30, 1913, was \$66,096. The per capita debt in 1913 was \$4.19, a decrease from \$11.19 in 1908.

CHARITIES AND CORRECTIONS. The charitable

and correctional institutions of the State are as follows: The State Prison at Florence, State Industrial School at Fort Grant, State Hospital for the Insane at Phoenix, Home for Aged and Infirm Arizona Pioneers at Prescott, the Florence Crittenden Home at Phoenix, Arizona Children's Home at Phoenix, and St. Luke's Home at Phoenix. The latter is a tubercular sanatorium conducted by the Protestant Episcopal Church. In 1913 provision was made for a board of pardons and paroles, to replace the present board of commissioners of paroled prisoners, which previously had charge of these matters.

POLITICS AND GOVERNMENT. The State Legislature did not meet in 1914 as the sessions are biennial and the last was held in 1913. The date for the next session is Jan. 11, 1915. Elections were held for Governor and United States Senator. Governor Hunt was a candidate for reelection as was also Senator Marcus A. Smith, and both were renominated. The elections on November 3 resulted in the election of Governor Hunt, who received 35,228 votes, as against 17,602 votes for Cameron, his Republican opponent. For the Senate Smith received 25,800 votes, against 9183 for Hubbell, the Republican candidate. The Progressive candidate received 2808 votes. The constitutional amendment providing for Prohibition was submitted to the people at this election and it was carried by about 3000 votes.

The validity of the alien land laws passed by the Legislature of 1913 to prevent Japanese from settling in the State was before the United States District Court in California during the year. No decision had been rendered at the close of the year, but it was a very general opinion that it would be adverse to the laws. The measure passed corresponded closely to those first passed in the California legislature and afterwards abandoned. They directly prohibited aliens who had not declared their intention of becoming citizens from acquiring land. At the time of its passage protests were made against the bill by the Japanese Association of Arizona, but no active measures were taken against its passage by the United States Government.

STATE OFFICERS, 1915. Governor, George W. P. Hunt; Secretary of State and Lieutenant-Governor, Sidney P. Osborn; Treasurer, Mitt Sims; Auditor, J. C. Callaghan; Adjutant-General, Charles W. Harris; Attorney-General, Wiley E. Jones; Superintendent of Education, C. O. Case; Commissioner of Insurance, to be appointed—all Democrats. Supreme Court: Chief Justice, Alfred Franklin; Associate Justices, D. L. Cunningham, Henry D. Ross; Clerk, Clay F. Leonard—all Democrats.

The representatives in Congress will be found in the section *Congress*, article UNITED STATES.

ARIZONA, UNIVERSITY OF. A State institution for higher education, founded at Tucson, Ariz., in 1885. The number of students enrolled in all departments of the university in the autumn of 1914 was 249, and the faculty numbered 43. R. B. von Kleinamid was appointed president in 1914 to succeed Arthur H. Wilde, resigned; four members of the faculty were on sabbatical leave during the year; Charles W. Clapp, of the Canadian Geological Survey, was appointed professor of geology; Lloyd L. Dineen was appointed associate professor of mathematics, and Colonel George LeRoy Brown was appointed professor of military science and head of the military department. The university is supported by State appropriations. The library contains about 22,000 volumes.

ARKANSAS. POPULATION. The estimated population of the State on July 1, 1914, was 1,686,480. In 1910 the population was 1,574,449.

AGRICULTURE. The area, production, and value of the principal crops in 1913-14 are shown in the following table. The figures are from the United States Department of Agriculture, and those of 1914 are estimates only.

		Acreage	Prod. Bu.	Value
Corn	1914	2,400,000	42,000,000	\$83,600,000
	1913	2,475,000	47,025,000	86,680,000
Wheat ..	1914	125,000	1,625,000	1,609,000
	1913	101,000	1,813,000	1,182,000
Oats	1914	260,000	6,240,000	3,807,000
	1913	240,000	6,860,000	3,871,000
Rye	1914	1,000	10,000	10,000
	1913	1,000	12,000	11,000
Rice	1914	92,580	8,685,000	3,816,000
	1913	104,700	3,769,000	3,892,000

Cotton ...	1914	2,525,000	1,040,000	32,858,000
	1913	2,502,000	1,073,000	59,580,000

a Tons. b Pounds. c Bales.

MINERAL PRODUCTION. Arkansas is first among the States in the production of two minerals—bauxite and novaculite, the former being the ore of aluminum, and the latter the source of the larger part of the oilstones produced in the United States. The principal mineral product, however, is coal, the value of which constitutes over 50 per cent of the State's total. The total value of all the mineral products in 1912 was \$6,258,726, compared with a value of \$6,780,760 in 1913. The coal production in 1913 was 2,234,107 short tons, valued at \$3,923,701, compared with 2,100,819 short tons, valued at \$3,582,789 in 1912. Approximately 70 per cent of the total production of coal comes from Sebastian County. Bauxite is second among the mineral products. In 1913 the stone quarries of the State furnished products valued at \$535,050. The only metalliferous products of Arkansas besides bauxite are lead, zinc, and manganese ores. Other mineral products are fuller's earth, gems and precious stones, lime, mineral waters, natural gas, phosphate, rock, and slate.

TRANSPORTATION. There were in the State in 1913, 4797 miles of main track and 764 miles of side track. There were in addition ten operating electric railways, with 113 miles of track.

EDUCATION. The total school population of the State on June 30, 1914, was 635,462, with a total enrollment in the public schools of 439,624, and an average daily attendance of 298,597.

The male teachers numbered 4531 and the female 5830, the average yearly salary of all teachers being \$317.32. The total number of school houses was 6429 in 1914, and 341 new buildings were erected, the total value of school property in the State being \$11,956,315, and the expenditures for schools \$4,360,965. The schools of the State have shown remarkable progress in recent years.

FINANCE. On Sept. 30, 1912, the funded debt of the State consisted of only one series of bonds issued in 1889, at which time the total debt of the State was refunded; these bonds, amounting to \$1,250,000, are all held by the permanent school fund. The State has no floating debt. The per capita debt in 1912 was \$0.76. The receipts for the fiscal year 1911-12 were \$6,899,247, and the expenditures were \$6,734,915, leaving a balance at the end of the year of \$800,770. The income is derived chiefly from direct tax on all property, and the expenditures are chiefly for charitable and State institutions.

CHARITIES AND CORRECTIONS. The charitable and correctional institutions of the State are the State Hospital for Nervous Diseases at Little Rock, Deaf Mute Institute at Little Rock, School for the Blind at Little Rock, Confederate Soldiers' Home at Sweet Home, the Arkansas State Penitentiary and State Farm, and the Arkansas Reform School at Little Rock. The charitable institutions are under the control of a board of trustees on charitable institutions, and the correctional institutions by the State penitentiary commissioner.

POLITICS AND GOVERNMENT. There was no meeting of the Legislature in 1914 as the sessions are biennial and the last was held in 1913. State elections were held for Governor and United States Senator. Both Governor Hays and Senator Clarke were candidates for reelection and, at the primaries held on March 24, both were renominated. At the State election held on September 14, Governor Hays was reelected with 94,096 votes, against 30,987 for Kenney, his Republican opponent. Senator Clarke received 33,449 votes, compared with 22,297 for Meyers, his Republican opponent. The Progressives made no nominations in the campaign.

STATE OFFICERS, 1915. Governor, George W. Hays; Lieutenant-Governor, —; Secretary of State, Earle W. Hodges; Treasurer, Rufus G. McDaniel; Auditor and Insurance Commissioner, L. L. Coffman; Attorney-General, W. L. Moose; Superintendent of Education, Geo. B. Cook; Commissioner of Agriculture, J. H. Page; Commissioner of Public Lands, W. B. Owen—all Democrats. Supreme Court: Chief Justice, Edgar A. McCulloch; Justices, F. G. Smith, C. D. Wood, William F. Kirby, and Jesse C. Hart; Clerk of the Court, P. D. English—all Democrats.

STATE LEGISLATURE, 1915.

The representatives in Congress will be found in the section *Congress*, article UNITED STATES.

ARKANSAS, UNIVERSITY OF. A State institution for higher education, founded at Fayetteville, in 1871. The enrollment in all de-

partments in 1914 was about 800, and there were 80 members in the faculty. The institution is supported by appropriations from the State legislature, and the annual income is about \$20,000. The library contains 20,000 volumes. The president is J. C. Futrall, M.A.

ARMAMENT. See BATTLESHIPS.

ARTIFICIAL DIAMONDS. See CHEMISTRY, INDUSTRIAL.

ARTIFICIAL WOOD. See CHEMISTRY, INDUSTRIAL.

ARTILLERY. See MILITARY PROGRESS, and section *Army*, under UNITED STATES, and under various foreign countries.

ASBESTOS. The production of asbestos in the United States is small, but in manufactured asbestos products that country surpasses any other. The total output of the mineral in 1913 in the United States was about 1100 short tons, valued at \$11,000, all of which came from two producers in Georgia and one in Arizona. The largest production made was in 1911, when the output amounted to 7604 short tons, valued at \$119,935. The world's supply of asbestos is drawn largely from the Province of Quebec in Canada, although the rapid development of the Russian output was making that country an important factor in the world's supply. The total output in Canada in 1912 was 111,561 short tons of asbestos and 24,740 short tons of asbestic. In the same year there were produced in Russia 18,138 short tons of asbestos. There were imported into the United States in 1913, 86,737 short tons of unmanufactured asbestos, valued at \$1,928,705, and manufactures of asbestos valued at \$389,664. For the fiscal year ending June 30, 1914, the imports of unmanufactured asbestos amounted to 76,524 tons, valued at \$1,678,736; and manufactures of this material valued at \$391,337.

ASIA. See ANTHROPOLOGY; EXPLORATIONS; and articles on the various Asiatic countries.

ASIA MINOR, EXPLORATIONS IN. See ARCHAEOLOGY.

ASPHALT. The production of natural asphalt, including all the varieties of natural asphalt, asphaltic sandstone, and limestone, amounted in 1913 to 92,604 short tons, valued at \$750,713. This was a decline from 95,166 short tons, valued at \$865,225 in 1912. This decline in natural products was undoubtedly due to the fact that not only oil asphalt dominates the industry but that its relative importance is increasing at the expense of the natural varieties. In 1913, 436,586 short tons of oil asphalt were produced in the United States, compared with 354,344 short tons in 1912. The value of the product in 1913 was \$4,531,657. The chief States producing oil asphalt are California, Kentucky, Oklahoma, and Utah. The chief producing countries are Trinidad, Italy, and Venezuela. The largest quantity is produced in Trinidad. The imports of asphalt of all kinds in the United States in 1913 amounted to 228,178 short tons, valued at \$910,611. The exports were valued at \$1,640,027. This included unmanufactured, and manufactures of, asphalt. Under the law which became effective Oct. 4, 1913, all asphalt ex-

cept manufactured products is imported free of duty. From that date, and up to June 30, 1914, there were imported 139,093 tons of asphaltum and bitumen, valued at \$687,299. From July 1 to Oct. 3, 1913, manufactured products of asphalt to the extent of 41,596 tons and valued at \$231,088 were imported.

ASQUITH, HERBERT HENRY. See **GREAT BRITAIN, History, passim.**

ASTRONOMY. Steady progress in all branches of astronomical science marked the year 1914, although, owing to the outbreak of war, the activities of some of the European observatories appear to have been seriously curtailed. A new satellite—the ninth—of Jupiter was reported to have been discovered, but the details were meagre, and the discovery needs confirmation. Several expeditions were dispatched to stations in Russia and other countries along the line of totality for the purpose of observing the total eclipse of the sun which occurred on August 21. Although the radiation in the green due to coronium was reported to be absent, the eclipse was noteworthy on account of the discovery of a new coronal radiation in the red. For the first time since 1903 the number of new minor planets discovered fell below fifty. Encke's comet, first seen in 1789, and recognized as periodic thirty years later, made its 39th reappearance, and four new comets were found.

MOUNT WILSON SOLAR OBSERVATORY. In his report of the work carried on by himself and his associates during 1913 at the Mount Wilson Solar Observatory, Professor George E. Hale summarized the principal results of the year, and again emphasized the importance of those obtained from the coöperation of foreign astronomers in the work of the observatory. Professors Kapteyn of Groningen, Hertzsprung of Potsdam, and Störmer of Christiania continued their researches of the preceding year. The first-mentioned found strong evidence of the absorption of light in space. His conclusions are summarized briefly as follows: On the average the fainter stars are redder than those which are brighter, and the redder the stars the more distant, apparent magnitudes and spectral lines being the same. Professor Hertzsprung's work on the effective wave lengths of the light of faint stars also had a direct bearing on the question of the absorption of light in space; the work of reducing the negatives obtained is still proceeding. Professor Störmer's theoretical investigations of the nature of the vortices in sun spots led to the view that the hydrogen whirls of the flocculi are not current lines but magnetic lines of force due to a low-lying whirl, to the spiral current lines of which they are orthogonal. Taking into account Professor Hale's investigations on the magnetic phenomena of sun-spots and Mr. St. John's work on the radial motion of the spot vapors, Störmer reached the conclusion that the sun's magnetic field is produced by the motion in the vortex of negatively charged particles. Since his return to Europe, he has calculated the magnetic field over a spot vortex, and has estimated the dimensions of the vortex necessary to harmonize with the observed facts.

Professor Kohn, of Munich, spent several months at the observatory for the purpose of testing his microphotometer with reference to its applicability to the study of solar and stellar spectra. By means of this instrument, which

was devised by Professor Koch in 1912, it is possible to obtain an automatic record of the variations in the density of a photographic negative. It consists essentially of a microscope, on the stage of which is mounted the photograph of the spectrum to be investigated, and a photo-electric cell which replaces the eyepiece of the microscope. As the image of the silver deposit in the negative is made to move across a slit in the upper focal plane of the objective, the variations in the intensity of the illumination cause corresponding changes in the electromotive force developed in the photo-electric cell, and these in turn are indicated by the movements of a string electrometer. The automatic registration of the changes is obtained by projecting an image of the string across a second slit placed immediately in front of a photographic plate which moves at right angles to the slit. In this way, personal errors are entirely eliminated, and the results so far obtained give promise that the instrument will prove to be absolutely indispensable in the prosecution of spectroscopic research of all kinds.

THE SUN'S MAGNETIC FIELD. In the Annual Report of the Director of the Mount Wilson Solar Observatory for 1913, Prof. George E. Hale announced that his researches on the sun's general magnetic field left no doubt as to its existence and order of intensity. By choosing a period of minimum solar activity for the investigation, the disturbing influences due to the intense magnetic fields in sun spots were eliminated. The results so far obtained warrant the conclusion that the sun is a magnet, with its north and south poles situated at or near the corresponding poles of rotation, and that the intensity of the field is about 80 times as great as that of the earth and about one-hundredth of that of the most intense sun spots. As most of the solar lines which exhibited the Zeeman effect are produced at low levels in the solar atmosphere, while others, which show large displacements in the laboratory, failed to give any indication of the sun's field, it is inferred that the intensity of the field falls off very rapidly in receding from the surface of the photosphere. It was suggested that the correspondence between the polarities of the sun and the earth may be found to have an important bearing on the various theories which have been propounded to account for the earth's magnetism, but at the same time it was pointed out that the analogy in regard to the rates at which the fields fall off is not complete.

RADIAL VELOCITIES IN SUN SPOTS. Mr. Chas. E. St. John continued his researches on the radial motion of the vapors in the solar atmosphere overlying sun spots. The results obtained were in entire accord with Evershed's hypothesis that the displacements of the spectrum lines observed are due to a movement of the solar vapors tangential to the surface of the sun and radial to the axis of the spot vortex. Velocity inversion occurs at an elevation of about 4000 kilometers, the flow above that level being inward toward the centre of the spot while below it is outward, and the velocities increase with the distance from the layer in which the inversion takes place. Considerations of the amount of energy involved in the inflow and outflow led to the conclusion that the actual vortex is deep-seated, its head being situated near the reversing layer, and the inflow from the

chromosphere, in which vortex motion is sometimes observed, is regarded as a secondary effect depending upon the strength of the magnetic field and the rotational energy of the vortex proper.

TOTAL ECLIPSE OF THE SUN. Owing to the great progress of solar physics during the past twenty years, observations made during a total eclipse of the sun are of less importance than they were formerly, and it has been seriously questioned whether the gain in our knowledge of the sun is at all commensurate with the expenditure of time and money involved in fitting out solar eclipse expeditions. Nevertheless, on account of the comparative ease with which suitable stations could be reached, several expeditions were planned for the purpose of viewing the total eclipse of the sun which occurred on August 21. The line of totality stretched from Northern Canada to the northwest coast of India, crossing Greenland, Norway, Sweden, Russia, Eastern Asia Minor, and Western Persia. The majority of the expeditions originally contemplated made all arrangements to proceed to Feodosia, in the Crimea, where the weather conditions gave greatest promise of being favorable. Among these were parties from the United States, Great Britain, France, Germany, Spain, and Russia. Other parties planned to make their headquarters and establish their observing stations at Kiev, Minsk and Riga, in Russia, at Alsten Island, off the coast of Norway, and at Hernösand and Strömsund, in Sweden. Owing, however, to the outbreak of the European war, some of the expeditions were abandoned altogether, while others, which started, were unable to proceed to their stations. Apart from the Russian parties, only six expeditions—two British, two French, one American, and one Spanish—succeeded in reaching their destinations. All agreed in reporting the corona as of intermediate type, i.e., of the square type, there being no large equatorial streamers or streamers in the regions of the solar poles. The green radiation attributed to coronium was entirely absent, but a new intense and sharp radiation, which appears to be directly associated with periods of minimum solar activity, was observed in the red portion of the spectrum.

SOLAR CONSTANT OF RADIATION. In his address as retiring president delivered before the Philosophical Society of Washington on January 3, Dr. C. G. Abbot discussed the general problem of solar radiation, and described the methods employed by himself and other observers of the Smithsonian Astrophysical Observatory in determining the solar constant. The mean value of this constant, as derived from 690 measurements made at Washington, Mount Wilson, Mount Whitney, and Bassour, Algeria, during the period 1902–13, was found to be 1.933 calories per square centimeter per minute, and is believed to be accurate to within one per cent. There is a possibility that one or two per cent has been lost in the ultra-violet region of the spectrum through absorption by ozone in the upper atmosphere. The constant is subject to a long-period variation corresponding to the sun-spot period, and a more irregular fluctuation of about ten per cent, with a period of about a week or ten days, was detected, which is attributed to changes in the sun's emission.

SUN SPOTS. The minimum in the present cycle of solar activity was reached in 1913, when

the sun's disc was freer from spots than it has been during any year since 1810. A recrudescence of activity was noted during the year.

From an examination of the sun spot records made at the Zurich Observatory during the period 1876–1911, Fräulein Frenkel found indications of two short-period variations in the frequency of sun spots, of 68.5 days and 200 days respectively, and suggested a possible connection with the rotation periods of the two inner planets, Mercury and Venus.

JUPITER. The Great Red Spot was under observation and showed an increased velocity, its period of rotation being 9 hours, 55 minutes, 35 seconds, or about 6 seconds shorter than the period noted in 1912. The equatorial current was also found to have increased its rate of movement, the rotation being accomplished in 9 hours, 50 minutes, 11 seconds. The great South Temperate Spot is now in advance of the red spot, and as it is increasing in length, it will probably eventually extend all round the planet, and obliterate the previously brilliant south tropical zone.

A PROBABLE NEW SATELLITE OF JUPITER. Nicholson announced the discovery at the Lick Observatory of a small object near Jupiter on July 21, which appears to be a new satellite—the ninth—of the planet. It is said to be of the 19th magnitude, and is therefore probably smaller than the eighth satellite discovered by Melotte in 1908, which is of the 17th magnitude and only about 40 miles in diameter. Its motion is stated to be retrograde, and its period is estimated to be about three years.

ROTATING NEBULA. Professor Slipher, of the Lowell Observatory, Flagstaff, Ariz., announced that he had obtained spectroscopic evidence of rotation in the Virgo Nebula, the velocity indicated being fully 1000 kilometers per second. The prevalence of spiral forms among the nebulae has long been held to indicate that the nebulae in general possess motion of rotation about an axis, and the important discovery just made tends to confirm this belief.

NUMBER AND TOTAL LIGHT OF THE STARS. In an interesting article which appeared in *Nature*, Mr. S. Chapman gave an account of the important conclusions concerning the number and light of the stars to which his study of the Franklin-Adams star charts had led. This fine series of charts comprises 206 plates, covering the whole sky and showing, in most cases, stars down to the seventeenth magnitude. By counting the stars in 25 uniformly distributed sample areas on each plate, and classifying them according to the size and grayness of their images, it was possible to form an estimate of the number of stars of each magnitude. While the very brightest stars show great irregularity of grouping, it is a matter of simple visual observation that the fainter naked-eye stars are more numerous in the plane of the Milky Way than at the galactic poles, the ratio being about two to one. This ratio becomes greater for the telescopic stars from the fifth down to the ninth magnitude, being about three or four to one, and it has been held by Kapteyn and others that for still fainter stars the galactic condensation increases with increasing faintness. Pickering, on the other hand, maintains that, down to the thirteenth magnitude, there is no increase in the condensation, and the figures adduced by Chapman for stars down to the limit of the charts

strongly support this view. Starting from this, Chapman shows that it is possible to calculate the total number of stars, and estimates that it lies somewhere between 1000 million and 2000 million, half of which are brighter than a magnitude of about 23 or 24, the faintest magnitude that could possibly be photographed with the largest telescope at present available. When the total light of the stars of each magnitude is estimated, the result is less impressive. Assuming the correctness of the formula by which the number of the stars is calculated, it is possible to proceed still further and to calculate the total intensity of all the stars brighter than a given magnitude, and it is found that the total light of the stars is equal to that of 700 stars of the first magnitude, or of a single star of magnitude -6.1. A further interesting comparison was made with the light of the full moon, and of the standard candle. The total light of the stars was estimated to be about one-hundredth of that of the full moon, and equal to that of an ordinary 16-candle-power electric lamp at a distance of forty-five or fifty yards.

VARIATION OF LATITUDE. The results published by the International Latitude Service for 1912 and 1913 showed that the amplitude of variation has decreased considerably since the beginning of 1912. A chart showing the wandering of the pole for the period 1906-11 will be found on page 58 of the YEAR BOOK for 1912.

Boccardi published tables showing that the small diurnal variations of the latitude can be distinctly attributed to the attraction of the moon.

MINOR PLANETS. Since the last issue of the YEAR BOOK, sixty-three minor planets have been announced as new. Nine of these were reported in December, 1913, three—1906 WF_a, WF_b, WF_c—having been identified on reexamination of negatives taken as far back as 1906 by Kaiser at Heidelberg; the remaining six are provisionally designated by the letters 1913 TR to 1913 TW. Nine others were photographed in 1913, but their character was only recognized later on examination of the plates. They were all found on negatives taken by Lampland at the Lowell Observatory at Flagstaff, Ariz., and were designated 1913a to 1913i by their discoverer. Owing, however, to the fact that insufficient observations were obtained, they appear to have failed of recognition by the Recheninstitut at Berlin. The remaining 45—actually discovered in 1914—received the provisional designations 1914 TX to 1914 VR. It is to be remarked that this is the first year since 1903 in which the number of minor planets announced as new has failed to reach the half-century mark; the number in 1903 was 47. Disregarding the Flagstaff planets, of the 54 reported since the issue of the YEAR BOOK for 1913, 34 were announced from the Konigstuhl Observatory at Heidelberg by Professor Wolf (10), and his assistants, Kaiser (14), Reinmuth (7), and Massinger (3). Of the remaining 20, 10 were discovered by Neujmin (Simeis), 3 each by Palisa (Vienna), and Thiele (Bergedorf), and 1 each by Lagrula (Nice), Le Morvan (Paris), and Metcalf (Winchester, Mass.), while 1 (UL) was found independently by Lagrula and Palisa.

Permanent numbers were assigned to the following minor planets:

Number	Temporary Designation	Discoverer	Date of Discovery
755	1908—CZ	Metcalf	1908—April 6
756	DO	Metcalf	April 26
757	EJ	Metcalf	Sept. 80

Eleven of these numbered planets were identified with others previously known. They are: 764 (1913 SU)=1908 FD=1902 KP; 767 (1913 SX)=1902 JT; 772 (1913 TR)=1902 KM; 773 (1913 TV)=1910 JS; 774 (1913 TW)=1908 FG (very probably); 776 (1914 TY)=1910 KA; 780 (1914 UC)=1909 GH; 781 (1914 UF)=1908 BZ; 782 (1914 UK)=1911 LZ; 783 (1914 UL)=1911 MO=1910 JM.

Other identifications were as follows: 1913 SP=492, Gismonda; 1913 TD=639, Latona; 1913 TJ=486, Cremona (very probably); 1913 TN=567, Eleutheria; 1913 TP=294, Felicia; 1913 TT=770 (1913 TE).

Names were assigned to the following minor planets: 712, Boliviana; 728, Leonisia; 748, Simeisa; 749, Malzovia; 751, Faina; 758, Mancunia; 771, Libera.

COMETS. The periodic comets due to return in 1914 were Encke's (first observed in 1789), Tempel-Swift's (1869 III), and Metcalf's (1906 VI). Of these only Encke's was reported. It is noteworthy as being only the second comet to be recognized as periodic, the first being Halley's Comet. This fact was established by Pons in 1819, and since then the comet has been detected at every reappearance, the present being the thirty-ninth since its discovery. This year it was first seen by Barnard at the Yerkes Observatory on September 17. It is designated 1914d, and made its perihelion passage on December 4. As usual, when its perihelion passage occurs in winter, it was a fairly conspicuous object.

Tempel-Swift's Comet, first observed by Tempel at the end of 1869, and recognized as periodic by Swift in 1880, has a period of 5.68 years. It was not seen in 1886, 1897, or 1903 when it was due, but it was well observed in 1891, and was also seen on the occasion of its last reappearance in 1908. It was not detected in 1914. Metcalf's Comet has a period of 7.6

years. It was first seen on Nov. 14, 1906, having passed through perihelion on October 11 in that year. It should therefore have made its first reappearance this year, but failed of detection.

Four new comets were discovered in 1914. These were: 1914a, discovered by Kritzing at Bothkamp, Germany, on March 29. It passed through perihelion on May 31. When first seen, it was of magnitude 9.5, and possessed a fairly conspicuous tail. Its brilliancy increased slowly, reaching its maximum (magnitude 8.4) on May 12.

1914b, discovered by Zlatinsky at Mitau, Russia, on May 15. It made its perihelion passage on May 8. It was reported as showing a stellar nucleus of the fourth magnitude, with a tail 12 degrees in length, but its brightness rapidly declined. Slipher announced that its spectrum showed long carbon and cyanogen bands, and resembled closely those exhibited by the comets discovered by Brooks in 1911 and Gale in 1912. Perrine called attention to the similarity between its elements and those of Comet 1790 III, discovered by Caroline Herschel, but the identification does not appear to be complete.

1914c, discovered by Neujmin at Simefs, Crimea, on June 29. It was of magnitude 12.5 when first detected, and soon became very faint. It passed through perihelion on February 11.

1914e, discovered by Lunt at Johannesburg, South Africa, on September 18, and independently by several observers about the same time. It passed through perihelion on August 5.

Mention should also be made of Delavan's Comet (1913f), which made its perihelion passage on October 26, and was under observation during the greater part of the year. In the early summer it was invisible owing to its unfavorable position, but about the end of July it again became visible, and during September and October could be seen with the naked eye.

NEW OBSERVATORIES. The imperative need of the Canadian Dominion astronomers for a larger and more modern telescope is at last to be met by the construction of a 72-inch reflecting telescope, the Dominion government having made a grant of about \$200,000 for that purpose. The large mirror, which is to have a focal length of 30 feet, will have a hole in its centre, 10 inches in diameter, so as to allow for the use of a Cassegrain combination. Placed at a distance of 23 feet from the large mirror will be a convex hyperboloidal mirror, with an aperture of 19 inches and a focal length of 10 feet, so that the resulting focal length of the instrument will be 108 feet. The mounting will resemble that of the great Melbourne reflector. The instrument will be used primarily for the spectroscopic determination of radial velocities, but will also be available for the direct photography of nebulae, clusters, and other restricted areas of the sky. As the result of an investigation, extending over more than a year, into the suitability of a large number of sites in the Dominion, it was found that the vicinity of Vancouver, British Columbia, possessed the requisite qualifications of clear atmosphere and small nocturnal range of temperature, and accordingly the observatory in which the new instrument will be housed is to be located at an elevation of about 700 feet on Little Saanich Mountain, about seven miles north of Vancouver. The government of British Columbia has appropriated

\$10,000 for the purchase of the land—50 acres—and to build a road to the summit of the hill. It is expected that the telescope will be mounted and ready for use by the end of 1915.

Through the generosity of Mr. Joseph Cawthron, who has given \$250,000 for the purpose, a new Solar Physics Observatory is to be established near Nelson, New Zealand.

LARGE TELESCOPES. In the *Observatory*, Hollis published a list of the large telescopes—both refracting and reflecting—having apertures of 20 inches or more, which are at present in use or under construction. Those now being constructed are as follows:

REFRACTORS

Aperture in Inches	Observatory
32.....	Nicolaieff, Russia.
26.....	Johannesburg, South Africa.
24.....	Córdoba, Argentina.
24.....	Santiago, Chile.
24.....	Detroit, Michigan.
20.....	Oakland, California.

REFLECTORS

100.....	Mount Wilson, California.
72.....	Vancouver, British Columbia.
40.....	Simefs, Crimea.
30.....	Helwan, Egypt.
30.....	Mr. D'Esterre's Observatory, Surrey, England.

OTHER EVENTS. A Royal Medal of the Royal Society of London was awarded to Prof. Ernest W. Brown, of Yale University, for his investigations in astronomy, chiefly in lunar theory.

BOOKS. Among the more important works on Astronomy published in 1914 may be mentioned: Moulton, *Introduction to Celestial Mechanics*; Housden, *The Riddle of Mars, the Planet*; Sampson, *The Sun*; Price, *The Essence of Astronomy*; Orr, *Dante and the Early Astronomers*; Duhem, *Le Système du Monde*; Raper, *The Practice of Navigation, and Nautical Astronomy*; Tycho Brahe Dani, *Opera Omnia*, vol. i.; Eddington, *Stellar Movements and the Structure of the Universe*. See also CARNEGIE INSTITUTION.

ATHLETICS. See under the various sports, as BASEBALL, BASKETBALL, CYCLING, BILLIARDS AND POOL, BOWLING, BOXING.

ATHLETICS, TRACK AND FIELD. The athletic event of the year 1914 which attracted the most widespread interest was undoubtedly the four-mile intercollegiate relay race at the carnival held in Philadelphia under the auspices of the University of Pennsylvania. The contest was won by the team of Oxford University after the closest and most exciting race of its kind ever contested. The Oxford quartette consisted of A. N. S. Jackson, whose brilliant sprint on the last lap brought victory for his team; Norman S. Taber, an American Rhodes scholar from Brown University; D. M. Sproule and D. S. Gausson. The Pennsylvania runners, who finished second, comprised Bacon, Langner, Madeira, and McCurdy. Cornell captured third place with Soudar, Potter, Irish, and Speiden.

The year also saw the rising of a new athletic star in the person of Joseph Loomis of the Chicago A. A. Loomis suddenly broke into the limelight at the national meet of the A. A. U. in Baltimore by capturing the 100-yard dash, the 220-yard hurdle race, and the running high jump. Homer Baker of the New York A. C. was another American athlete to gain fame during the year. At home he won the national

half-mile championship. While abroad he carried off several titles in England, Scotland, Germany, and Denmark. His most notable performance was in the English 880-yard race where he made the fast time of 1 minute 54 $\frac{1}{2}$ seconds.

Laurels in sprinting belong to Howard P. Drew of the University of Southern California. He ran 90 yards in 9 $\frac{1}{2}$ seconds and 120 yards in 11 $\frac{3}{4}$ seconds, both new records, and equaled the 100-yard and 220-yard world's figures of 9 $\frac{3}{4}$ seconds and 21 $\frac{1}{4}$ seconds, respectively. Other American sprinters to distinguish themselves were Alvah Meyer of the Irish-American A. C. of New York, A. Butler of Hutchinson High School, Kansas, and George Parker of the Olympic Club, San Francisco. Meyer and Butler equaled the 60-yard record of 6 $\frac{3}{4}$ seconds and Parker equaled the furlong mark of 21 $\frac{1}{4}$ seconds.

J. E. (Ted) Meredith of the University of Pennsylvania and J. Dismond of Chicago did the best work in the quarter-mile but failed to disturb the existing records. D. S. Caldwell of Cornell sprang a surprise at the intercollegiate games by equaling the record of 1 minute 53 $\frac{3}{4}$ seconds for the 880 yards. In relay racing the team of the New York A. C. established a new mark of 2 minutes 6 $\frac{3}{4}$ seconds for 1200 yards outdoors. The quartette consisted of F. P. McNally, D. A. Kuhn, V. Wilkie, and T. Lennon.

One of the most remarkable performances of the year was that of E. Beeson of the Olympic Club of San Francisco in the running high jump. He made a leap of 6 feet 7 $\frac{1}{4}$ inches. Of the hurdlers special mention should be made of F. W. Kelly of the University of Southern California who ran 60 yards over 3 feet 6 inch uprights in 8 seconds, 75 yards over the same obstacles in 9 $\frac{1}{4}$ seconds, and 120 yards in 15 seconds. J. J. Eller of the Irish-American A. C. lowered the 75-yard low hurdle mark to 9 seconds. H. B. Liverpool, a California schoolboy, led the way in javelin throwing by hurling the shaft 184 feet 9 $\frac{1}{2}$ inches.

In weight tossing Pat McDonald and Pat Ryan of the Irish-American A. C. and P. Donovan of the Pastime A. C. divided the honors. McDonald hurled the 18-pound shot 46 feet 2 $\frac{3}{4}$ inches, bettering the record by 9 inches; Ryan set the new mark of 36 feet 8 $\frac{1}{2}$ inches for the 28-pound weight, and Donovan lifted the 56-pound shot for height to 16 feet 11 inches, excelling all previous performances. Edward Renz of the Mohawk A. C., New York, showed up the best in walking and lays claim to all the records from 12 to 25 miles. His figures, however, have not as yet been officially recognized.

The senior outdoor championships of the A. A. U. were held at Baltimore, Md., September 11-12, the Irish-American A. C. of New York winning for the fifth successive year with a total of 62 points. The New York A. C. was second with 29 points. Other teams entered and their scores were: Chicago A. A., 25; Boston A. A., 24; Illinois A. C., 16; unattached, 14; Irish-American A. A., Boston, 5; Mohawk A. C., New York, 5; Meadowbrook A. C., Philadelphia, 5; Poly Prep School, Brooklyn, 5; Kaleva A. C., Brooklyn, 5; C. Y. M. C. A., Baltimore, 3; Long Island A. C., 2; Smart Set A. C., 2; Cleveland A. C., 2; Anchor A. C., Jersey City, 2; Trinity Club, Brooklyn, 1; Swedish-American A. C., New York, 1.

In the junior outdoor championships the New

York A. C. was victor, its score being 55. The Irish-American A. C. was second with 24 points and the Boston A. A. third with 20 points. The all-around championship was won by Avery Brundage of the Chicago A. A. with 6999 points. The senior indoor championships were won by the Irish-American A. C. (46) with the New York A. C. (32) second, and the Bronx Church House, New York (14) third. In the junior events the New York A. C. (25) finished first, the Irish-American A. C. (16) second, and Columbia University (15) third.

The thirty-ninth annual track and field meet of the I. C. A. A. A. was held in the Harvard Stadium, May 29-30. Cornell won the championship, scoring a total of 43 points. Pennsylvania was second with 31 and Michigan third with 29 $\frac{1}{2}$. The standing of the other colleges was: Dartmouth 23; Yale 22; California 18; Harvard 11; Princeton 7 $\frac{1}{2}$; Columbia 5; Penn. State 2; Brown 2; Johns Hopkins 1.

The University of Illinois for the second successive year won the annual games of the conference colleges held at Chicago, June 6, scoring 457 $\frac{1}{2}$ points. Leland Stanford Junior was second with 231 $\frac{1}{2}$ points and Chicago third with 201 $\frac{3}{4}$ points. Other scores were: Wisconsin 19 $\frac{1}{4}$; Denver 10; Colorado 7 $\frac{1}{2}$; California 6; Perdue 5 $\frac{1}{8}$; Ohio State 4 $\frac{3}{4}$; Minnesota 3; Iowa 2 $\frac{1}{2}$; Missouri 2; Drake 2; Kansas 2; Lake Forest 2; Oberlin 1 $\frac{1}{2}$; Nebraska 1 $\frac{1}{4}$. The winners of other intercollegiate meets were: New England, Dartmouth; New York State, Colgate; Middle States, Lafayette; Missouri Valley, Chicago.

The most important dual college meets resulted as follows: Cornell 44, Michigan 27; Brown 65, Amherst 60; Columbia 56 $\frac{1}{2}$, Navy 47 $\frac{1}{2}$; Cornell 74 $\frac{1}{10}$, Michigan 41 $\frac{9}{10}$; Lafayette 56 $\frac{1}{2}$, Lehigh 55 $\frac{1}{2}$; Cornell 75 $\frac{3}{4}$, Harvard 41 $\frac{3}{4}$; Yale 87 $\frac{3}{4}$, Princeton 16 $\frac{3}{4}$; Illinois 76 $\frac{1}{2}$, Wisconsin 49 $\frac{1}{2}$; Chicago 71 $\frac{1}{2}$, Northwestern 54 $\frac{1}{2}$; Williams 90 $\frac{1}{8}$, Amherst 35 $\frac{3}{8}$; Yale 66 $\frac{1}{2}$, Harvard 37 $\frac{1}{2}$; Cornell 71, Pennsylvania 46; Columbia 59, Syracuse 58; Illinois 70 $\frac{1}{2}$, Chicago 55 $\frac{1}{2}$.

The English championships were held at Stamford Bridge, July 3-4. W. R. Applegarth for the second successive year captured the 100- and 220-yard dashes, equaling the record of 21 $\frac{1}{4}$ seconds in the last named event. Homer Baker of the New York A. C., as mentioned before, won the 880 yards. W. M. Oler, Jr., of the New York A. C. captured the high jump. England, Scotland, and Ireland took part in a triangular meet at Glasgow, July 11. England won with a total of six points. Scotland was second with three points. Ireland scored one point. The Oxford-Cambridge dual meeting was won by Cambridge which tallied seven points as against Oxford's four. Jean Bouin, the French distance runner, lost his life on the battlefield shortly after the outbreak of the European war.

ATOMIC WEIGHT. See CHEMISTRY.

AUCKLAND ISLANDS. A dependency of New Zealand (q.v.).

AUDACIOUS H. M. S. See NAVAL PROGRESS.

AUSTRALIA, COMMONWEALTH OF. A self-governing dominion of the United Kingdom, composed of six original States and two Territories. The temporary seat of the Federal government is Melbourne; the permanent capital will be Canberra, founded 1913, in the Federal Capital

Territory, which lies within the State of New South Wales.

AREA AND POPULATION. By States and Territories are given in the table below the estimated area and the population according to the census of April 3, 1911, compared with the population as estimated Dec. 31, 1913:

	<i>Square miles</i>	<i>1911</i>	<i>1913</i>
New South Wales...	309,460	1,646,784	1,831,716
Victoria	87,884	1,315,551	1,412,119
Queensland	670,500	605,813	660,158
South Australia	380,070	408,558	440,047
Western Australia ..	975,920	282,114	320,649
Tasmania	26,215	191,211	201,675
Northern Territory..	528,620	8,310	8,673
Federal Capital Ter..	912	1,714	1,988
Commonwealth	2,974,581	4,455,005	4,872,023

The population is exclusive of full-blooded aborigines, whose numbers are estimated not to exceed 100,000, many of whom live in the unexplored interior. Full-blooded aborigines in the employ or within the settlements of whites were enumerated in 1911 and numbered 19,939. The average density of the population for the commonwealth in 1911 was 150 per 100 square miles; the greatest density being 1497 per 100 square miles in Victoria, and the least density being 29 per 100 square miles in Western Australia (excepting the Northern Territory, which had 0.6). The population having Australia for birthplace in 1911 numbered 3,667,672, New Zealand 31,868, the United Kingdom 590,722, other European countries 73,949, Asia 36,442, Africa 4958, America 11,278, Polynesia 3410, at sea 4238, unspecified 30,468. Chinese numbered 25,772 and Japanese 3576. Of the total population in 1911, males numbered 2,313,035 and females 2,141,970.

According to religions, the population was divided in 1911 as follows: 1,710,443 Church of England, 558,336 Presbyterians, 547,806 Methodists, 458,379 other Protestants, 921,425 Roman Catholics, 17,287 Jews. According to occupation, the population was divided as follows: 144,611 professional, 201,366 domestic, 286,687 commercial, 157,391 in transport and communications, 562,337 industrial, 586,148 primary producers, 23,055 of independent means, 2,449,986 dependent (2,441,047 dependent on natural guardians), 8587 supported by voluntary and State contributions, and 353 criminals under legal detention, and 43,424 unspecified.

The total increase of population in the commonwealth between the census of March 21, 1901, and that of April 3, 1911, was 681,204, of which 335,107 were males and 346,097 females; as compared with a total increase of 599,409 (273,889 males and 325,520 females) for the period from 1891 to 1901. The total marriages for the commonwealth in 1913 numbered 41,594, births 135,714, deaths 51,789. The total increase of population for the year was 277,620 (135,714 births, and 141,906 oversea arrivals); the total decrease was 138,920 (51,789 deaths, and 87,131 oversea departures).

The total metropolitan population in 1911 was 1,094,329, or 38.05 per cent of the total population. A feature of the distribution of population in Australia is the excessive tendency to accumulate in towns, especially the capital cities. The capital of New South Wales is Sydney, with a population in 1911 with suburbs (approximately the area within a 10-mile radius) of

629,503; capital of Victoria, Melbourne, with 588,971; of South Australia, Adelaide, with 189,646; of Queensland, Brisbane, with 139,480; of Tasmania, Hobart, with 39,937; of the Northern Territory, Darwin, with 958; of the Federal District, Canberra. Figures for the population of Australian towns and cities are confusing, because they often relate to different areas. A population figure may include the inhabitants of the town proper and of its suburbs, persons living within a 10-mile or sometimes a 5-mile radius; it may relate to the "locality," in which case no clearly defined boundaries exist, and the population given represents the number of persons who returned themselves as belonging to that locality; again, it may relate to the "local government area," or the district incorporated for municipal purposes and variously known in the several States as city, town, borough, municipality, and corporation. Thus, according to the census of 1911, the population of Sydney with suburbs was 629,503; the "locality" Sydney, 107,133; "the local government area" (city) Sydney, 112,021. The following figures show for other large places the 1911 population by locality and local government area respectively: Melbourne, Vict., 36,293 and 103,593; Melbourne, East, Vict., 46,016 and 46,190; Ballarat, Vict., 38,686 and 22,017; Richmond, Vict., 38,559 and 40,442; Fitzroy, Vict., 34,141 and 34,283; Sydney North, N. S. W., 32,764 and 34,646; Adelaide, S. A., 32,981 and 42,294; Brunswick, Vict., 32,201 and 32,215; Balmain, N. S. W., 31,961 and 32,038; Perth, W. A., 31,300 and 35,767; Broken Hill, N. S. W., 30,953 and 30,072; Hobart, Tas., 27,993 and 27,526; Carlton, Vict., 27,476, not a local government area; Newtown, N. S. W., 26,427 and 26,498; Marrickville, N. S. W., 25,993 and 30,653; Prahran, Vict., 25,489 and 45,367; St. Kilda, Vict., 25,449 and 25,334; Redfern, N. S. W., 24,275 and 24,427; Hawthorne, Vict., 24,353 and 24,450; Paddington, N. S. W., 24,150 and 24,317; Leichhardt, N. S. W., 24,137 and 24,254; Footscray, Vict., 21,933 and 24,254; Geelong, Vict., 21,630 and 13,618; Glebe, N. S. W., 21,444 and 21,943; Brisbane South, 21,332 and 34,478; Launceston, Tas., 20,937 and 20,754; Petersham, N. S. W., 20,407 and 21,712; Collingwood, Vict., 20,254 and 34,190; Waverly, N. S. W., 18,961 and 19,831; Bendigo, Vict., 17,883 and 28,539; Melbourne North, Vict., 17,750, not a local government area; Brisbane, Qld., 17,715 and 35,491.

The commonwealth acquired jurisdiction over the Northern Territory, Jan. 1, 1911, over Papua (q.v.) in 1905. The Federal Capital Territory (including a small area at Jervis Bay) was taken over by the commonwealth from New South Wales Jan. 1, 1911. In 1913 the survey and other operations, including roads and engineering work for the new capital, Canberra, were in progress.

EDUCATION. The number of children over 6 and under 13 years of age receiving primary instruction in State schools was reported at 496,163, of whom 257,609 were boys and 238,554 girls; at private schools, 106,663, of whom 48,583 boys and 58,080 girls; at home, 17,151, of whom 7720 boys and 9431 girls. In addition there were 15,708 recorded as receiving instruction in schools whose class was not stated and 64,426 as receiving no stated instruction. Public instruction is under the control of each State, and is detailed as follows:

New South Wales. Education is nonsectarian, compulsory, and free, school fees in State, primary, and superior schools having been abolished in October, 1906. The total enrollment in 1913 in 3547 State schools was 269,937, and the average daily attendance 178,027. State expenditure on education, science, and art, £1,875,998. The University of Sydney, with which four colleges, including the Women's College, are affiliated, was incorporated in 1851. In addition to the State schools, there were 733 private colleges and schools in 1913, with 64,591 scholars; and 32 other schools, with 1942. In addition, there are special and technical institutions.

Victoria. Primary instruction is compulsory, secular, and free between the ages of 6 and 14. In 1913 there were enrolled 241,042 pupils, with an average daily attendance of about 63 per cent. Secondary education is largely under private control in 519 schools with 49,549 pupils. There is a State-aided university at Melbourne, with three affiliated colleges, and a school of mines at Ballarat.

South Australia. Primary education is compulsory, secular, and free, being provided by the State under control of a responsible minister. State schools numbered 815 in 1913, with 58,658 pupils. State expenditure, £237,629. There were 168 private schools, with 11,012 pupils. Secondary education is under private control. There is a university at Adelaide.

Queensland. Primary education is compulsory, secular, and free. There were 1359 State schools and 6 high schools in 1913, with a total daily attendance of 79,955; and 153 private and grammar schools, with an average attendance of 15,518. A State-aided university was established in 1910.

Tasmania. Primary instruction is compulsory, secular, and free. State schools, 1913, 431, with an enrollment of 33,953. Secondary education is provided for in State and private establishments. There is a university at Hobart.

Western Australia. Primary instruction is compulsory and free, the elementary schools being under the control of the minister of education. State schools in 1912 numbered 549, with an enrollment of 38,667 and an average daily attendance of 32,959; private schools, 118, with 9766 and 8506.

Private schools include the schools not entirely under State control; hence the term "private," though popularly applied is in some degree a misnomer. The 1911 census returned only 2¼ per cent of the population 20 years of age and over as unable to read.

PRODUCTION AND INDUSTRY. The estimated values of the products of the commonwealth are given in the table below for comparative years:

	1910	1911	1912
Agricultural	£289,752,000	£288,774,000	£45,754,000
Pastoral	56,998,000	50,725,000	51,615,000
Dairying, etc.	17,887,000	19,107,000	20,280,000
Forests and Fisheries	4,789,000	5,728,000	6,432,000
Mining	23,215,000	23,480,000	25,629,000
Manufactures ..	45,598,000	50,767,000	57,022,000

Agriculture. The total land area of the commonwealth is estimated at 1,903,731,840 acres, of which 17,368,000 were under cultivation in 1912-13, compared with 16,842,000 in 1911-12. The following table shows area under main crops for two years (figures for corn are in each case

for the preceding year) with yield in bushels of wheat, oats, and corn, and in tons of hay and sugar cane:

	Acres		Yield	
	1912-13	1913-14	1912-13	1913-14
Wheat ..	7,340,000	9,295,256	91,981,000	103,517,725
Oats	874,000	859,545	16,116,000	15,238,932
Corn	315,000	336,975	8,356,000	9,077,662
Hay	3,217,000	2,756,105	3,955,000	3,374,052
S. cane ..	155,000	160,976	1,185,000	2,271,558

In New South Wales, 4,568,818 acres were under cultivation and produced for the year ending March 1, 1913, 28,020,381 bushels of wheat, 4,359,000 bushels of corn, 1,835,406 of oats, 185,970 tons of sugar cane, 95,706 tons of potatoes, 18,117 cwt. of tobacco, and 1,154,000 bushels of citrous fruits. Land alienated and in process of alienation June 30, 1913, 57,107,976 acres; land leased for pastoral occupation and homestead, mining, and other purposes, 124,354,945 acres.

In Victoria, 6,129,893 acres were under cultivation in 1913-14, of which 2,565,961 were under wheat, 442,060 under oats, and 977,684 under grasses. The area returned under cultivation in 1912-13 was 5,707,000 acres, of which 2,085,000 were devoted to wheat, producing 26,223,000 bushels; oats, 439,000 acres and 8,324,000 bushels; barley, 72,000 acres and 1,745,000 bushels; potatoes, 48,000 acres and 191,000 tons; hay, 1,204,000 acres and 1,573,000 tons.

In South Australia, about two-thirds of the total area is farm and grazing lands. In 1913-14, 4,769,500 acres were under cultivation, of which 2,267,851 acres were under wheat, producing 16,938,988 bushels; 568,550 acres under grasses, 116,732 under oats, 90,552 under barley, 10,809 under potatoes; fallow, 1,569,623 acres.

In Queensland the government has parted with the fee simple of 16,041,764 acres; under a system of deferred payment, 10,039,255 acres additional are in process of alienation; 228,873,480 acres have been leased for sheep and cattle runs, 52,251,784 for grazing farms and homesteads; 40,535,160 acres are held under occupation license, 310,966 under gold mining and mineral lease, 107,707 for special purposes, and 42,363 acres for special lease. Wheat was grown on 42,962 acres in 1911-12, yielding 285,109 bushels; corn on 153,916 acres, yielding 3,637,662 bushels; oats on 557 acres yielding 5783 bushels.

In Tasmania March 1, 1913, 264,100 acres were under crops and 1,621,096 under sown grasses; under wheat, 18,432 acres. Leased for pastoral purposes from the crown, 1,621,096 acres. Wheat was grown in 1911-12 on 37,208 acres, yielding 659,615 bushels; oats, 57,583 acres and 1,504,633 bushels.

In Western Australia 1,547,800 acres were under crops in 1913-14, of which 1,104,753 acres were under wheat. In 1911-12, 612,104 acres were under wheat, yielding 4,358,904 bushels; oats, 77,488 acres and 961,385 bushels.

Live Stock. The number of animals in the country for comparative years is shown in the table below:

	1911	1912	1913
Sheep	93,003,300	84,000,000	85,046,724
Cattle	11,828,000	11,658,000	11,493,167
Horses	2,279,000	2,399,000	2,522,178
Swine	1,110,000	844,000	800,867

In 1913 the commonwealth produced 648,852,000 pounds of wool, stated as in the grease, against 728,409,000 pounds in 1912, and 721,298,000 pounds in 1911. Output of butter 1913, 198,648,000 pounds, against 211,574,000 pounds in 1912; cheese, 19,360,000 pounds, against 16,147,000; bacon and hams, 52,179,000 pounds, against 54,370,000.

In New South Wales sheep are raised in great numbers. There were, Dec. 31, 1913, in the State, 39,851,723 sheep, 746,075 horses, 822,667 dairy cows, 2,000,073 other cattle, and 288,090 swine. The production of wool, stated as in the grease, in 1912, was 326,804,000 pounds, valued at £12,823,000. Butter production in 1913, 77,687,241 pounds; cheese 6,479,496 pounds; bacon and hams 15,192,263 pounds.

Victoria contained, 1913, 656,090 milch cows with a total production for the year of 73,381,567 pounds of butter and 4,856,321 pounds of cheese; other cattle, 872,473; sheep, 12,113,682; swine, 221,277; horses, 562,331.

South Australia had, 1913, 5,073,057 sheep, 352,905 cattle, 283,641 horses, 64,119 swine, and 9,534 goats. Wool produced for export in 1913, 48,035,906 pounds, valued at £1,809,517.

Queensland possessed, in 1913, 5,322,033 cattle, 21,786,600 sheep, 707,265 horses, and 140,045 swine.

Tasmania had, 1913, 1,745,356 sheep, 205,743 cattle, 37,990 swine, and 43,941 horses. The 1913 wool clip was estimated at 8,871,669 pounds.

The live stock in Western Australia included 4,418,402 sheep, 829,489 cattle, 155,831 horses, 47,756 swine, 27,431 goats.

Minerals. The value of the gold output for the commonwealth in 1913 was £9,376,573—£635,703 from New South Wales. The output of gold from Western Australia in 1912 was valued at £5,448,385; from Victoria, £2,039,464; Queensland, £1,477,979; New South Wales, £702,129; Tasmania, £161,300; South Australia, £28,000; Northern Territory, £22,871. Output of silver from Tasmania, £309,098; New South Wales, £251,652; Western Australia, £16,353 (domestic export); Queensland, £66,188; Victoria, £2200; South Australia, £326. Coal output from New South Wales, £3,660,015; Queensland, £328,264; Victoria, £259,321; Western Australia, £135,857; Tasmania, £24,568. Output of copper from Queensland, £1,698,280; New South Wales, £579,791; South Australia, £461,500; Tasmania, £440,444; Western Australia, £60,537; Northern Territory, £3998; Victoria, £2088 (1911). Zinc from New South Wales was valued for 1911 at £1,414,980; tin, £307,089; the record year for Australian gold production was 1903, with a total value of £16,294,684.

Manufactures. There were in the commonwealth in 1913, 15,550 industrial establishments, employing 337,162 work people and paying wages amounting to £33,585,000; value of plant and machinery, £35,919,000; value of raw materials employed, £96,409,000; value added by manufacture, £65,197,000. Total value of ultimate output for the year, £161,606,000. Of the total number of establishments, 14,455 in the commonwealth in 1911, 5039 were in New South Wales, employing 108,664 work people, with output valued at £54,340,011; 5116 in Victoria, with 111,948, £41,747,863; 1657 in Queensland, with 37,156 and £16,675,662; 1314 in South Australia, with 27,907 and £12,580,851; 710 in Western

Australia, with 15,799 and £5,311,086; 609 in Tasmania, with 10,289 and £3,525,087. Value of aggregate output, £133,186,560.

COMMERCE. In the table below are shown imports of merchandise, of coin and bullion, and total imports, exports of domestic produce, re-exports, and total exports, for three successive years:

	1910	1911	1912
Imps. mdse.....	£58,682,891	£64,997,907	£76,488,860
Imps. C. & B....	1,381,960	1,969,581	1,675,240
Total	£60,014,351	£66,967,488	£78,158,600
Exps. dom.*.....	71,836,195	76,205,210	75,961,568
Re-exports*	2,654,955	8,277,048	3,184,527
Total	£74,491,150	£79,482,258	£79,096,090

* Including bullion and specie.

The totals for 1913 were £79,749,653 imports and £78,523,769 exports.

In the following table are shown total imports and total exports for 1912 and 1913. The value of goods transferred from one State to another for transshipment overseas is included in the exports of the State from which the goods are finally dispatched.

	Imports		Exports	
	1912	1913	1912	1913
	£	£	£	£
N. S. W.	32,803,124	32,850,663	32,958,529	32,889,789
Vict.	25,081,074	24,387,073	19,113,121	17,837,591
Qld.	7,456,917	6,714,942	9,209,454	12,852,748
S. A.	6,972,765	7,348,203	9,615,279	9,809,763
W. A.	5,817,392	5,407,714	7,640,707	5,102,240
Tas.	1,009,198	1,025,081	499,894	518,727
N. T.	18,180	20,977	59,106	67,911

In the table below the imports and exports in the 1912 and 1913 trade are detailed in pounds sterling.

	1912	1913
Imports		
Apparel and textiles.....	£18,155,000	£18,885,000
Metals and machinery	18,809,000	19,470,000
Drugs, chemicals, etc.	2,394,000	2,498,000
Timber	2,853,000	3,574,000
Paper and stationery	3,116,000	3,135,000
Bags and sacks	1,009,000	2,092,000
Oils (in bulk)	2,023,000	1,970,000
Sugar	1,191,000	929,000
Tea	1,824,000	1,811,000
Spirits	1,244,000	2,096,000
Arms, ammunition, etc.....	952,000	842,000
Tobacco	1,046,000	1,115,000
Exports		
Wool	£26,355,000	£26,277,000
Wheat	6,403,000	7,987,000
Skins and hides	4,290,000	5,546,000
Butter	8,843,000	3,181,000
Copper matte, ingots, and ore	8,811,000	2,972,000
Zinc concentrates	1,970,000	1,850,000
Tallow	1,550,000	2,168,000
Mutton and lamb	1,592,000	2,897,000
Flour	1,457,000	1,864,000
Timber	890,000	965,000
Coal	1,147,000	1,222,000
Lead (pig and matte)	1,818,000	1,848,000
Beef	1,631,000	2,652,000
Tin (ingots)	791,000	690,000

The direct export of wool, the produce of the State from New South Wales in 1912, was 271,871,731 pounds, valued at £11,496,850; other exports from this State were gold bullion and coin, £3,044,157; silver lead bullion, £482,489; coal and coke, £1,153,943; horses, £53,002; sheep, £18,018; cattle, £6516; hides and skins, £1,907,231; meats, £1,327,342; tallow, £668,036; leather, £345,919; butter, £1,076,851; wheat,

£1,619,107; copper, £2,310,322; tin, £646,225, etc.

The export overseas of domestic produce from Queensland were wool, valued at £4,275,520; gold, £74,538; tin, £141,957; live stock, £51,995; meats (exclusive of pork and pork products but including extracts), £2,033,001; hides and skins, £478,137; tallow, £466,916; copper, £577,241, etc.

From South Australia the wool export was valued at £2,032,383; bread stuffs, £3,245,199; meats, £197,601; fruits and wine, £134,662; hides and skins, £432,052; bullion and specie, £586,070, etc.

From Victoria wool and gold constitute nearly half of the total export. The export of wool in 1912 was 166,859,531 pounds, valued at £6,990,918.

From Western Australia the wool export in 1912, principally to London, was 27,901,770 pounds greasy, valued at £1,026,041, and 225,330 pounds scoured and washed, £9625. Export of wheat, £100,148; flour, £121,730; timber, £903,396; pearls and shells, £521,609; copper ingots and ore, £60,617; tin ingots and ore, £79,738; silver, £19,725, etc.

Cattle exported from the Northern Territory in 1910 were valued at £161,605; tin ore, £34,308; gold, £33,672; horses, £14,070; pearl shells, £10,030.

By principal countries of origin and destination the trade is detailed below in thousands of pounds sterling:

	Imports		Exports	
	1912	1913	1912	1913
United Kingdom..	45,925	47,615	81,459	84,805
Germany	5,145	4,956	7,441	6,873
United States ..	9,450	9,522	2,048	2,681
Belgium	2,146	2,258	6,585	7,465
France	574	625	8,022	9,684
New Zealand....	8,852	2,513	2,229	2,856
India	2,106	2,964	2,915	1,855
Ceylon	864	968	7,589	1,123
Japan	950	918	1,169	1,429
South Africa	295	127	1,488	1,941

Total shipping entered and cleared in the overseas trade for 1912, 4061 vessels, of 10,310,779 tons, compared with 4174 vessels, of 9,984,801 tons in 1911.

COMMUNICATIONS. Government railways in operation June 30, 1913, are shown in the table below: the first column relating to mileage, the second to cost of construction and equipment to end of June, 1912, the third to gross receipts, and the fourth to working expenses for the year ending June 30, 1913:

	Miles	Const.	Rev.	Expend.
N. S. W. 3,920	258,514,908	26,748,985	24,644,881	
Vict. .. 3,647	45,836,573	5,205,442	3,589,193	
Qld. ... 4,524	27,751,227	3,321,672	2,150,991	
S. A. ... 2,168	14,927,649	2,298,305	1,471,701	
W. A. ... 2,854	13,233,093	2,037,853	1,506,600	
Tas. ... 509	4,258,013	327,113	217,357	
N. T. ... 145	1,040,702	15,983	16,666	
Total 17,777	160,557,160	19,955,308	13,597,389	

In addition there were 1960 miles of private railways. In 1912 the building of the trans-Australian railway was begun; it is to have a total length of 1060 miles.

The Australian Railway War Council, provided for by Section 64 of the Australian local defense act of 1903, which was organized for the first time in February, 1911, was in session during

the year 1914. It was reported that the Council, which included the commissioners of all the State railways and the chief of the general staff, was discussing the uniform gauge question and the construction of new railways, which were strategically necessary. One such project was a strategic line between Adelaide and Brisbane which would reduce the railroad distance between the cities by one-half; the present route being via Melbourne and Sydney. The results were to be placed before a conference of the Federal and State commissioners at an early date.

On June 30, 1914 at the end of the fiscal year the Commissioner of Railways reported that there was an aggregate of 4700 miles of which 189 miles were opened to traffic during the year. At this time railway lines amounting to nearly 300 miles were under construction, and over 1400 miles had been authorized by Parliament, but had not yet been begun.

In November, 1914, it was reported that 231 miles of earthwork had been completed on the East to West Trans-continental Railway, which the Australian government is building between Port Augusta in South Australia and Kalgoortie in Western Australia. Tracks on these railways had been laid for 225 miles.

FINANCE. Revenue and expenditure of the commonwealth for four successive years are shown in the table below, together with the balance repayable to the State:

	Rev.	Expend.	Bal. rep.
1909-10	£15,540,669	£ 7,499,516	£8,041,153
1910-11	18,806,237	13,158,529	5,647,708
1911-12	20,548,520	14,724,097	5,824,423
1912-13	21,899,418	15,779,488	6,119,930

As estimated for 1913-14, the main sources of revenue and the principal items of expenditure were as follows:

Revenue	£	Expend.	£
Customs *	14,900,000	Repayments ..	6,315,000
Posts	4,548,000	Pensions	2,620,000
Land tax	1,400,000	Defense	3,085,870
Defense	85,000	Posts	5,189,265
Miscellaneous ..	579,000	Miscellaneous ..	4,802,365
Total	21,462,000	Total	21,462,000

* Including excise.

Revenue from customs and excise is collected by the commonwealth and partly repaid to the States at the rate of 25s. per head of the population.

The commonwealth has undertaken responsibility for the debts of the Northern Territory and the Port Augusta-Oodnadatta Railway, whose combined total is £5,671,847. The other State debts remain at the charge of the State governments. The total of these several debts amounted June 30, 1913, to £294,472,486.

Revenue, expenditure, and debt outstanding for the several States are shown in the table below for 1913-14:

	Rev.	Expend.	Debt.
N. S. W. ...	£18,298,591	£17,177,769	£106,170,747*
S. Australia..	4,822,766	4,604,129	38,564,832
Queensland..	6,978,259	6,962,516	52,164,086
Victoria† ..	10,287,285	10,258,081	62,776,724
Tasmania ..	1,238,085	1,162,514	12,265,012
W. Australia	5,205,343	5,840,754	34,420,181

* Debt 1912-13. † Revenue, expenditure and debt, 1912-18.

The aggregate sinking funds against total State debt in 1912 amounted to £5,701,767, so that the net debt in 1912 was £271,422,328, or £58, 10s. 3d. per capita. Of the total debt, 69.39 per cent was floated in London, and 30.65 per cent in Australia.

NAVY. The headquarters of the British fleet in Australia is at Sydney, a first-class naval station. In 1902 the agreement entered into by the commonwealth and imperial governments provided for a naval force to be maintained from 1903 until 1913 in Australasian waters by the British Board of Admiralty, in return for annual contributions from Australia of £200,000 and from New Zealand (a third party to the agreement) of £40,000. Out of this agreement has grown the "Australian defense scheme," whereby the commonwealth provides and maintains certain ships of war to form an Australian squadron of the royal navy, under command of a commonwealth officer in time of peace; in time of war it was to form an integral part of the eastern fleet.

The programme of naval construction adopted in 1911 by the commonwealth government covered a period of 22 years, and provided for a fleet of 8 battle cruisers, 10 protected cruisers, 18 destroyers, 12 submarines, and other craft. Serving in the royal navy at the end of 1913 were 1 battle cruiser—the *Australia*—4 protected cruisers, 3 destroyers, 2 torpedo boats, 2 gunboats, and 2 training ships. The *Australia* was launched at Clydebank, Oct. 25, 1911, and commissioned June 21, 1913; she has a displacement of 19,200 tons, and her main armament includes 8 12-inch guns and 16 4-inch guns; her indicated horsepower is 44,000 and her speed 28 knots. The light cruiser *Sydney*, built at Glasgow and commissioned in 1913, the *Brisbane*, completed 1914 at the navy yard at Sydney, and the *Melbourne*, launched at Glasgow, 1912, all have a displacement of 5400 tons, a main armament of 8 6-inch guns, 22,000 indicated horsepower, and a speed of 24½ knots. Under construction for the Australian navy at the navy yard of Sydney in 1914 were the destroyers *Swan*, *Derwent*, and *Torrens*, besides two submarines at the Vickers yard, Barrow.

GOVERNMENT. The government is that of a Federal commonwealth within the British Empire, the executive authority resting in the sovereign acting through a governor-general appointed by the sovereign. The governor-general is aided by a Federal executive council of seven ministers and certain honorary ministers. The Federal government possesses under the constitution limited and enumerated powers as surrendered by the federating States, including authority over commerce and navigation, finance, defense, posts and telegraphs, census and statistics, and conciliation and arbitration in extra-State industrial disputes, as well as power to assume control of railways and lighthouses, marriage and divorce, emigration and immigration, currency and banking, and weights and measures. The legislative authority is exercised by a Federal Parliament composed of a Senate of 36 members (six from each of the original States elected for six years by universal suffrage), and a House of Representatives similarly elected for a maximum of three years with members proportionate to the population with a minimum of five Representatives for each State. For the period 1913-16, the House was

composed of 27 members for New South Wales, 21 for Victoria, 10 for Queensland, 7 for South Australia, 5 for Tasmania, and 5 for Western Australia. Each State is administered by a governor, appointed by the crown and aided by a responsible council of ministers; and has a bicameral Parliament elected by universal adult suffrage. The Governor-General at the close of 1914 was the Rt. Hon. Ronald Cranford Munro-Ferguson, who succeeded Lord Denman in May, 1914. The Liberal ministry formed June 24, 1913, continued in power until September 18, 1914. It was constituted as follows: Prime Minister and Minister for Home Affairs, Joseph Cook; Treasurer, Sir. J. Forrest; Attorney-General, W. H. Irvine; Minister for External Affairs, P. M. Glynn; Minister for Trade and Customs, L. E. Groom; Postmaster-General, A. Wynne; Vice-President of the Executive Council, J. H. McColl; Ministers without portfolio, W. H. Kelley and J. S. Clemons; Liberal leader in the Senate, E. D. Millen. The constitution of the new ministry is given below, under **HISTORY**, *The New Cabinet*.

HISTORY

THE DEADLOCK IN PARLIAMENT. One of the most remarkable passages in the history of parliamentary government was afforded by the attempt of Mr. Joseph Hume Cook to govern the Commonwealth of Australia with a majority of one in the lower house and a hostile majority in the Senate. Mr. Cook, as reference to the **NEW INTERNATIONAL YEAR BOOK** for 1913 will show, became Commonwealth premier on June 24, 1913, following a general election in which his party, the Liberal party, won a majority of one vote in the Commonwealth House of Commons; but the Labor party was so strongly preponderant in the Senate that Mr. Cook's Liberal government found itself in a very precarious position. The elaborate Liberal programme, outlined in the last **NEW INTERNATIONAL YEAR BOOK**, could hardly be imposed upon an unfriendly Senate while the House offered such slender support to the ministry; the defection of a single member in the House would overthrow the cabinet. Mr. Cook himself recognized that sooner or later a deadlock between the two houses of Parliament would have to be faced, and the sooner the better. He therefore made little or no attempt to carry out the capital measures of his programme. Two things, however, he did accomplish. In the first place, he came to an agreement with the State Governments of New South Wales, Victoria, and South Australia for the joint prosecution of an important irrigation project, namely, the construction of a vast storage dam at Cumberboona on the Upper Murray River, at the approximate cost of \$23,000,000. In the second place, after consultation with the various State Governments, he arrived at a solution of the banking problem, looking toward the removal of the present unfortunate competition between the banking enterprises of the individual States and the savings-bank branches of the Commonwealth Bank; according to his plan, which was submitted for the ratification of Parliament, the Commonwealth government was to surrender its savings-bank business immediately, while in return the States were gradually to turn over to the Commonwealth all of their other banking interests.

Perhaps a third act of Mr. Cook's government might also be mentioned, and that is his appointment of Federal commissioners to investigate the question of electoral reform and to examine the evidence of corrupt practices in the election of 1913. It seemed that the electoral rolls were in a lamentable state of confusion, carrying the names of thousands of ineligible, making possible a considerable amount of illegal plural voting, and even retaining the names of two thousand dead voters.

These measures attracted little attention, however, while public opinion was chiefly concerned with the perplexing problem of the Parliamentary deadlock. Would Mr. Cook simply call for new elections to the House of Commons, thus giving the Laborites an opportunity—if they could but gain one more seat—to overthrow his ministry? Would he engage in a protracted and painful struggle with the Opposition and endeavor to accomplish the impossible task of governing with a majority in only one house? Or would he deliberately bring about a deadlock between the House and the Senate, upon some particular issue, in order to avail himself of the clause in the constitution which provides that in case the Senate twice rejects a measure passed twice by the House—in an interval of not less than three months—both houses of Parliament may be dissolved and elections instituted by the Governor-General? That the Premier would follow this last-mentioned course, with the hope of securing the election of Liberal majorities in both Senate and House, could hardly be doubted after December, 1913, when two Bills passed by the House were rejected by the Senate. One was a Bill to prohibit the showing of preference to trade-unionists in appointments to the civil service; the other was a Bill to restore postal voting. When Parliament was convened for the spring session, on April 15, 1914, the Speech from the Throne indicated that these two measures would again be brought before the House, and made it clear that the government was bent on bringing the issue to a head. In the House, however, the Labor Opposition was determined to thwart Mr. Cook's plans and to obstruct his action in every way. A vote of no confidence, proposed by the Laborites, was so acrimoniously debated that not until May 6 was it finally defeated, and then only by the Speaker's casting his decisive vote in support of the ministry. By their obstructionist tactics the members of the Opposition goaded the government to desperation. Finally the whip of the Liberal party decided upon the desperate expedient of holding an unexpected all-night session to wear the Opposition out; upon the appointed night pillows and blankets were supplied to the ministerialists in the House of Commons and the deliberations were prolonged throughout the night. The Laborites, caught unprepared, and finding their seats both hard and chilly, attempted to purloin the pillows from sleepy Liberals. In this fashion a battle was provoked which resembled a schoolboy pillow-fight far more than a legislative deliberation. But at any rate the government won its point, for in the early morning, while two exhausted Laborites were absent, the Liberals were able to move the closure and secure the passage of the Government Preference Prohibition Bill. Perhaps the Labor leaders who so strenuously had striven to delay this Bill in the House expected that their fellow-Labor-

ites in the Senate would pursue the same policy of obstruction; if so, they were disappointed. For the Labor majority in the Senate immediately rejected the Bill, May 28. Thus the Preference Prohibition Bill, designed simply to purify the civil service, assumed capital importance as a test measure: the House had passed it twice and the Senate had twice rejected it. On this ground Mr. Cook was able to inform the Governor-General that a deadlock existed between the two houses of Parliament, and to request a double dissolution, under section 57 of the Constitution. Governor-General Munro-Ferguson immediately complied with the Premier's request, and it was announced that Parliament would be dissolved on July 20 in preparation for general elections to take place on September 5. The call for new elections was hailed by the Liberals with jubilation, since it offered them an opportunity to win majorities in both houses of Parliament. But the Opposition, and especially the Labor Senators, gave evidence of more than a little irritation, and prepared two addresses to the Crown (i.e. to the Governor-General). The first address called for the publication of the correspondence which had passed between the Governor and his ministers relative to the dissolution; in effect such a demand was tantamount to censuring the Governor for granting the dissolution. Although under a plain interpretation of the Constitution the action of Munro-Ferguson would appear to have been perfectly legitimate, his Laborite critics pointed to the precedent set by former Governors-General in refusing to dissolve the Parliament when requested so to do by Sir George Reid in 1905 and by Mr. Fisher in 1909. The second address of the Senate Laborites asked the Governor-General to submit again in the coming elections the six referenda which were discussed in the last NEW INTERNATIONAL YEAR BOOK and which were defeated by narrow margins when voted upon in the elections of May, 1913. Both addresses were denied; the correspondence was not published, nor were the referenda submitted to the people. Temporary supplies were granted and then Parliament was dissolved.

THE SEPTEMBER ELECTIONS. Both parties entered the electoral campaign with unusual enthusiasm and confident expectation of victory. Mr. Cook, for the Liberals, in a series of vigorous speeches, declared that the chief issue of the contest was the valiant fight of his party against the determination of tyrannous labor organizations to dominate Parliament; he denounced those legislators who would allow their action to be dictated by trade union councils, and pleaded for the independence of the nation's representatives. The minor planks in the Liberal or ministerial platform were: (1) an electoral reform which would establish the principle of proportional representation for the Senate and preferential voting for the House; (2) a scheme of national insurance; (3) the maintenance of a "White Australia" by the exclusion of colored immigrants; (4) the development of the local navy; (5) the erection of an Interstate Wages Board. On the other hand Mr. Fisher, speaking for Labor, (1) attacked the Government's policy of borrowing money for expenditure on defense; (2) demanded wider Federal powers for dealing with industrial unrest, trusts, and the high cost of living; (3) promised a State-owned steamship line and Atlantic cable; (4) called for

higher duties; (5) proposed the Swiss initiative-referendum system as a substitute for double dissolution in case of Parliamentary deadlocks; (6) recommended the creation of a Commonwealth Government Insurance Department; (7) pledged his party to provide for widows and orphans; (8) and declared war on cancer, consumption, and the red plague. In the midst of the campaign all Australia was suddenly plunged into a turmoil of excitement by the outbreak of the great war in Europe; and one might well have expected political feuds to be forgotten and the electoral campaign to be deprived of all interest by the war. Quite the reverse actually happened. In the elections of September 5 the polling was unusually heavy—in Victoria, for instance, fully 80 per cent of the qualified electors voted. The result was a sweeping victory for Labor, a triumph so complete that the Liberal minority in the Senate was almost wiped out and in the House the acquisition of nine new seats gave Labor a working majority. It meant a vindication of the right of labor organizations to interfere in politics, it indicated the continuance of social legislation, and it signified that, in all probability, the oft rejected six referenda would soon be passed, at last giving the Commonwealth Government the right to intervene effectively for the regulation of "big business" and for the protection of the laboring classes. No significance attaches, however, to the Labor victory in the matter of loyalty to the Empire, for as we shall presently see, the Labor leader was not a whit less loyal than Mr. Cook.

THE NEW CABINET. Bowing to defeat, Mr. Cook almost immediately handed in the resignations of his Liberal ministry, and the triumphant Laborites, now controlling ample majorities in both houses of Parliament, had the satisfaction of seeing their leader, Mr. Andrew Fisher, form a Labor ministry. As announced on September 18, the new Labor cabinet was constituted as follows: Prime Minister and Treasurer, Andrew Fisher (who had previously occupied the same office from April 29, 1910 to June, 1913); Attorney-General, W. M. Hughes; Defense, G. F. Pearce; Trade, Frank G. Tudor; External Affairs, John A. Arthur; Postmaster-General, William S. Spence (president of the Australian Workers' Union); Vice-President, Executive Council, A. Gardiner; Home Affairs, William O. Archibald (former leader of the South Australia Labor party); Honorary Ministers, Hugh Mahon, E. J. Russell, J. Jensen. The first four mentioned were members of the former Labor ministry which held office from 1910 to 1913.

In the extraordinary situation created by the war, the new government was not likely immediately to insist upon carrying its full programme into effect. For the time being the Government was expected simply to cope with the war situation. Consequently Mr. Fisher simply continued Mr. Cook's work of drilling troops for the war and of relieving misery and unemployment by pushing forward railway construction and other public works. His motto was "standing with the Empire to the last man and with the last penny."

AUSTRALIA AND IMPERIAL DEFENSE. That Australia was able to assist at all in the great war was due to the fact that for the past three or four years she had been preparing to bear

a worthy part, both by land and by sea, in case the Empire should be involved in a serious struggle. Universal military training, as provided by the defense act of 1910, had imparted some slight acquaintance with military methods to some 22,000 militiamen, in addition to 90,000 cadets then undergoing compulsory training, and about 55,000 skilled marksmen registered with rifle clubs. This enthusiastic enterprise was highly commended by General Sir Ian Hamilton, Inspector-General of the Overseas Forces, when in February and March of 1914 he reviewed the various divisions of Australia's citizen-soldiery; but along with his hearty commendation of what the Commonwealth had already achieved, Sir Ian delivered a vigorous exhortation to increased energy in the future. Australia, he said, was surrounded by a "ring of armed nations," some of whom were "looking in a formidable manner at Australia"; therefore Australia with redoubled activity should push forward her military preparations.

The citizens of the island commonwealth were no doubt proud of their land forces, but their patriotism was even more strikingly embodied and their hearts more truly wedded to the "Royal Australian Navy." Looking forward to the creation of a full Australian Fleet Unit, the Commonwealth had already constructed a battle cruiser (*Australia*), 4 protected cruisers, 3 destroyers, 2 torpedo boats, 2 gunboats, and 2 training ships; and while the colonists took great pleasure in their embryo navy, and enjoyed the consciousness that it was constantly cruising in Australian waters ready to repel any possible enemy, they were also quite emphatic in promising that, should war ever come, the Australian ships would be placed loyally at the disposal of the Imperial Government. It was therefore with surprise and pain that the Australians received the news in April that Mr. Churchill, First Lord of the Admiralty (i.e. Imperial Minister of the Navy) had proposed the contribution by the colonies of ships to form an Imperial flying squadron which would be at the disposal of the British Admiralty in times of peace and of war. Japan, as Britain's ally, would amply protect Australia. Mr. Millen, then Australian Minister of Defense, seized upon eight salient and disagreeable features of Mr. Churchill's speech: (1) it signalized the failure of the Admiralty to live up to the agreement of 1909; (2) in disregarding that agreement it destroyed the basis upon which Australia had built up its fleet unit at a cost of several millions of pounds; (3) the statement that battle cruisers were not needed in the Pacific was inconsistent with the view taken by the Admiralty in 1909, when it issued a memorandum emphasizing the necessity of a complete fleet unit in the Pacific, whereof "the armored cruiser is an essential part"; (4) it would replace a definite coöperative policy of naval defense in the Pacific by an uncoördinated and ephemeral scheme without permanence and without clear aim; (5) it would substitute ineffective and isolated units for a powerful joint Imperial fleet in the Pacific, by withdrawing the Australian battle cruisers; (6) it would place a new and unjustifiable reliance upon the Anglo-Japanese Alliance; (7) it ignored those "other considerations" which are so important from a wide Imperial point of view, and upon which the Admiralty laid such stress in 1909; and (8) without previously consulting or even notifying

the Dominions, Mr. Churchill had announced a vital departure from the policy agreed upon between the Dominion and Imperial Governments. While thus severely criticising Mr. Churchill's utterance, Mr. Millen ardently rushed to the defense of the Commonwealth's policy, and went on to affirm that if, as Mr. Churchill suggested, the Australian battle cruisers were incorporated into an Imperial squadron for operation in European waters, Australia would be spending two-thirds of her naval appropriation on vessels for service far away from Australia; and if such a blow were delivered to their pride in their local navy, the Australians would hardly devote themselves with such enthusiasm to the arduous task of training recruits for the navy or vote with such generosity appropriations for naval expenditure. Most of all Mr. Millen resented the fickleness of the British Government: "Almost before the foundation of the policy inaugurated five years ago is laid, we are urged to adopt modifications so radical as to amount virtually to abandonment. In these circumstances there is little room for surprise if the simple faith with which Australia accepted the Admiralty as its guide on the former occasion should now give place to hesitancy and amazement at Mr. Churchill's pronouncement. . . . Australia is irrevocably pledged, and will pursue her determination to a consistency in the policy on which she embarked on the advice of the Imperial Government five years ago. She will not be deflected from her course by the pronouncement of the First Lord of the Admiralty, for she regards the task she has undertaken as vital to the cause of Imperial defense and Imperial union, and as the essential safeguard for her own protection." Subsequent declarations of Mr. Millen, on Empire Day (May 25) and in June, only served to strengthen the impression that although Australia was loyal, she was determined to be loyal in her own way—by maintaining her local navy. It was while the colony and the mother country were thus unhappily in disagreement, that the war came, and with it an opportunity for Australians to prove the loyalty of their hearts and the prowess of their warships.

AUSTRALIA IN THE WAR. From the very first hint of the possibility of a general European war, public opinion in Australia was keenly alive to the situation and enthusiastically patriotic. As early as July 31, Mr. Cook, then Premier, declared "All Australian resources are for the Empire's preservation and security"; the Melbourne *Argus* made bold to promise that "Our fleet is available if required"; and the Perth *Daily News* remarked that "In time of grave danger we consider the Dominions should strain every nerve to give every penny and send every man to assist the Motherland." That was four days before Great Britain engaged in the War of the Nations. When on August 4 war was at last declared, Australia was swept by an outburst of tremendous enthusiasm. The Government had already begun to make plans for placing an expeditionary force, together with the Royal Australian Navy, at the disposal of the Empire. Now the volunteering began for an expeditionary force of 20,000, and the recruits were sent for a few weeks to a training camp under the charge of Brig.-Gen. W. T. Bridges. These 20,000 volunteers, constituting a complete infantry division and a light horse brigade, were not enough for Australia to contribute to the

British cause; for presently the Premier announced that a further contingent of 10,000 would be sent to the front. Meanwhile contributions came pouring in—several millions of dollars were subscribed, horses and supplies were generously donated by private individuals. Most astonishing reports bore testimony to the fact that hundreds of German-Australians soon after the outbreak of the war took the trouble to become naturalized Australian citizens and pledged their support against their one-time Fatherland. All these circumstances bespoke a truly remarkable patriotic solidarity in the Commonwealth. As the Governor-General expressed it, "Australia speaks with one voice, and stands shoulder to shoulder with the other Dominions in defense of the Empire." The replacement of a Liberal ministry by a Labor ministry in September made little difference in this respect; it simply meant that Laborites instead of Liberals would carry forward the work of providing soldiers and funds, of using the public works to give relief to the industrial depression caused by the war, and of offering every assistance to the mother country. On questions of internal policy, however, partisan strife was continued, and with rancor, too, if one may judge from the report in December that Joseph Hume Cook, the Liberal leader, had been reprimanded by the speaker for insults to the chair during a debate on the Commonwealth Bank, and had angrily walked out of the house with all his followers.

OTHER EVENTS. On account of his feeble health, Lord Denman was replaced as Governor-General of Australia by the Rt. Hon. Ronald Cranford Munro-Ferguson, in May, 1914. The new incumbent of the office was a Scotch landowner, a man over fifty years of age, a strong advocate of Home Rule for Ireland; he had been active in British political life and had once served as Liberal Whip under Lord Rosebery, but was entirely deficient in colonial experience. Nevertheless his nomination was well received and his arrival heartily welcomed in Australia. Another event worthy of mention was the conference at Melbourne late in March of the State Premiers; the conference unanimously ratified Earl Grey's scheme for a Dominion House in London, rejected a resolution directed against the appointment of governors from the mother country, referred the question of railway gauges to a commission, and rejected the proposal of Mr. Holman (Premier of New South Wales) to centralize industrial arbitration in the Federal Arbitration Court. It is also interesting to note two events which cast light on the attitude of Australia toward the Irish Home Rule question which agitated the whole Empire during the spring and early summer. On May 4 a monster meeting at Melbourne, attended by over 25,000 persons, expressed its approval of Mr. Asquith's policy. On June 25 the Commonwealth Senate passed a resolution in favor of Irish Home Rule. There were, it is true, some Australians who sided with Ulster; but it was wholly natural that the preponderance of public sentiment should favor the extension to Ireland of the same rights of local self-government which in Australia conduced to such happy results.

For the local affairs of the individual States which compose the Australian Commonwealth, see separate articles on NEW SOUTH WALES, VICTORIA, QUEENSLAND, SOUTH AUSTRALIA, WESTERN AUSTRALIA, and TASMANIA. For detailed

information regarding the part taken by Australia in the great war, consult the article on the WAR OF THE NATIONS.

AUSTRIA-HUNGARY, or THE AUSTRO-HUNGARIAN MONARCHY. A monarchy of central Europe, consisting of the Austrian empire, the Hungarian kingdom, and the territory of Bosnia and the Herzegovina. Vienna is the capital of Austria, and Budapest of Hungary. In these cities the common legislature (the delegations) convenes alternately. Vienna is the permanent residence of the sovereign.

AREA AND POPULATION. The table below shows the area and population of Austria by crownlands, of Hungary proper by divisions, of Croatia and Slavonia, of Bosnia, and of the Herzegovina. The population figures for Austria and the Hungarian kingdom are according to the censuses of Dec. 31, 1900, and Dec. 31, 1910. For Bosnia and the Herzegovina, the population figures are according to the censuses of April 22, 1895, and Oct. 10, 1910, and hence the totals given for the monarchy cannot be quite exact. As Bosnia and the Herzegovina were not annexed until 1908, the population of the monarchy as constituted in 1900 was 45,405,267.

Of the inhabitants of Austria in 1910, males numbered 14,034,022 and females, 14,537,912; Hungary proper, 9,062,935 and 9,201,598; Croatia and Slavonia, 1,282,398 and 1,339,556 (Hungarian kingdom, 10,345,333 and 10,541,154); Bosnia and the Herzegovina (exclusive of the military to the number of 33,758), 994,852 and 903,192; total, 25,374,207 and 25,982,258.

The 1910 census disclosed in Austria 151 towns and cities with over 10,000 inhabitants; there were seven cities with over 100,000. In Hungary proper, there were 85 towns and cities with over 10,000 inhabitants, and two with over 100,000; in Croatia and Slavonia, seven towns and cities with over 10,000. Population of the larger Austrian towns and cities, Dec. 31, 1910: Vienna, 2,031,498; Prague, 223,741; Lemberg,

206,113; Trieste, 160,993 (with district, 229,510); Cracow, 154,141 (including 2255 inhabitants of Plasów, annexed in 1912); Graz, 151,781; Brünn, 125,737; Czernowitz, 87,113; Pilsen, 80,445; Königliche Weinberge (Vinohradý Královské), 77,120; Zitzkow, 72,173; Pola, 58,562; Linz, 67,817; Przemyśl, 54,078; Innsbruck, 53,194; Smichow, 51,791; Budweis, 44,538; Kolomea, 42,676; Laibach, 41,727; Aussig (Ústí nad Labem), 39,301; Mährisch Ostrau, 36,754; Tarnów, 36,731; Reichenberg, 36,350; Salzburg, 36,188; Drohobycz, 34,665; Tarnopol, 33,871; Stanisław, 33,328; Wiener-Neustadt, 32,874; Prossnitz, 31,462; Götz, 30,995; Strýj, 30,895; Troppau, 30,762; Trient, 30,049; Gablonz an der Neisse, 29,521; Klagenfurt, 28,911; Marburg, 27,994; Teplitz-Schönau, 26,777; Eger, 26,619; Igla, 25,914; Brúx, 25,577; Neusandez, 25,004. Population of the larger towns and cities of Hungary (including Croatia and Slavonia), Dec. 31, 1910: Budapest, 880,371; Szeged, 118,328; Szabadka (Maria-Theresiopel), 94,610; Debreczen, 92,729; Zágráb (Agram), 79,038; Pozsony (Pressburg), 78,223; Temesvár, 72,555; Kecskemét, 66,834; Nagy-Várád (Grosswardein), 64,169; Arad, 63,166; Hódmező-Vásárhely, 62,445; Kolozsvár (Klausenburg), 60,808; Újpest (Neupest), 55,197; Miskolcz, 51,459; Pécs (Fünfkirchen), 49,822; Fiume, 49,806; Győr (Raab), 44,300; Kassa (Kaschau), 44,211; Brassó (Kronstadt), 41,056; Nyíregyháza, 38,198; Székesfehérvár (Stuhlweissenburg), 36,825; Kiskunfélegyháza, 34,924; Makó, 34,918; Szatmárnémeti, 34,892; Cegléd, 33,942; Sopron (Oedenburg), 33,932; Újvidék (Neusatz), 33,590; Nagyszében (Hermannstadt), 33,489; Szentes, 31,593; Eszék (Esseg, Osjek), 31,388; Szombathely (Steinamanger), 30,947; Zombor, 30,593; Jászberény, 28,675; Zenta, 29,666; Szolnok, 28,778; Nagykőrös, 28,575; Hajdúböszörmény, 28,159; Eger (Erlau), 28,052; Versecz (Werschetz), 27,370; Nagykikinda, 26,795; Nagybecskerek, 26,006; Mezőtúr, 25,835; Maros-Vásárhely, 25,517. Sarajevo, the chief town of Bosnia, had, in 1910, 51,919 inhabitants, and Mostar, in the Herzegovina, 16,392.

The movement of the population is reported as follows (births and deaths each including stillbirths):

		Marriages	Births	Deaths
Austria1910	214,970	923,545	602,046
1911	217,878	898,702	628,305
1910	179,537	758,566	506,856
Hungary1911	193,482	747,916	539,645
1912	182,273	782,231	508,062
1910	20,651	77,348	52,010
Bosnia-Herz.1911	20,768	76,911	49,840
1912	16,323	82,142	48,564

Rate per thousand inhabitants of marriages (M), living births (B), total deaths (D), and stillbirths (S):

		M	B	D	S

Emigration of Austro-Hungarian subjects in 1908, 101,275 (of whom 52,214 from Austria); in 1909, 272,266 (143,532); in 1910, 278,240

(148,638); in 1911, 160,751 (90,134); in 1912, 246,300 (131,227).

EDUCATION. Elementary instruction in both Austria and Hungary is free and compulsory. At the end of 1910 and 1911 respectively, elementary schools numbered 23,847 (including 1208 private schools) and 24,226 (1261); teachers, 108,006 and 110,607; pupils, 4,520,138 and 4,533,734; children of school age, 4,818,870 and 4,885,504; training colleges, 142 and 148. In 1911, elementary schools in which German was the language used numbered 9180; Czech, 6033; other Slav languages, 7809; Italian, 738; Rumanian, 179; Magyar, 5; other languages, 4; more than one language, 278. In 1913 there were 343 gymnasia, with 108,838 students, and 148 realschulen, with 49,151. Besides many technical, professional, and special schools, there are 8 government technical high schools. In the winter semester of 1913-14, teachers and students respectively at these technical high schools were as follows: Vienna, 183 and 3177; Graz, 54 and 817; Prague (German), 86 and 900; Prague (Bohemian), 151 and 2817; Brünn (German), 102 and 924; Brünn (Bohemian), 73 and 569; Lemberg, 98 and 1791; Vienna agricultural high school, 86 and 1135. There are 8 universities maintained by the State; teachers and students in the winter semester of 1913-14: Vienna (German), 666 and 10,310; Prague (German), 225 and 2282; Prague (Bohemian), 249 and 4713; Graz (German), 199 and 2203; Cracow (Polish), 195 and 3344; Lemberg (Polish), 186 and 5871; Innsbruck (German), 139 and 1480; Czernowitz (German), 61 and 1194. Of the total university students, 2701 were women.

In Hungary, the elementary schools, grammar schools, and repetition courses comprise the "primary" schools. These schools in 1912 numbered 19,521, with 49,150 teachers and 2,969,444 pupils. The number of children of school age was 3,548,365. There were 96 training colleges, with 1229 teachers and 10,340 students. Gymnasia in 1912 numbered 192, with 371 teachers and 66,863 students; realschulen, 43, with 1044 teachers and 14,938 students. There are many special and professional institutions. Five universities are maintained by the State: Budapest, with 412 teachers and 6962 students in 1912; Zágráb (Agram), 97 and 1096; Kolozsvár (Klausenburg), 137 and 2157; and founded in 1912, Pozsony (Pressburg) and Debreczen.

AGRICULTURE. Austria-Hungary is one of the leading agricultural countries of Europe. Its crops include all the common European products and various subtropical fruits and plants. The distribution of land in 1910 is stated as follows, in hectares:

	Austria		Hungary	
	Ha.	Per cent	Ha.	Per cent
Arable land	10,641,996	35.37	13,916,061	42.82
Gardens	377,965	1.26	427,492	1.32
Vineyards	223,077	0.74	809,813	0.95
Meadows	3,191,686	9.82
Pastures, etc.	7,171,779	23.90	8,977,022	12.24
Woodland	9,788,080	32.63	8,906,505	27.41
Lakes, marsh, etc.	105,024	0.35	66,254	0.20
Unproductive (untaxed)	1,692,872	5.63	1,701,604	5.24
Total	30,000,793	100.00	32,496,487	100.00

The leading products include cereals, potatoes, and other vegetables, sugar beets, fruits, flax, hops (in Bohemia), tobacco (especially in Hungary, and hay. Area (in hectares) and yield (in metric quintals) of some of the important crops:

	Hectares		Quintals

Barley	52,800	422,400

Live stock has been reported as follows, in Austria (1910), in Hungary (1911), and in Bosnia and the Herzegovina (1911): horses, 1,802,848, 2,350,647, and 221,981; cattle, 9,160,009, 7,318,088, and 1,309,922; sheep, 2,428,101, 8,547,042, and 2,499,422; goats, 1,256,778, 426,975, and 1,393,068; swine, 6,432,080, 7,578,690, and 527,271. Live stock as reported for Hungary in 1913: horses, 2,005,019; mules and asses, 17,062; cattle, 6,206,867 (including 161,683 buffaloes); sheep, 6,659,858; goats, 268,986; swine, 6,824,657.

MINING AND METALS. In Austria, the total reported value of mining products (exclusive of salt, petroleum, etc.) increased from 317,833,337 kronen in 1908 to 320,107,395 in 1911 and 352,545,531 in 1912; furnace products increased in value from 136,920,722 kronen in 1908 to 155,669,112 in 1911 and 179,212,612 in 1912. The quantity and value of the more important minerals produced in 1912 were as follows: coal, 15,797,890 metric tons, 162,600,458 kronen; lignite, 26,283,690 tons, 141,045,962 kr.; iron ore, 2,926,686 tons, 27,364,903 kr.; lead ore, 27,952 tons, 6,567,943 kr.; silver ore, 21,794 tons, 4,076,705 kr.; zinc ore, 34,675 tons, 2,887,256 kr.; mercury ore, 117,780 tons, 2,882,630 kr.; graphite, 45,375 tons, 1,869,998 kr.; copper ore, 17,354 tons, 1,668,525 kr.; gold ore, 603,840 kr. The metal production in 1912 included: raw iron, 1,759,851 metric tons, valued at 143,893,646 kr.; zinc, 17,298 tons, 10,555,550 kr.; lead, 19,993 tons, 9,521,889 kr.; silver, 49,355 kilos, 4,905,366 kr.; copper 3057 tons, 4,613,740 kr.; mercury, 763 tons, 3,972,912 kr.; gold, 204 kilos, 662,775 kr. The output of petroleum (and ozocerite) in Galicia declined from 2,088,457 metric tons in 1909 to 1,768,189 in 1910 and 1,489,782 in 1911 (1,487,842 tons petroleum, 1940 tons ozocerite); the 1911 output was valued at 46,994,393 kr. for petroleum and 2,614,472 kr. for ozocerite.

In Hungary the value of the coal output in 1911 was 15,481,000 kr., and in 1912, 16,904,000 kr.; lignite, 77,200,000 and 80,697,000; iron ore, 13,334,000 and 15,379,000; raw iron, 43,848,000 and 46,447,000; silver, 907,000 and 1,023,000; gold, 10,468,000 and 9,354,000.

COMMERCE. The tables below show, in thousands of kronen, the trade of the common customs territory. Imports of merchandise for home consumption, of total merchandise, of coin and bullion, and the total imports:

	Mdse. Home Consump.	Total Mdse.	Coin and Bullion	Total Imports
1902	1,720,335	1,770,281	166,034	1,936,315
1907	2,501,974	2,587,147	43,839	2,630,986
1911	3,191,711	3,275,208	41,414	3,316,622
1912	3,556,797	3,669,882	19,827	3,689,709

Exports of domestic merchandise, of total merchandise, of coin and bullion, and the total exports, in thousands of kronen:

	Domestic Mdse.	Total Mdse.	Coin and Bullion	Total Exports
1902	1,913,598	1,999,396	82,007	2,081,403
1907	2,457,286	2,658,085	79,456	2,737,541
1911	2,404,304	2,582,560	182,915	2,715,475
1912	2,733,855	2,926,665	178,420	3,105,085

The more important imports of merchandise for consumption in 1912 and 1913 respectively were valued as follows, in thousands of kronen: raw cotton, 329,785 and 336,057; wool, 161,971 and 141,478; coal, coke, etc., 220,905 and 292,827; coffee, 102,020 and 93,390; corn, 105,682 and 83,806; tobacco, 61,987 and 46,560; eggs, 66,574 and 68,518; rice, 28,351 and 36,242; hides and skins, 102,254 and 115,571; silk and its manufactures, 123,144 and 114,408; flax, hemp, and jute, 89,935 and 85,910; machinery, 100,399 and 80,837. Leading exports of domestic produce in 1912 and 1913 respectively, in thousands of kronen: sugar, 254,076 and 292,880; sawn timber, 164,036 and 157,094; eggs, 144,152 and 137,372; rough timber, 92,073 and 90,399; lignite, 78,508 and 76,425; glass and glassware, 77,715 and 88,264; leather gloves and shoes, 54,050 and 60,628; malt, 66,143 and 55,697; woolen goods, 70,001 and 64,809; cattle, 36,457 and 44,122; hops, 49,697 and 38,826; beer (in casks), 16,252 and 18,817; horses, 32,206 and 15,489; bed feathers, 19,138 and 19,008; fowl, 16,177 and 15,960.

In 1912, in the special trade, the imports and exports of raw materials were valued at 2,006,124,000 and 961,320,000 kronen respectively; partially manufactured materials, 574,865,000 and 511,130,000; manufactures, 975,808,000 and 1,261,405,000; total, 3,556,797,000 and 2,733,855.

The special trade in merchandise by principal countries, in thousands of kronen:

	Imports		Exports

Total including other. 3,191,711 3,556,797 2,404,304 2,733,855

SHIPPING. Vessels entered at Austrian sea-ports in 1911, 167,483, of 24,836,706 tons; in

1912, 167,113, of 25,566,314 tons (of which 154,747, of 23,739,584 tons, Austro-Hungarian). Vessels cleared at Austrian seaports in 1911, 167,209 of 24,887,721 tons; in 1912, 167,122, of 25,569,882 tons (of which 154,787, of 23,741,146 tons, Austro-Hungarian). Vessels entered at Hungarian (including Croatian) ports in 1911, 25,021, of 3,815,463 tons; cleared, 24,981, of 3,802,816 tons.

COMMUNICATIONS. The length of railway in operation in the Monarchy, as reported for Jan. 1, 1913, was 47,037 kilometers (29,226 miles). Of the total, 23,200 km. were in Austria, 21,881 in Hungary, and 1956 in Bosnia and the Herzegovina. About seven-tenths of the Austrian lines and about four-fifths of the Hungarian are owned and operated by the State.

The length of telegraph line in Austria at the end of 1911 was 47,076 km., with 237,847 km. of wire and 7039 offices; thereof 40,577 km. of line, 40,577 km. of wire, and 4589 offices belonged to the State. In 1912, Hungary had 26,202 km. of telegraph line, 153,803 km. of wire, and 4765 offices. The length of telegraph line reported for Bosnia and the Herzegovina is 3269 km., and of wire 7526 km., the number of offices being 180. Reported length of telephone wire in Austria in 1911, 411,885 km.; in Hungary, 344,633 km.; in Bosnia and the Herzegovina, 1104 km. Post offices in Austria in 1911, 9666; in Hungary, 6489; in Bosnia and the Herzegovina, 185; in addition, there were 36 Austro-Hungarian post offices in foreign territory.

FINANCE. The monetary unit is the krone, whose par value is 20.263 cents. The cost of administering the common affairs of the monarchy is borne by the Government of Austria and by the Government of Hungary in a proportion agreed to by their parliaments and sanctioned by the sovereign. The agreement renewed for ten years in 1907 provides that the net proceeds of the common customs be applied to the common expenditure, and the remaining expenditure be satisfied by Austria in the proportion of 63.6 per cent and by Hungary 36.4 per cent. In 1909 the expenditure of the monarchy was 643,578,124 kronen (440,391,996 ordinary and 203,186,128 extraordinary); in 1910, 573,750,039 kr. (461,617,783 and 122,132,254). Net customs revenue in 1909, 197,979,735; in 1910, 228,451,954. Contribution of Austria in 1909, 283,400,575 kr.; in 1910, 219,609,773. Contributions of Hungary in 1909, 162,197,814 kr.; in 1910, 125,688,612. The budget for 1913 showed estimated ordinary expenditure of 497,950,169 kr.; extraordinary, 90,424,819; total, 594,374,988. The total estimated expenditure for 1913 was divided as follows: ministry of foreign affairs, 18,954,716 kr.; finance, 5,143,953; board of control, 363,540; army, 425,755,569; navy, 144,157,210.

In Austria, revenue and expenditure in 1910 amounted to 2,895,491,963 kr.; in 1911, 3,093,034,359 and 3,006,163,122. Estimated revenue for 1913, 3,137,481,539 kr. (2,943,804,420 kr. ordinary and 193,677,119 kr. extraordinary); estimated expenditure, 3,137,202,566 kr. (2,799,063,052 kr. ordinary and 338,139,514 kr. extraordinary). The larger estimated expenditures included: railways, 696,965,220 kr. ordinary and 143,759,000 kr. extraordinary; public debt, 509,681,469 and 641,167.

In Hungary, revenue and expenditure in 1910 amounted to 2,074,548,000 kr. and 1,901,666,000

kr. respectively; in 1911, 1,830,779,496 and 1,768,348,545. Estimated revenue for 1913, 2,072,809,031 kr. (1,834,299,156 kr. ordinary and 238,509,875 kr. extraordinary); estimated expenditure, 2,072,754,196 kr. (1,721,781,426 kr. ordinary), 106,928,930 transitory, and 244,043,840 for sinking fund. The larger items of estimated expenditure included: ministry of commerce, 484,472,250 kr.; finance, 273,822,068; Hungarian public debt, 226,137,396.

In Bosnia and the Herzegovina, the estimated revenue and expenditure for 1911 were 79,129,475 kr. and 79,535,715 kr. respectively.

No debts are contracted by the monarchy, in accordance with the terms under which the Union was effected in 1867. The total general debt, contracted before that time, amounted on Jan. 1, 1913, to 5,158,396,373 kr., of which 5,130,183,768 kr. formed the consolidated debt. On the same date, the Austrian debt was 7,312,753,129 kr., of which 6,965,111,048 kr. formed the consolidated debt. The Hungarian debt in 1911 stood at 6,390,863,683 kr.

ARMY. Austria-Hungary maintains a common army, whose composition is affected naturally by the existence of the dual monarchy, although in time of war it is organized to act as a common force. As in other countries of Europe engaged in the great European war, the strength and organization of the army of Austria-Hungary underwent considerable change and expansion in 1914. Previous to the outbreak of the war the peace establishment had been estimated at 425,000 men and the war basis 2,300,000 men. The army bill of 1912 served to add about 45,000 men by 1917 under normal conditions. Duke Franz Ferdinand, who was heir apparent to the throne, was assassinated on June 28, 1914, after he was appointed inspector-general of the Austro-Hungarian forces. At the beginning of 1914 the Austro-Hungarian army comprised 16 army corps of 33 infantry divisions and 76 brigades. There were eight cavalry divisions and in addition eight Austrian landwehr divisions, eight Hungarian infantry divisions, and two Hungarian cavalry landwehr divisions. At this time the exact peace strength was not available, and naturally there were no figures for the army as augmented on mobilization. It was estimated that 20 corps and 10 cavalry divisions could be put into the field. At the outbreak of the war an authoritative statement was published on the disposition of the Austro-Hungarian army by corps and was as follows:

The first army corps, with one cavalry division, at Cracow; second army corps, with one cavalry division, at Vienna; third army corps at Graz; fourth army corps, with one cavalry division, at Budapest; fifth army corps, with one cavalry division, at Pressburg; sixth army corps at Kraschau; seventh army corps, and one cavalry division, at Temesvar; eighth army corps at Prague; ninth army corps at Leitmeritz; tenth army corps, with one cavalry division, at Przemyśl; eleventh army corps, with two cavalry divisions, at Lemberg; twelfth army corps at Hermanstadt; thirteenth army corps at Agram; fourteenth army corps at Innsbruck; fifteenth army corps at Sarajevo; sixteenth army corps at Ragusa. To these must be added eight Austrian Landwehr infantry divisions, eight Hungarian Landwehr infantry divisions, and three Hungarian Landwehr cavalry divisions.

On the Servian and Montenegro frontiers from east to west were the following army corps: the twelfth (Hermanstadt), the seventh (Temesvar), the thirteenth (Agram), and in addition in Bosnia, Herzegovina, and Dalmatia are the fifteenth army corps (Serajevo) and the sixteenth (Ragusa). Behind these, between the seventh and thirteenth army corps, was the fourth army corps (Budapest).

Of military importance also was the Danube Flotilla, which consisted of monitors and patrol boats. The monitors were the *Temes* and the *Bodrop*, built in 1904, each with an armament 2 12 cm. q. f. guns, 1 12 cm. howitzer, and 2 8 mm. machine guns. The *Szamos* and the *Körös*, built in 1892, each armed with 2 12 cm. q. f. guns, 2 7 cm. q. f. guns, and 2 8 mm. machine guns. The *Maros* and the *Leitha*, built in 1871, each armed with 1 12 cm. q. f. gun, 2 47 mm. mitrailleuses, and 1 8 mm. machine gun. These monitors had a complement of about 3 officers and 70 men, and were armored. The guns had a range of 5 kilometers and the machine guns were for close fighting. To these 6 monitors must be added 7 patrol (motor) boats, each armed with 1 machine gun. This flotilla was especially built for service on the northern frontier of Servia.

In 1913 it was announced that two new landwehr regiments of lancers were to be raised and the establishments of the additional cavalry were to be increased. A bayonet for dismounted action was to be given the cavalry, and additional cyclist companies were to be raised, one company to be given to each cavalry division in case of war. In times of peace the cavalry in the Austro-Hungarian army served for three years with the colors, as in the German army. Austria-Hungary had profited by the artillery practice against aeroplanes, which had been carried on in 1913, and it was the opinion of artillery officers that the common shell would prove more effective owing to the sharp-edged splinters and the greater moral effect, and the effect of detonation. It was proposed to add two ammunition wagons with four guns to the field batteries in peace, and increase the strength of the field artillery regiments from 5 batteries to 6 with a substantial increase of the mountain artillery. The heavy artillery of the field army was modernized by the introduction of a new howitzer, the old form of which had been issued from 1899 to 1911, and this weapon was in effective use. While progress in the development of the artillery was slow, yet many trials of heavy and light field howitzers had been made, both on the march and at maneuvers, as well as in target practice. Previous to the outbreak of the war, the chief developments in the Austro-Hungarian army had been towards increasing the strength of the air craft and providing a large increase in machine guns. It was the opinion of military observers that the mobilization of the Austrian army was slow and that the forces were not put into the field as rapidly as they should have been.

NAVY. Number and displacement of warships of 1500 or more tons, and of torpedo craft of 50 or more tons, built and building, July 1, 1914: dreadnoughts (battleships having a main battery of all big guns, that is, 11 or more inches in calibre): built three, of 60,030 tons, building four, of 93,510 tons. Predreadnoughts (battleships of about 10,000 or more tons dis-

placement whose main batteries are of more than one calibre): built six, of 74,613 tons; building, none. Coast-defense vessels (including smaller battleships and monitors): built six, of 41,700 tons; building, none. Battle cruisers, none built or building. Armored cruisers: built two, of 13,380 tons; building, none. Cruisers (unarmored warships of 1500 or more tons): built five, of 13,815 tons; building five, of 21,216 tons. Torpedo-boat destroyers: built 18, of 9450 tons; building, none. Torpedo boats: built 39, of 6852 tons; building 24, of 5886 tons. Submarines: built six, of 1686 tons; building six, of 5370 tons. Total tonnage: built, 221,526; building, 125,982. Austria-Hungary stands eighth among the nations in amount of warship tonnage completed and also in the aggregate of tonnage built and building. In the figures given above, certain vessels are not included, viz.: ships over 20 years old from date of launch unless reconstructed and rearmed within five years; torpedo craft over 15 years old; transports, colliers, repair ships, torpedo-depot ships, and other auxiliaries; vessels not actually begun or ordered, although authorized. The following are the principal characteristics of the *Viribus Unitis*, one of the three dreadnoughts: designed speed, 21 knots; displacement, 20,010 tons; length between perpendiculars, 492 feet; beam, 89 feet; draft, 26 feet; complement, 1000; main battery, 12 12-inch guns; torpedo tubes, four; maximum thickness of armor belt, 11 inches; launched, June, 1911; completed, September, 1912. See BATTLESHIPS; NAVAL PROGRESS; and WAR OF THE NATIONS.

GOVERNMENT. The administration of the monarchy as a whole is directed by the Emperor-King, acting through three ministries (foreign affairs, finance, and war), who are responsible to the two delegations. These bodies, consisting of 60 members each, are elected by the Austrian and Hungarian parliaments respectively; they annually convene, alternately at Vienna and Budapest. They examine the requirements of the common services of the monarchy and advise the parliaments as to necessary appropriations. The common government deals with finance relating to the monarchy as a whole, foreign affairs, the diplomatic, postal, and telegraphic services, and certain State monopolies. Austria and Hungary have each a representative parliament of two houses and a responsible ministry. Each of the Austrian crownlands and Croatia and Slavonia have separate diets. Bosnia and the Herzegovina are administered under the (common) minister of finance.

The sovereign in 1914 was Franz Joseph I, who was born Aug. 18, 1830. He became Emperor of Austria Dec. 2, 1848, and King of Hungary June 8, 1867. The heir presumptive, Franz Ferdinand, nephew of the Emperor, was assassinated at Sarajevo, Bosnia, June 28, 1914. The new heir presumptive, son of the late Archduke Otho Franz Joseph and nephew of the Emperor, is Archduke Karl Franz Joseph, born Aug. 17, 1887.

The common ministry in 1914: Premier and Minister for Foreign Affairs, Stephan (Baron) Burian von Rajecz (appointed January, 1915); finance, Dr. Leon (Ritter) von Bilinski (appointed February, 1912); war, Gen. Alexander (Ritter) von Krobatin (appointed December, 1912). The navy department constitutes a section of the ministry of war; the commandant

in 1914 as Admiral Anton Haas (appointed February, 1913).

The Austrian ministry in 1914 (formed Nov. 3, 1911): Premier, Karl (Count) Stürgkh; Minister of the Interior, Dr. Karl (Baron) Heinold von Udyński; worship and public instruction, Dr. Max (Ritter) von Hussarek von Heinlein; finance, Aug. (Baron) Engel de Mainfelden; commerce, Dr. Rudolf Schuster (Edler) von Bonnot; railways, Dr. Zdenko (Baron) von Forster; agriculture, Dr. Franz Zenker; national defense, Gen. Friedrich (Baron) von Georgi; public works, Ottokar Trnka; justice, Dr. Viktor (Ritter) von Hohenburger; without portfolio, Dr. Ladislav von Dlugosz.

The Hungarian ministry in 1914: Premier and Minister of the Interior, Stepan (Count) Tisza; Minister of Finance, János Teleszky; commerce, János (Baron) Harkányi; agriculture, E. (Baron) Ghyllányi de Loz és Bernyecz; public instruction and worship, Dr. Jankovich de Jeazancize; justice, Dr. Eugen de Balogh; national defense, Lieut.-Field-Marshal Samuel (Baron) Hazai; Minister for Croatia and Slavonia, Dr. Theodor (Count) Pejácsevich de Borosjenő és Szeged.

HISTORY

THE AUSTRIAN REICHSRAT. In the lower chamber or *Abgeordnetenhaus* of the Austrian *Reichsrat* parliamentary activities were made practically impossible by the disorderly and obstructionist tactics of the Opposition. The German, Polish, Socialist, and Italian deputies, and most of the Czechs, for ordinary purposes would have formed a working majority and might have been able to proceed in a business-like manner; but the radical minority of the Czechs, the Ruthenes, and the representatives of the southern Slavs, acting under the stimulus of an intense nationalism, were willing and able to set at naught the desires of the majority. At the end of December, 1913, the Ruthenians, who had been most troublesome, consented for a time to abandon their obstruction in order that a few important bills might be considered. A bill was passed to raise the exemption on the income tax from 1200 kronen (\$240) to 1600 kronen (\$330). This reform was at first rejected by the upper chamber or *Herrenhaus*, and a deadlock between the two houses of the *Reichsrat* seemed inevitable. On Jan. 13, 1914, however, a joint conference of both houses was held, with the result that the increased exemption was allowed.

The month was not allowed to pass without a renewal of the obstruction in the Lower House, this time by the Czech minority. Hoping to arrive at an understanding with the Czechs, the Austrian government terminated the session of the *Reichsrat*, and called a series of conferences between German and Czech Bohemians. The quarrels between Germans and Czechs in Bohemia had led in 1913 to the dissolution of the Bohemian Provincial Diet, and the suspension of Bohemian autonomy. Since then, the Bohemian question has been particularly acute. The purpose of the conferences was to discover an acceptable compromise on the main points at issue: (1) whether administrative officials should use German, Czech, or both languages; (2) how the Provincial Diet should be elected; (3) in what manner Bohemia might be divided up into Czech districts and German districts;

(4) what should be the constitutional status of Bohemia. Unfortunately the Germans would not consent to the government's proposal to abolish the bilingual régime and to make Czech the official language in the city of Prague; and the Czechs were equally determined not to concede some of the fundamental contentions of the Germans. The conferences were doomed to failure from the start.

On March 5, the *Reichsrat* had been called together again, for the purpose of voting military and financial measures; but as the Czechs were clearly bent on resuming their obstructionist tactics in the *Abgeordnetenhaus*, Count Stürgkh decided to prorogue the *Reichsrat* on March 16. Neither budget nor army bill had been voted. In this emergency the cabinet availed itself of paragraph 14 of the constitution to promulgate for one year the law increasing the annual contingent of recruits for the army; and in place of the consolidated loan of \$100,000,000 which had been contemplated, the government issued Treasury Bills to provide for current expenses. The Austrian budget for 1914-15, as published on June 3, showed a total estimated expenditure of over \$700,000,000, and called for new loan issues amounting to about \$45,000,000. The death of Count Zaleski in December, 1913, left vacant the post of Finance Minister in the Austrian cabinet. Count Zaleski's successor was Baron Engel von Mainfelden.

HUNGARY. The Lower House of the Hungarian Parliament, like the Lower House of the Austrian *Reichsrat*, was frequently thrown into disorder by the efforts of a violent and irreconcilable Opposition; but in Hungary sterner measures were taken to prevent the Opposition from paralyzing the activities of Parliament. On Jan. 14, 1914, for example, after violent altercations in the Hungarian House of Representatives, Count Karolyi and other Opposition leaders were suspended and ordered to leave the hall. Upon their refusal, the Parliamentary Guard was called in to eject them by force. Within a fortnight of this occurrence, Count Julius Andrássy caused an uproar by insisting upon continuing a speech which the House did not wish to hear. Again the Parliamentary Guard was called in, Count Andrássy and Count Zichy were expelled from the hall, and the Opposition members walked out in a body. Then the remaining members proceeded quietly to pass a Press Law Reform Bill. The Army Bill was likewise passed only after the Opposition had been expelled. In February a 4½ per cent loan of about \$100,000,000 was issued by the Hungarian government to provide funds for the repayment of outstanding treasury bonds, for ordinary expenditures, and for the extension of the Hungarian State railways. The Budget debate in the Hungarian Parliament drew to a close on May 6, and a Finance Bill was then introduced, whereby a loan of 400,000,000 kronen (\$80,000,000) was to be floated for the payment of Hungary's share in the extraordinary joint naval and military expenditures of the Dual Monarchy, and for sundry other purposes.

After the outbreak of war, in the summer of 1914, a truce was arranged between the government and the Opposition, according to a Berlin dispatch; the various measures necessitated by the war were passed without disagreement; and Count Karolyi and Count Andrássy, the leaders of the Opposition, announced that they would

postpone criticism of the ministerial policy until peace should be restored. "The House sent greetings to the army in the field, and expressed admiration for the work accomplished and confidence in the ultimate achievement of a victory which would bring rich advantages to Hungary."

Francis Kossuth (q.v.), a notable figure in Hungarian politics, and the son of Louis Kossuth, died in Budapest on May 25, 1914.

THE DELEGATIONS. Owing to the serious illness of the aged Emperor, Archduke Francis Ferdinand (the heir apparent) represented the Crown at the opening session of the Austrian and Hungarian Delegations at Budapest on April 29. In the light of Austria-Hungary's subsequent declaration of war on Serbia, it is interesting to observe that Count Silva Taronca, president of the Austrian Delegation, called forth enthusiastic cheers when he demanded that a stop should be put to the "anti-Austrian propaganda carried on in our frontier districts." And there is a certain grim humor in the repeated affirmation of the solidarity of the Triple Alliance, as well as in Count Berchtold's praise of English diplomacy. At that time, however, Italy's defection from the Triple Alliance was not foreseen, and it was confidently believed that the bonds of the alliance had been drawn more closely than ever by the recent meeting of Count Berchtold with the Marquis di San Giuliano (Italian Foreign Minister) at Abbazia, and by the visits of the German Kaiser to Francis Joseph at Schönbrunn, to Francis Ferdinand at castle Miramar, and to the King of Italy at Rome.

In his statement before the Delegations, Count Berchtold paid great attention to Balkan affairs. He discerned a certain slackening of the tension between the Triple Alliance and the Triple Entente as the result of Great Britain's conciliatory action in the recent Balkan crisis. With Russia he hoped to cultivate a firm friendship. Referring to the estrangement of Rumania from Austria-Hungary, Count Berchtold declared that Rumanian statesmen could not for a moment think of throwing over the old Austro-Rumanian friendship. The Delegations then proceeded to discuss the requirements of the army and navy. The joint army estimates reached the figure of \$120,000,000, including \$500,000 for military aviation and \$6,000,000 for new howitzers and mortars. The navy estimates for 1914-15 amounted to almost \$37,000,000, of which sum \$10,000,000 constituted the first installment of a new five-year programme. Four new battle-ships, of 24,500 tons displacement each, were to form the second dreadnought division of the navy. Three fast cruisers were also to be constructed of 4800 tons each, besides six new torpedo gunboats of 900 tons, and two new Danube gunboats. A first-class naval base was to be prepared at Sebenico, and an arsenal at Pola.

THE SUBORDINATE NATIONALITIES. The year 1914 was remarkable for attempts made to conciliate the various minor groups whose nationalist sentiments were responsible for the chronic unrest prevalent within the Hapsburg Empire. To settle the racial question in Bohemia a conference of Czechs and German Bohemians was held, with the unsatisfactory result noted in the first paragraph of this article. The feud between the Poles and the Ruthenes in Galicia, however, was at least modified as the result of

a conciliatory effort in January, and both nationalities agreed to an electoral reform which assured to the Ruthenes a larger representation in the Galician *Landtag* (provincial Diet) as well as in the *Landesausschuss* (administrative committee) chosen by the *Landtag*. In Croatia the restoration of constitutional government, begun in the fall of 1913, was completed in the spring of 1914.

Less fortunate were the dealings of the Hungarian government with the 3,000,000 Rumanians who inhabited Eastern Hungary, the Bukovina, and Transylvania. The announcement that Count Tisza, the Hungarian Premier, was negotiating for the support of the Rumanians, in January, 1914, was met with angry protests from the Magyars. Count Czernin, Austro-Hungarian minister at Bucharest, added fuel to the fire when he publicly declared that the Rumanians in Hungary were not in possession of their proper rights. The rejection by the Rumanians of Count Tisza's kindly overtures did not improve the situation. The meeting in Bucharest of the Rumanian League of Culture, which decried Hungary's treatment of the Rumanians in Transylvania, aroused the Austro-Hungarian press to fury, because it indicated the tendency of Rumania to look for an extension of territory at the expense of Austria-Hungary, and with the support of Russia. Count Tisza deemed the incident sufficiently important to warrant discussion before the Hungarian House of Magnates. It would indeed be an evil day for Austria-Hungary when Russia should aid Rumania to take Transylvania, and Serbia to annex Bosnia-Herzegovina. Apprehension was felt in Austria-Hungary, moreover, lest the Russians should add the Ruthenian districts of Hungary and Austrian Galicia, in which there were over 3,000,000 Ruthenes, to the 25,000,000 Ruthenes already owing allegiance to the Czar.

In the course of the Hungarian treason trial, in February, Count Vladimir Bobrinsky described the proselytizing activities of the Russo-Galician Association, of which he was president, and acknowledged its endeavors to spread the Russian Orthodox religion, and to educate the Ruthenes in their own history, but denied that his efforts were directed against the Hapsburg monarchy. In explanation of this State trial, it may be noted that since the Ruthenes in Hungary were mostly Greek Catholics or Uniates (i.e. using the Greek rite but admitting the headship of the Roman pontiff), the Hungarian government had become alarmed at the tendency of the Ruthenes to affiliate with the Russian Orthodox Church, the national church of Russia. Suspecting the existence of an organized propaganda, whose objects were first the conversion of the Ruthenes to the Russian national church, and then the inclusion of the Ruthenes within the Russian Empire, the Hungarian government instituted in 1912 a monster trial of some 189 persons for alleged Russophil propaganda among the Hungarian Ruthenes. The trial was brought to a close on March 3, 1914, when 32 were found guilty of incitement against religion and State, and were sentenced to terms of imprisonment varying from six months to four and a half years. A second Ruthene trial was begun in March, of a journalist, two Orthodox priests, and a law student, on the charge of having conducted an agitation for the annexa-

tion of Galicia to Russia; but the four prisoners were acquitted and set at liberty in June.

SARAJEVO AND THE WAR. The assassination of the heir to the throne, Archduke Francis Ferdinand, at Sarajevo on June 28, 1914, by a Bosnian student Prinzip; the allegation of Serbian complicity in the crime; the ultimatum to Serbia, and the resulting world-wide war are treated in full in the article on the WAR OF THE NATIONS. Since Francis Ferdinand in marrying the Duchess of Hohenburg had renounced the right of his children to succeed to the Hapsburg throne, Archduke Charles Francis Joseph, nephew to Francis Ferdinand, and great-nephew to the Emperor, became the new heir to the throne. The father of Charles Francis Joseph was Otto, the younger brother of Francis Ferdinand, and the nephew of Francis Joseph. See also *INTERNATIONAL ARBITRATION AND PEACE, Bryan-Wilson Treaties*.

AUTOMOBILES. The estimated production of automobiles in 1914 in the United States is 500,000 cars. There were at the beginning of the year approximately 1,400,000 cars in use, bringing the total number at the end of the year up to very nearly 2,000,000. The most characteristic feature of 1914 was the continued increased production of low priced cars. At the beginning of 1914 the cheapest six-cylinder car was \$1500; at the beginning of 1915 it was \$750. Other features for 1914 were eight-cylinder motors, high stroke-bore ratios, spiral-bevel drive, vacuum-feed, cantilever springs, lower weights, and smaller tire and maintenance expense. The car of average price at the end of the year was \$2005, this being the lowest at any time in the history of the industry. In spite of this fact the 1914 car was more comfortable, easier riding, and had more to offer in the way of comforts for its passengers than any previous car. Great improvements were made in the appearance of car bodies; the clean molded lines have developed during the year, side lamps being largely eliminated, battery boxes taken from the running boards, and electric starting and lighting being used on cars costing as low as \$600.

The number of automobile manufacturers was less at the end than at the beginning of the year, as in December, 1914, there were 119 manufacturers, against 133 in January, 1914. The number has steadily decreased since 1911, when there were 270. Among makers of expensive cars the falling off in numbers was greater than in any other year, but in spite of this the percentage of six-cylinder cars increased. There was a falling off in the exports of automobiles in 1914, as compared with 1913, due to the conditions in Europe on account of the war. There were exported in the eleven months of 1914, 21,038 passenger cars, valued at \$18,523,010, compared with 23,579, valued at \$23,291,160 in 1913. The export of commercial cars, however, showed a large increase in 1914. For eleven months of the latter year 2151 cars of this class were exported, compared with 921 for the corresponding period in 1913. The total value of the cars exported in 1914 was \$5,598,027, compared with a value of \$1,586,147 in 1913.

RACING EVENTS. Automobiling as a sport made little progress in 1914, but plans were laid for the building of speedways in various parts of the country and the year 1915 should witness a considerable increase in the number of racing

events. The best showing of 1914, so far as speed is concerned, was made by Eddie Pullen who drove a Mercer 300 miles at an average rate of 87½ miles an hour. The Vanderbilt Cup and Grand Prize races were both held in California. Ralph De Palma won the Vanderbilt in a Mercedes, while Cullen captured the Grand Prize. De Palma's average was 75½ miles an hour and Cullen's 77½ miles. De Palma also was a victor in the Cobe and National trophy events held at Elgin, Ill., and the 25-mile race at Brighton Beach.

The annual 500-mile race on the Indianapolis Motor Speedway was won by Rene Thomas, a European driver in a Delage car, never before seen in the United States. The outcome of the race showed that Europe is still in the van when it comes to building speed machines. Thomas's average was 82½ miles an hour, a new record for the circuit. The Mercedes, a German car, carried off the laurels in the French Grand Prix by capturing first, second, and third places.

AUXETICS. See *CANCER*.

AVIATION. See *MILITARY PROGRESS*.

BACON, AUGUSTUS OCTAVIUS. United States Senator from Georgia, died Feb. 14, 1914. He was born in Bryan Co., Ga., in 1839, and graduated from the University of Georgia in 1859. In 1861 he entered the Confederate army as adjutant for a Georgian regiment, and later served as a captain on staff duty. He took part in the campaigns of northern Virginia. After the war he practiced law at Macon, Ga., became interested in politics, and served as a delegate to the State national conventions and as a presidential elector. From 1872 to 1882 and in 1892 and 1893 he was a member of the State House of Representatives, and he was several times candidate for the nomination of Governor of the State but each time defeated. Elected to the United States Senate in 1894, and reelected in 1900, 1907, and 1913, Senator Bacon became one of the leaders in that body, serving with distinction on the judiciary committee and being for many years the ranking Democrat on the foreign relations committee, of which he was chairman in the Sixty-second and Sixty-third Congresses. He was conservative, and had little in common with the modern radical tendencies of the Democratic party. Although opposed to the plan of direct election of Senators by the people, he was the first Senator to be chosen by that method. When the Secretary of State proclaimed the ratification of the Seventeenth Amendment providing for direct election, Senator Bacon had already been renominated by his party at a primary election as his own successor, and was waiting for a meeting of the legislature to ratify this choice. As soon as the constitutional amendment was proclaimed, the question arose as to whether or not Senator Bacon was entitled to accept his commission from the legislature, that body already having been chosen by the people. He was unwilling to have the title to his seat clouded in any way, and he immediately made preparations for submitting his candidacy to the test of a popular vote. He was reelected without opposition for the term ending March 3, 1919. His last conspicuous public service was in connection with the Mexican crisis. As chairman of the Foreign Relations Committee he gave President Wilson his most loyal support.

BACON, JOHN. An English artist, died Jan.

24, 1914. He was born in 1865, and early showed unusual talent in drawing and modeling. He studied at the Royal Academy schools and won many distinctions. His subsequent work was of a varied kind, including much book illustration, black and white, and water-color drawing. In 1903 he was elected an associate of the Royal Academy. His work in the later years of his life dealt almost entirely with portrait painting, and his excellence in this department led to his selection to paint the picture of the Coronation of King George.

BAER, GEORGE FREDERICK. An American lawyer, railway official, and capitalist, died April 26, 1914. He was born near the village of Lavansville, Somerset Co., Pa., in 1842, was educated in the common schools, and at the age of 13 became an apprentice in a newspaper office where he worked for two years. He studied at night and was able to enter Franklin and Marshall College. After leaving this institution he with his brother Henry acquired control of the Somerset Herald in 1861. In 1862 he organized the 133d Pennsylvania Volunteers. He served in Humphrey's division of the Army of the Potomac, participating in the second battle of Bull Run, Antietam, Fredericksburg, and Chancellorsville. He was then detailed as adjutant-general of the Second Brigade. He was one of the youngest officers in the Union army and was the youngest to receive the rank of major, with which he retired from service in 1864. He then resumed the study of law and in the same year was admitted to the bar. After remaining in Somerset for four years he removed to Reading where within a few years he became one of the leading lawyers. After winning several cases for the Reading Company, he became an attorney for that road in 1870. His association with this company continued until his death. He attracted the attention of the high officials of the railroad by his ability to master details of railroad organization and to develop a policy that worked with success. He became a director of the Philadelphia and Reading Railroad Company, but disagreement with the policy of the president caused him to resign. His ability to accomplish important matters attracted the attention of J. Pierpont Morgan, who wished to secure the entry for one of his railroads into Pittsburgh. He entrusted this to Mr. Baer, who accomplished it. For many years after this he was the confidential representative of Mr. Morgan in Pennsylvania. When the Morgan interests assumed control of the Philadelphia and Reading Railroad with the idea of reorganizing it, Mr. Baer had charge of the work, and in 1901 was made president of the Reading Company, the Philadelphia and Reading Railroad Company, and the Reading Coal and Iron Company. He was also made a director of the Lehigh Valley Railroad. Under his management the Reading Railroad became exceedingly prosperous. Mr. Baer came into public notice in 1902, when workers in the anthracite coal region struck for higher wages and recognition of the union. Mr. Baer had charge of the negotiations on the part of the employers and the demands of the laborers were refused. In the strike which followed, more than 145,000 miners were out of work and the situation became so serious that President Roosevelt interfered, with the final result that the question between the miners and operators was referred to a Commission.

Before that time Mr. Baer had announced that the coal operators would never recede from their position.

BAHAMAS. A group of about twenty inhabited islands and many uninhabited isles and islets, constituting a British colony, southeast of Florida. The total area is 4403½ square miles; pop., 55,944 (1911). The capital is Nassau, on New Providence. New Providence has 13,554 inhabitants. The principal industries are sisal cultivation (20,000 acres in 1912), canning, fishing, and sponge fishing. The trade is mainly with the United States. Imports and exports for the calendar year 1912 were valued at £358,111 and £276,116, respectively (£311,095 and £209,251 in 1911). Shipping entered and cleared in 1912-13, 1,247,844 tons, of which 127,558 tons British (1,739,957 tons in 1911-12, of which 149,415 tons British). The revenue and expenditure for 1912-13 were returned at £97,574 and £88,077, respectively (£85,592 and £82,076 in 1911-12). A wireless station has been installed at Nassau, whence also a cable communicates with Florida. There are no railways. The Governor (G. B. Haddon-Smith in 1914) is aided by an executive council not exceeding nine members.

BAILEY, WILLIAM WHITMAN. An American botanist and educator, died Feb. 20, 1914. He was born at West Point, N. Y., in 1843, and entered Brown University in 1860, but left college in 1862 to become a private in the Tenth Rhode Island Volunteers. After serving until 1864 he returned and graduated in that year. He took post-graduate courses there and also at Columbia and Harvard Universities, where he studied botany. In 1867 and 1868 he acted as botanist of the United States Geological Survey of the fortieth parallel. In the latter year he served as deputy Secretary of State of Rhode Island, and from 1869 to 1871 was assistant librarian at the Providence Athenaeum. After teaching botany in private schools at Providence he was appointed instructor in botany at Brown University in 1877. In 1881 he was appointed full professor and served in that chair until 1906, when he became professor emeritus and retired as special beneficiary of the Carnegie Foundation. He received the degree of LL.D. from the University of New Brunswick. Among his published writings are: *Botanical Collector's Handbook* (1881); *Among Rhode Island Wild Flowers* (1897); *Botanizing* (1899). He also published a volume of *Poems* in 1910 and contributed many articles to journals and magazines. He was a member of several botanical and patriotic societies.

BANDELIER, ADOLPH FRANCIS ALPHONSE. An American archaeologist and historian, died March 19, 1914. He was born in Berne, Switzerland, in 1840, and removed to the United States while still a youth. He had no schooling after his eighth year. After failing in several kinds of business he found his life work in archaeology. In 1880 the Archaeological Institute of America sent him to examine the ruins of the ancient Pueblos and to study native races of New

Mexico, Arizona, Mexico, and Central America. In Zuffi, with Mr. Frank Cushing, he made important discoveries. Starting in Mexico, Bandelier followed the path taken by Coronado in his expedition to what is now our Southwestern States and established the fact that the fabled Seven Cities of Cibola were merely villages whose riches had been greatly exaggerated in reports of the early Spanish explorers. From 1885 to 1892 he lived in Santa Fé, N. Mex., and for three years in that period was in charge of documentary studies for the Hemenway Archaeological Expedition. In 1892 he transferred his researches to Ecuador, Bolivia, and Peru, heading an expedition sent to these countries by Henry Villard, and in these journeys gathered great collections of antiquities for the American Museum of Natural History. Bandelier demonstrated the falsity of various historical myths, notably those concerning the Inca civilization of Peru. He also investigated the story of El Dorado, and found that it originated in the district about Lake Guatavita, in Colombia, where dwelt a tribe of Indians who whenever a new chief was chosen were accustomed to gild him and throw him into a lake. He was called El Dorado—the gilded man. In 1904 Bandelier was appointed lecturer on Spanish-American literature in its connection with ethnology and archaeology at Columbia University, and he held this post until his death. He was the author of many works on archaeological subjects and one novel. Among his most important works are: *The Art of War and Mode of Warfare* (1877); *A Report on the Ruins of the Pueblo of Pecos*; *Final Report of Investigations among the Indians of the Southwestern United States* (1880–85, part I 1890, part II 1892); *The Delight Makers*, a novel; *The Gilded Man*; *An Outline of the Documentary History of the Zuñi Tribe*; *The Islands of Titicaca and Koati* (1910). He also edited *The Journey of Alva Núñez Cabeza de Vaca from Florida to the Pacific*.

BANGS, LEMUEL BOLTON. An American physician, died Oct. 14, 1914. He was born in New York City, and graduated at the College of Physicians and Surgeons in 1872; was successively professor of genito-urinary diseases in the New York Post-Graduate Medical School and Hospital; genito-urinary surgeon in St. Mark's Hospital, New York; professor of genito-urinary surgery in the University and Bellevue Hospital Medical School (1898–1901). He was also consulting surgeon for various New York and Brooklyn hospitals and attending surgeon at the Bellevue Hospital. In 1895 he was President of the American Association of Genito-Urinary Surgeons. He wrote an *American Text-Book of Genito-Urinary Diseases* (1898).

BANKS AND BANKING. BANKING RESOURCES. The report of the Comptroller of the Currency showed that on June 30, 1914, there were 7525 national, 14,612 state, 634 mutual savings, 1466 stock savings, 1064 private banks, and 1564 loan and trust companies. The total resources of all of these reporting banks aggregated \$26,971,398,000. This was an increase for the year of \$1,259,000,000; and of 28 per cent as compared with 1909. The total loans and discounts were \$15,288,375,000; investments in stocks, bonds, and treasury warrants, \$5,584,924,000; cash on hand, \$1,639,219,000. The great item among liabilities was individual deposits amounting to \$18,517,732,000. Of this

slightly more than one-half was subject to check without notice; and slightly more than one-third constituted savings deposits. The enormous increase of deposits is shown by the fact that ten years earlier, in 1904, they were \$10,000,500,000, and in five years they had grown by \$4,500,000,000. Of the deposits national banks held one-third, and savings banks 27 per cent. Of the loans and discounts national banks were credited with 41 per cent; state banks with 19 per cent; loan and trust companies with 19 per cent; mutual savings banks with 14 per cent; and stock savings banks with 5.5 per cent. The distribution of the total resources of the various classes of banks was in very nearly the same proportions, showing the overwhelming preponderance of the national banks in the financial system of the United States. See **PRIVATE BANKS**.

FEDERAL RESERVE SYSTEM. After several years of public discussion and after several months of most thorough analysis in Congress the Owen-Glass bill, greatly modified by suggestions of bankers, business men and public leaders from all parts of the country, had been passed on Dec. 23, 1913. This comprised a most comprehensive reorganization of the banking and currency systems of the United States. The first step in carrying out the provisions of the new law was entrusted to an Organization Committee, of which Secretary of the Treasury McAdoo was chairman. This committee held hearings in January and February in New York, Boston, Washington, and a dozen other important cities. The task of dividing the country into districts centring about principal cities was a delicate one, inasmuch as each city was naturally jealous of contiguous territory. Meanwhile a formal letter was sent to the banks, including a copy of the act, and requesting decision as to membership. As early as January 15, fully 1500 banks had signified their intention of joining the new system. Nearly all of these were national banks and most of the large banks of the country were included. The hearings, completed in February, brought out numerous difficulties to be met in establishing a workable system of rediscounts, and in affecting clearings between different sections; at the same time they clarified banking and public opinion as to the main features of the plan proposed.

On April 3 the committee announced the outlines of the reserve districts that had been determined upon. It had been decided to divide the country into 12 districts, the maximum number permitted by the law. The principles which had guided the committee in determining boundaries were: the ability of the banks of each district to provide the minimum capital of \$4,000,000 required for a Federal reserve bank, this sum to be 6 per cent of the capital stock and surplus of member banks; the mercantile, industrial, and financial connections existing in each district; a fair and equitable division of the available banking capital of the country among the various districts; geographical conditions, transportation, and communication facilities; population, area, and existing business activities of the district. Many bankers and business men had favored the creation of the minimum number of districts; many moreover had favored a large bank of extraordinary size, having not less than \$25,000,000 capital as a sort of controlling institution in foreign exchanges; but neither of these ideas was carried out.

The following cities were chosen as the reserve cities: Boston, New York, Philadelphia, Cleveland, Richmond, Atlanta, Chicago, St. Louis, Minneapolis, Kansas City, Dallas, and San Francisco. The districts were numbered in the above order from 1 to 12. The areas of the districts varied from 39,865 square miles for Philadelphia, and 49,170 for New York, to 693,658 square miles for St. Louis. Minneapolis, Kansas City, and Dallas also have very large areas. The population of the districts ranged from 5,310,000 for Dallas, to 12,630,000 for Chicago. The 6 per cent subscription which would constitute the capital of the new reserve institutions varied from slightly above the \$4,000,000 minimum for Atlanta, to more than \$20,000,000 for New York City. The next step in the organization was the soliciting of subscriptions and the division of the subscribing banks of each district into three groups for voting purposes. These groups were determined by the amount of capital and surplus. Thus in district Number 1, voting group Number 1 included 148 banks having each an aggregate capital and surplus of \$250,000 or more; group Number 2, 148 banks with less than \$250,000, but more than \$120,000; and group Number 3 also included 148 banks with \$120,000 or less.

The actual organization of the twelve reserve banks involved next the choosing of directors. There are nine directors for each reserve bank, six chosen by member banks in two groups (Class A and Class B) of three each, and three appointed by the Federal Reserve Board. The members of this latter board by law included Secretary of the Treasury William G. McAdoo, Comptroller of the Currency John Skelton Williams, and five others to be appointed by the President. The President completed this list as follows: Charles S. Hamlin of Boston, F. A. Delano of Chicago, Paul M. Warburg of New York, W. P. G. Harding of Birmingham, and A. C. Miller of San Francisco. On June 2 and 3 the manner of holding elections for directors was sent to the individual banks. These instructions indicated that each bank should elect by ballot the district reserve elector, and in addition nominate a candidate for a Class A, and a candidate for a Class B director. Class A directors represented banks, and Class B directors represented agricultural, commercial, and industrial interests. The result of the selections showed that in the majority of cases directors chosen represented the larger banks and larger commercial and industrial interests, and that few direct representatives of the smaller banks and corporations were included.

On August 12 the Federal Reserve Board was formally organized. Its first work was the formulating of proposed amendments to the Federal Reserve Act. These proposals, however, did not meet with Congressional favor. Its second activity was to complete the directorates of the twelve district reserve banks by naming the three Class C directors for each. One of these in each case was to constitute the Federal Reserve Agent in each district, and one was to be the Deputy Federal Reserve Agent. On October 20-22 a conference of the directors of the Federal Reserve Banks was held in Washington at which were present three-fourths of all directors. The conference determined upon November 30 as the date before which each Federal Reserve Bank should be in working order. On December

15 was organized at Washington the Advisory Council of the Federal Reserve Banking System, a body composed of bankers and business men from the various districts. This council will work in conjunction with the Federal Reserve Board in the determination of policies. At this first session reports from all parts of the country showed credit conditions good, reserves abundant, and short term money cheap. The Reserve Board presented questions relating to time deposits, acceptances, and state banks.

Statement of December 18. According to the summary of conditions of the twelve Federal Reserve Banks on December 18, they held gold coin and bullion to the amount of \$233,279,000, and other legal tender to the amount of \$23,008,000. Their total discounts equaled only \$9,043,000. Capital paid in amounted to \$18,050,000; reserve deposits, \$248,084,000; and Federal reserve notes in circulation, \$3,856,000.

HOARDING BY BANKS. On September 25 Secretary McAdoo caused a considerable sensation by accusing banks of withholding credit and charging exorbitant rates of interest. He published a list of 247 national banks, comprising nearly every part of the country, which he believed were not extending legitimate credit as shown by their having more than 25 per cent reserves. He stated also that State banks and trust companies were likewise guilty. He showed that 7 per cent and 8 per cent were being charged for loans and declared that the funds tied up by excess reserves were sorely needed to ease the credit market. On the other hand, it was claimed that the national banking act and the existing inability to dispose of liquid securities forced the individual banks in self-defense to the tactics they had pursued. The Secretary's letter, however, directed attention to the situation and brought about a considerable betterment of the situation. In an address in New York on December 3, Mr. C. S. Hamlin, Governor of the Federal Reserve Board, expressed the view that under the new reserve system banks would no longer need to engage in a struggle for self-preservation, that hoarding in times of a tight money market was a thing of the past.

BANKING COÖPERATION. The extraordinary financial situation created by the war resulted in several remarkable manifestations of coöperation among the bankers. One of the several weaknesses of the American banking system has been the lack of a basis for concentration of reserves and concerted action at critical times. The Federal Reserve Act was designed to remove this excessive individualism from the entire system. Previously in every time of stress each bank sought to protect itself by increasing its gold holdings and restricting its loans. Thus credit disappeared at the time when most needed. The war crisis threatened a similar catastrophe before the new Federal Reserve banks were in operation. Collapse was, however, largely forestalled by the New York City banks in August combining to create a fund of \$100,000,000, more than four-fifths of which was to meet immediate obligations of New York City held by foreign investors. Then in September and October, under the lead of the Federal Reserve Board and a committee of clearing-house delegates, a *Gold Pool* of \$100,000,000 was created by the contribution of banks in reserve cities in proportion to their gold holdings. This fund was to be

1470

used for export if necessary, and otherwise to guarantee that American obligations held abroad should be met at maturity. This action was due to the most unusual pressure of American obligations due abroad. Several hundred million dollars of short-term loans were to mature during the closing months of the year. In normal times these could have been renewed or met by the fall exports, especially of cotton. While, however, exports in some lines, and notably of wheat, increased, those of cotton were for several months greatly impeded. American bankers were therefore confronted with the necessity of insuring themselves against the complete collapse of foreign exchange or protecting themselves behind an unofficial moratorium. By October 15 the subscriptions to the fund aggregated \$105,000,000. Quantities of this gold were shipped to Ottawa, Canada, to a branch of the Bank of England, and served as a basis for sterling exchange on London.

Another important instance of cooperation was the formation of a fund known as the *Cotton Loan Pool*, for the relief of the southern farmers whose market had been destroyed by the war. The cotton crop was somewhat larger than in recent years, being estimated at at least 15,000,000 bales, representing a minimum normal value of \$750,000,000. Cotton exchanges being closed all over the world, and cotton mills generally either closed or running at small capacity, and southern banks having already made rather extensive loans against cotton, southern planters were in danger of great financial distress unless facilities were created whereby their cotton could serve as a basis for credit. The crucial situation of many planters was aggravated by the custom of planting, cultivating, and harvesting cotton on the basis of credit extended by local merchants. In August the cotton growers proposed to the government that it give them relief either by a valorization scheme such as the Brazilian coffee valorization plan, or by loans made on cotton. Secretary McAdoo at once rejected the former plan and showed unwillingness to undertake a direct government loan. Schemes to secure funds for cotton loans by the issue of bonds or Treasury notes were not accepted. Following a conference on August 24-25 of bankers, brokers, and growers, Secretary McAdoo announced that he would permit banks to present warehouse cotton certificates as a basis for the issue of emergency currency. The demand of tobacco growers and producers of naval stores that their products be similarly favored was granted; thus a unique use was made of the Aldrich-Vreeland Act. But more extensive banking resources were needed to carry the cotton crop. Finally a scheme originated by bankers and other private persons took the form of a proposal to raise \$135,000,000 in the form of pledges from banks, corporations, and individuals to supply funds for cotton loans; these pledges were deposited with the members of the Federal Reserve Board acting as individuals. There were two forms of subscriptions. The Class A certificates represented individuals and institutions outside the cotton growing States, and Class B certificates, subscriptions from banks within the cotton States who already had made loans on cotton, or wished to do so. The subscribing of \$100,000,000 of the Class A certificates was completed on November 17. New York City banks had subscribed \$53,000,000 of the total \$100,

292,000; Chicago, \$13,000,000; St. Louis, \$11,500,000; Philadelphia, \$4,640,000; Kansas City, Cleveland, Cincinnati, Boston, Baltimore, and Pittsburgh had each subscribed \$2,000,000 or more, and Washington, Louisville, Detroit, and San Francisco smaller sums.

The final plan for the working of the pool dated November 30 provided for loans on middling cotton at the rate of 5 cents per pound. These loans were to be made direct to growers through southern banks. These latter were to furnish one-fourth of the total loan, and the banks subscribing to Class A certificates the remaining three-fourths. The \$100,000,000 pool would thus make possible total loans of \$133,333,000. All applications for loans must be made before Feb. 1, 1915, and all expire one year later; they may be repaid on 30 days' notice. Loans were to bear 6 per cent interest, and no commission was given the southern banks negotiating the loans. In repayment preference was to be given to the holders of Class A certificates. It was not expected that the entire fund would be needed, as the opening of the cotton exchanges and the development of the export trade had materially altered the situation after the pool plan had been launched. See for other details FINANCIAL REVIEW.

THE INDUSTRIAL FINANCE CORPORATION was organized early in 1914 to bring banking facilities in reach of many for whom previously lacking. Its president is Dr. E. R. L. Gould, and its directors include various bankers, prominent educators, and business men of New York and Chicago. The object is to aid in the formation of loan and savings banks on the "Morris Plan." This plan was begun at Norfolk, Va., by Arthur J. Morris after a study of the Schulze-Delitzsch and Raiffeisen banks of Germany. The plan facilitates loans for legitimate purposes to persons of small means by providing for loans based on the security of promissory notes signed by the borrower and two friends. Such a note replaces the ordinary chattel mortgage and will also, it is expected, make heavy inroads into the salary loan business. The motto of the new corporation is J. P. Morgan's statement, "Character is the basis of credit." Following the initial success of Mr. Morris, banks were opened in 1912 at Atlanta, Baltimore, Washington, Memphis, and Richmond. In 1913 and 1914 banks were opened in St. Louis, Denver, Philadelphia, Springfield, Mass., Columbia, Charleston, Lynchburg, Portsmouth, Durham, and Nashville. Experience thus far has shown that losses are very small in comparison to the services rendered. The undertaking is in nowise charitable, but might be classed as a self-sustaining and moderately paying philanthropy.

GUARANTEE OF DEPOSITS. In 1908 Oklahoma passed a law whereby a fund was created to guarantee deposits in State banks. This lead was followed the next year by Kansas and Texas, and in 1911 by Nebraska. In all of these States the general principle was a compulsory contribution by State banks to a guaranty fund controlled by the State. Up to 1914 there had been three failures in Kansas which had cost the fund about \$30,000, yet the fund held early in 1914 cash to the amount of \$111,000, and bonds valued at \$366,000. There had been three failures in Texas which had cost the fund \$100,000, but there remained nearly \$1,000,000. Up to 1914, in Nebraska there had been no failures,

and the fund amounted to more than \$810,000.

In Oklahoma, on the other hand, there had been 25 failures which were explained by the greater amount of speculation in that State, inadequate banking supervision, and pernicious political interference. The banks during these years had paid more than \$2,000,000 in assessments to the guaranty fund; nevertheless, about \$800,000 was needed in the early months of the year to meet depositors' guaranty-fund warrants. These latter are issued when cash is lacking. The fund held assets having a face value of \$2,500,000, but actual cash value of not 20 per cent as much. In spite of this special tax, Oklahoma banks had earned more than 15 per cent net on capital in recent years. The general cause of Oklahoma's unfavorable experience was believed to be its weak and inadequate banking law. The guarantee idea being only an application of the insurance principle to banking and bank deposits, it should succeed wherever banking itself is sound. State officials had determined to clear up the financial condition of the guaranty fund if possible by levying two annual assessments of one-fifth of one per cent of the average deposits on all State banks during 1914, 1915, and 1916. The object was to create for the fund assets equal to 2 per cent of the average aggregate deposits of State banks.

In Wisconsin the guarantee idea was defeated by the bankers in the State Legislature in 1914 after an active campaign, on the ground that the bankers would not have control of the guaranty fund. To satisfy the demand for some kind of deposit insurance, bankers formed a mutual company to guarantee the deposits of such banks as cared to join.

NEW YORK LAW. The Van Tuyl Commission authorized by the New York Legislature in 1913 reported Feb. 1, 1914. It held numerous sessions under the chairmanship of Mr. A. Barton Hepburn, and conducted an investigation into every phase of the banking interests of New York State. On the basis of its recommendations the Legislature passed a law in March designed to enable the State banks to compete more successfully with the National banks under the new Federal Reserve system. The most important change in the State laws dealt with the reserve requirements, these being generally reduced. The new law requires that State banks of Manhattan Borough, New York City, must keep reserves of 18 per cent of their deposits; of this 12 per cent must be on hand, and 6 per cent may be on deposit with authorized reserve agents. Trust companies of Manhattan Borough must keep a 15 per cent reserve; of this 10 per cent must be on hand, and 5 per cent may be on deposit. In any borough of one million to two million inhabitants, State banks must have a reserve of 15 per cent; of this 10 per cent must be on hand, and 5 per cent may be on deposit. Trust companies in such a borough must have a reserve of 13 per cent; of this 8 per cent must be on hand, and 5 per cent may be on deposit. State banks elsewhere must keep a reserve of 12 per cent; of this 4 per cent must be on hand, and 8 per cent on deposit. Trust companies elsewhere must keep a reserve of 10 per cent; of this 4 per cent must be on hand, and 6 per cent may be on deposit; but in cities of less than one hundred thousand inhabitants, trust companies need keep only 3 per cent on hand. One-half of the legal reserve under the

new law must be in gold,—bullion, coin, or certificates,—or in United States notes; and the remainder in lawful money. The State Superintendent of Banking is authorized to designate reserve institutions under conditions prescribed in the law; but any bank which is a member of a Federal Reserve Association may keep its reserves in a Federal Reserve Bank.

This law is expected to accomplish a great expansion of credit. This will result primarily from the permission to the State institutions to deal in drafts based on acceptances of commercial paper. In Manhattan Borough, banks may accept drafts of one individual firm or corporation up to 25 per cent of the bank's capital and surplus; elsewhere such drafts may be accepted up to 40 per cent of the bank's capital and surplus. These drafts must be drawn in good faith against real values. One object is to develop in New York an acceptance and discount market similar to that in London. Since the aggregate capital and surplus of New York State banks and trust companies amounts to \$340,000,000, and since each institution may accept bills up to 25 per cent or even 40 per cent of its capital and surplus from each of the firms arranging for such credit, it is evident that an enormous amount of business of this sort is rendered possible.

Thus the new law is expected to maintain the competitive power of the State banks who remain outside of the Federal Reserve system, and to develop a rivalry between State bank acceptances and Federal Reserve re-discounts.

The new law also authorized the formation of land banks with power to issue debenture bonds against guaranteed real estate mortgages. Finally, private and unincorporated banks were drastically dealt with.

GREAT BRITAIN. *Banking Consolidation.* The most striking feature of the British banking evolution in the past few years has been the manifest tendency toward amalgamation. This has affected not only banks of the first grade, but also the lesser and weaker ones. In April, 1914, Lloyd's Bank had absorbed Wilts and Dorset Bank with nearly \$60,000,000 deposits. This gave Lloyd's the vast sum of one-half billion dollars of deposits, and the primacy among English banks with respect to deposits. Shortly thereafter the London City and Midland Bank absorbed the Metropolitan Bank of England and Wales with 156 branches and \$58,000,000 deposits. This restored the London City and Midland Bank to first place with about 1000 branches, and more than one-half billion deposits. This rivalry of the two largest institutions suggested to some merchants and bankers a dangerous struggle for mere leadership in size. On the other hand, it suggested to others a dangerous tendency toward monopoly. This latter feeling called forth a protest to which the management of the leading institution declared that monopoly of banking facilities is impossible; that amalgamation intensifies competition, and at the same time increases stability. It was pointed out that amalgamation must soon reach its limit because of lack of new banks to amalgamate. Moreover consolidation was held to be an advantage in the control of gold reserves, and the avoidance of banking and commercial crises. The charge that consolidation leads to the destruction of the personal relationships of merchants and customers was denied, since the

management of local banks was as a rule not disturbed by the amalgamation. Nevertheless, merchants protested that these enormous institutions are managed by general rules which tend to crush out individuality and character. Thus immediately following legislation in the United States designed to check concentration, a certain alarm manifested itself in England over the tendency to excessive combination.

Other matter of interest in connection with the study of banking conditions will be found under the following articles: NATIONAL BANKS; STATE BANKS; SAVINGS BANKS; POSTAL SAVINGS BANKS; LOAN AND TRUST COMPANIES; AGRICULTURAL CREDIT; MONEY; and FINANCIAL REVIEW.

Bibliography. Among the books of the year were the following: L. D. Brandeis, *Other People's Money and How the Banks Use It*; A. Desjardins, *Coöperative People's Banks*; G. W. Dowrie, *Development of Banking in Illinois, 1817-1863*; Irving Fisher, *Why Is the Dollar Shrinking?*; J. T. Holdsworth, *Money, Credit, and Banking*; H. Bilgram and L. E. Levy, *Cause of Business Depressions*; J. J. MacLaren, *Banks and Banking (Canada)*; W. P. Wei, *Currency Problems In China*; H. Withers, *Meaning of Money*.

BAPTISTS. The total number of Baptists in the United States in 1914, according to the statistics of the *American Baptist Year Book* for that year, was 5,799,253, compared with 5,529,573 in 1913. The total number in the world is given by the same authority as 6,847,286, compared with 6,516,483 in 1913. The denomination in the United States is divided into two main, and a number of smaller subdivisions. The two main branches are known as the regular Baptists, and include the Northern and Southern branches. The Northern Baptists had in 1914, 1,291,668 communicants, 9534 churches, and 8250 ministers. The Southern Baptists had 2,522,623 communicants, 24,288 churches, and 14,909 ministers. The larger of the smaller subdivisions are the Primitive Baptists, with about 100,000 communicants; the Free Baptists (see below); the Free Will Baptists, with 57,231 communicants; and the General Baptists, with about 33,600. The denomination has a large colored membership in the South. There were in 1913, 1,934,952 communicants in the regular colored Baptist denomination. There are in addition several smaller subdivisions of the colored Baptists. The general work of the larger denominations is in the hands of the Northern Baptists' convention, and the Southern Baptists' convention. The meeting of the Northern Baptists' convention was held at Boston on June 19. Resolutions were passed favoring the disarmament and compulsory arbitration, and opposing the liquor traffic and sectarianism in State affairs. Cigarette smoking was forbidden the members of the Church. John D. Rockefeller gave \$50,000 with a promise of an additional sum to pay off the debts of the denomination. The Southern Baptists' convention also met in June. The missionary work of the denomination is conducted by the American Baptist Foreign Missionary Society. Missions are maintained in practically all quarters of the globe. For foreign missions there was contributed in 1914, \$1,206,202. Home and State missions are also conducted on a large scale. Nearly \$1,000,000 was contributed for each of these purposes

in 1914. The total contributions for all purposes in 1914 amounted to \$27,549,711. The denomination maintains 12 theological seminaries, and has under its auspices 95 colleges and universities. For an account of the movement which has been in progress for several years to bring about a union between the Baptists and Free Baptists, see the following article on BAPTISTS, FREE.

BAPTISTS, FREE. This denomination originated in 1780 in New Durham, N. H., under the preaching of Benjamin Randall, who was disfellowshipped by the New Hampshire Baptist Association because of his preaching "Free Will" when Baptists believed and preached foreordination. Free Baptists spread rapidly through New Hampshire and the adjacent New England States, and thence into the middle western States. Because of their opposition to slavery, a large membership in the South, still numerous in North Carolina and parts of Tennessee, broke off from the General Conference of Free Baptists which was organized in 1827. Owing to changes which have taken place in all Baptist bodies, the differences between Baptists and Free Baptists had so far disappeared that in 1904 committees representing both bodies were appointed to plan for a restoration of fellowship and a union of forces. In October, 1911, this union was inaugurated by the transference on the part of the Free Baptists of their missionary and denominational activities to the three national missionary organizations of the Baptists, the American Baptist Foreign Mission Society, the American Baptist Home Mission Society, and the American Baptist Publication Society. This blending of denominational interests has proceeded harmoniously and is still in progress. At the same time union of State organizations has been practically accomplished in most of the States. In Maine and New Hampshire, where the numbers of the two bodies are more nearly equal, the designation "United Baptists" will probably be used. This designation has already been agreed upon in Maine. In 1914 the denomination had 65,440 members, 1110 churches, and 805 ministers. See also BAPTISTS; and RELIGIOUS DENOMINATIONS AND MOVEMENTS.

BAR ASSOCIATION, AMERICAN. The annual meeting of the association was held at Washington on October 20, 21, and 22. An address of welcome was delivered by President Wilson, and the annual address was delivered by Hon. William H. Taft, president of the association. Several notable addresses were delivered. Among these were the following: "The Layman's Criticism of the Lawyer," Hon. Elihu Root; "The Constitution of Canada," Sir Charles Fitzpatrick, Chief Justice of the Dominion of Canada; "The Argentine Constitutional Ideas," Hon. Romulo S. Naón, Ambassador of the Argentine Republic to the United States. Among the committees which rendered reports were the Special Committee to Suggest Remedies and Formulate Proposed Laws to Prevent Delay and Unnecessary Cost in Litigation; Committee on Commercial Law; Committee on International Law; Committee on Taxation; Special Committee on Legislative Drafting; Committee to Oppose the Judicial Recall; Committee on Insurance Law; Committee on Law Reporting and Digesting; and the Special Committee to Present Bills to Congress relating to Courts of

Admiralty. The officers in 1914 were as follows: William H. Taft, president; George Whitelock, secretary; Frederick E. Wadhams, treasurer.

BARBADOS. An island, the most easterly of the West Indian group, constituting a British colony; one of the Caribbee Islands. Area, 166 square miles; pop. (1911), 171,892 (135,939 in 1851). The capital and port is Bridgetown, with (1911) 16,648 inhabitants. There are 161 primary schools, with 26,276 enrolled pupils. The staple products are sugar and cotton; these, with molasses and rum, constitute the principal exports. About 64,000 acres are estimated to be under sugar; the sugar works in operation in 1911 were 330, producing 23,524 hogsheads of sugar, and 84,887 puncheons of molasses (in 1912, 28,732, and 85,663). The cotton industry is being revived, the export to the United Kingdom in 1912 being 415,887 pounds, of the estimated value of £26,191 (740,269 pounds, valued at £43,182 in 1911). The imports for 1912 were valued at £1,465,431 (£1,539,710 in 1911), and the exports at £1,085,569 (£1,005,931 in 1911). The chief imports are rice, salted meat and fish, grain, flour, and textiles. Total tonnage entered and cleared during 1912-13 was 3,346,982, of which 2,604,772 tons British (3,475,511 tons in 1911-12, of which 2,620,223 tons British). Revenue and expenditure for the year 1912-13 were £234,126 and £230,339, respectively; £221,906 and £215,697 in 1911-12. In 1885 Barbados was separated from the other Windward Islands, with a governor—Sir Leslie Probyn in 1913 (W. L. C. Phillips, acting).

BARGE CANALS. See CANALS.

BARLEY. The world's barley production in 1914 as indicated by crop estimates for most of the barley producing countries was lower than in 1913, and the reduction in yield was relatively greater than in the case of wheat and rye, which also gave smaller yields than in the preceding year. Although the production was reduced as compared with the year before, it was pointed out by the International Institute of Agriculture that it was perceptibly above the average yield for the ten years 1903-12. The estimates of production for countries in the Northern Hemisphere where practically all of the world's barley is grown were as follows: European Russia, 476,200,000 bushels, including 8,900,000 bushels of winter barley; Japan, 102,700,000 bushels; Prussia, 81,500,000; Spain, 73,650,000; Hungary, 67,100,000; United Kingdom, 66,140,000; Roumania, 23,450,000; Denmark, 22,830,000; Bulgaria, 16,065,000; and Sweden, 13,050,000 bushels. Data for Austria, and for the countries of the German Empire, except Prussia, were not available. Italy, which produced about 11,000,000 bushels in 1913, yielded only 64 per cent of that quantity in 1914, and Algeria produced only a little over one-third the yield of the year before. Tunis produced only 3,200,000 bushels, or about one-half as much as in 1913. The average yield per acre in 1914 ranged from 50 bushels in Belgium, to 3.7 bushels in Tunisia. As a rule the acre yield is low in southern Europe and northern Africa, as compared with northern Europe, the United States, Canada, and Japan. The Canadian crop of 1914, injured by dry weather in the western provinces, was estimated at 37,014,000 bushels, as compared with 48,319,000 bushels the preceding year. The average yield per acre for the two years was re-

ported as 24.7, and 29.96 bushels, respectively. About half of the Canadian barley crop of 1914 was produced by the Province of Ontario. In the United States the hot and dry weather did less damage, as the crop was nearer maturity, than in the Canadian barley fields further north. As reported by the Department of Agriculture, the production in 1914 was 194,953,000 bushels on 7,565,000 acres, the average yield per acre being 25.8 bushels; and the value of the crop based on a bushel value of 54.3 cents, the average price received by farmers December 1, was \$105,903,000, or about 10 per cent greater than the value of the preceding crop. The yield in 1913 was 178,189,000 bushels, and the area, 7,499,000 acres, the average yield being 23.8 bushels per acre. The leading barley States and their yields as reported by the *American Agriculturist* were as follows: California, 42,300,000; Minnesota, 30,797,000; North Dakota, 27,000,000; South Dakota, 22,225,000; Wisconsin, 19,600,000; and Iowa, 10,322,000 bushels. California, Minnesota, and North Dakota each devoted over 1,000,000 acres to the crop. The highest average yield per acre, 36 bushels, was reported for Washington, Montana ranking next with 35 bushels.

BARLOW, JOHN WHITNEY. An American soldier, died March 2, 1914. He was born in Perry, N. Y., in 1838, and received his early education in the public schools and in an academy in Wisconsin. In 1861 he graduated from the United States Military Academy and was appointed second lieutenant in the United States Artillery. In the following year he was transferred to the topographical engineers, and in 1863 to the engineering corps. In the same year he was appointed captain. He was brevetted captain on May 27, 1862, for "gallant and meritorious services in the battle of Hanover Court House, Va." He also received brevets of major for services in the Atlanta campaign, and of lieutenant-colonel for services before Nashville, Tenn. He took part in the Peninsular campaign and participated in battles at Yorktown and Williamsburg, and in the seven days' battle before Richmond. During the last months of the war he served with the engineering battalion of the Army of the Potomac. After the war he was superintendent of many engineering works. He also made explorations of the headwaters at the Yellowstone and Mississippi Rivers, was senior commissioner in marking the boundary between the United States and Mexico from 1892 to 1896, and served as division engineer in construction of fortifications in different parts of the country. He was a member of the board for fortifications in the United States, and member and president of the boards of engineers in connection with various surveys and engineering operations. In 1901 he was appointed brigadier-general and chief of engineers and retired in May of that year at his own request after 40 years of active service. He was a member of several patriotic societies.

BAROTSELAND. See RHODESIA.

BASEBALL. The year 1914 was a turbulent one in the baseball world. A new league, the Federal, was born, and bitter warfare was waged between the infant organization and "organized" baseball as represented by the National and American Leagues. Several of the most prominent stars of the game cast their fortunes with

the new body, which established clubs in Chicago, Indianapolis, St. Louis, Kansas City, Pittsburgh, Buffalo, Baltimore, and Brooklyn. In four of the cities "invaded," either National or American League teams, or both, existed, causing conflicts of game and a strenuous battle for the patronage of the fans.

From a money making point of view, the Federals were not a success, but men of wealth were enlisted in their cause, and despite the experience of their first year, the officials of the new league expressed confidence that a solid foundation for the future had been laid. The "jumping" of the players in response to the new competition afforded by the Federals led to many litigations, some of which are still pending.

The year also furnished one of the most exciting pennant races in the history of the sport and witnessed the crumbling and fall of perhaps the best baseball machine that has ever been builded. The amazing spurt of the Boston Braves in the National League, which resulted in the capture of the flag and finally in the overwhelming defeat of the Philadelphia Athletics in the World's Series, created a furore in baseballdom.

The New York Giants, seemingly, were well on their way to a fourth consecutive pennant when in mid-July, Boston suddenly emerged from the league cellar and began its climb to the top. The big lead of the Giants was gradually cut down until the closing weeks of the season found the two teams running neck and neck. A series between the two resulted disastrously for the Giants, the Braves going into first place, which they never relinquished.

In the meantime the Philadelphia Athletics had had a walkover in the American League, securing such an advantage in the early stages of the race that the pennant was captured with the greatest ease. The Athletics, because of their past record, were favored by the majority of fans to capture the world's title, the wonderful showing of the Braves being attributed chiefly to the weakness of the other National League teams. But another surprise was in store. The champion Athletics failed to win a single game in the world's series.

Five players were largely responsible for the triumph of the Braves. They were: Hank Gowdy, catcher, with his terrific and timely hitting; Dick Rudolph and Bill James with their masterly pitching, and Johnny Evers and "Rabbit" Maranville with their brilliant defensive work. The score of each contest follows: Boston 7, Philadelphia 1; Boston 1, Philadelphia 0; Boston 5, Philadelphia 4; Boston 3, Philadelphia 1.

The composite score gave Boston a batting average of .244 and a fielding average of .978 as against a batting average of .172 for Philadelphia and a fielding average of .983. The paid attendance was 111,009 and the receipts \$225,739, both showing a big falling off as compared with the 1913 series.

The race in the Federal League had an exciting finish. It was not until a few days before the close of the season that the Indianapolis team gained a permanent hold on first place.

The leading batter in the National League was Jake Daubert of the Brooklyn Superbas who had an average of .329. In the American League Ty Cobb of Detroit repeated his won-

derful showing of previous years in again capturing the honors with the stick. His average was .368. Benny Kauff of Indianapolis led the Federal League in batting with an average of .366. The leading pitcher of the National League, as based on the average number of runs scored per 9-inning game, was Billy Doak of the St. Louis Cardinals, his mark being 1.72. In the American League "Dutch" Leonard of the Boston Red Sox carried off the laurels with an average of 1.01. Russell Ford of the Buffalo team made the best showing of the Federals with an average of 1.56. The leading base runners of the three leagues were: George Burns of the New York Giants, Eddie Collins of the Philadelphia Athletics, and Benny Kauff of the Indianapolis Feds.

The final standing of the clubs in the National League was: Boston won 94, lost 59; New York won 84, lost 70; St. Louis won 81, lost 72; Chicago won 78, lost 76; Brooklyn won 75, lost 79; Philadelphia won 74, lost 80; Pittsburgh won 69, lost 85; Cincinnati won 60, lost 94. The American League standing was: Philadelphia won 99, lost 53; Boston won 91, lost 62; Washington won 81, lost 73; Detroit won 80, lost 73; St. Louis won 71, lost 82; New York won 70, lost 84; Chicago won 70, lost 84; Cleveland won 51, lost 102. The rating of the Federal League follows: Indianapolis won 88, lost 65; Chicago won 87, lost 67; Baltimore won 84, lost 70; Buffalo won 80, lost 71; Brooklyn won 77, lost 77; Kansas City won 68, lost 84; Pittsburgh won 64, lost 87; St. Louis won 62, lost 89.

The pennant winners in the more important leagues in 1914 were: International, Providence; American Association, Milwaukee; Southern, Birmingham; Eastern Association, New London; Pacific Coast, Portland; New England, Lawrence; Canadian, Ottawa.

The college baseball season, as usual, was unsatisfactory in the problem presented to pick a championship team. Harvard, Cornell, and Pennsylvania all had first class nines with the Crimson displaying more efficient batting and better fielding prowess. Brown, Yale, Williams, and Dartmouth also showed considerable strength.

Some of the more important intercollegiate games were: Columbia 6, Pennsylvania 1; Yale 12, Mt. St. Joseph, 9; Harvard 15, Army 6; Pennsylvania 6, Yale 5; Princeton 6, Brown 2; Columbia 6, Fordham 2; Yale 8, Columbia 3; Harvard 10, Navy 5; Pennsylvania 2, Rutgers 0; Princeton 10, Fordham 1; Brown 3, Yale 2; Georgetown 10, Yale 1; Columbia 9, Stevens 1; Lafayette 5, Pennsylvania 1; Princeton 5, Virginia 4; Yale 2, Dartmouth 1; Columbia 8, Pennsylvania 5; Williams 3, Princeton 2; Brown 2, Yale 1; Holy Cross 3, Harvard 2; Yale 11, Amherst 1; Harvard 5, Williams 3; Pennsylvania 5, Columbia 4.

BASKETBALL. The struggle for supremacy in intercollegiate basketball in 1914 resulted in a tie between the fives of Cornell and Columbia, each winning eight games and losing two. The standing of the other teams follows: Yale won 6, lost 4; Princeton won 5, lost 5; Pennsylvania won 2, lost 8; Dartmouth won 1, lost 9; Halstead of Cornell scored the most points during the season, his total being 130. Bloom of Pennsylvania ranked second with 89 points.

The A. A. U. championship was won by the

Cornells of Chicago with the Y. M. Fellowship Club of Chicago second. The New York State championship was won by Utica, Troy finishing second. In the New England League Newton was the victor and in the Connecticut Valley League Winfield carried off the laurels.

BATTERIES, ELECTRIC. See **ELECTRIC BATTERIES.**

BATTLESHIPS. The great war has accelerated the construction of battleships in hand—especially in Great Britain and Germany—but has not increased the number so far laid down. It is reported that Holland contemplates building five dreadnoughts of moderate size and there is a strong sentiment in the United States for naval increase. The numbers of ships completed and building for the various navies are shown in the tables given under Naval Progress (q.v.). The design of the most recent battleships exhibit characteristics as shown under the following heads:

DIMENSIONS. The tendency to increased size continues, thus:

BATTLESHIPS		
Nation	Latest type	Largest previous type
France	29,500	24,800
Germany	30,000	29,000
Great Britain	27,000	27,500
Italy	28,000	22,500
Japan	31,800	21,000
Russia	22,435	23,000
United States	32,000	31,400
BATTLE CRUISERS		
Germany	28,000	26,500
Great Britain	30,000	27,000
Japan	27,500	14,600
Russia	82,500

Though the advocates of moderate dimensions are numerous, the requirements of speed, gun strategy, and protection against gunfire and torpedoes obviously demand increased size or a giving up of the attempt to obtain certain desirable qualities.

SPEED. The speed of battleships and battle cruisers has risen slightly in many navies, reaching 23 knots in the new German, Japanese, and Russian battleships and 25 knots in the Italian. The new British ships are reported to have a speed of 22.5 knots, but this is uncertain. United States, France, and Austria adhere to a sea speed of about 21 knots, preferring to add to armor and guns rather than speed.

ARMOR. The belts of new ships are wider and thicker, reaching 15 inches in recent German battleships and 16 inches in the U. S. S. *California* class. Armor for turrets and conning towers is thicker in all recent ships, particularly the American, though the armor protection of the secondary battery has, in these vessels, been omitted. The success of the torpedo in the present war is likely to result in armoring the bottoms of battleships—that is, extending the armor downward from the belt to the turn of the bilge.

ARMAMENT. There has been no change in the calibres of guns for battleships except that Austria has adopted the 14-inch gun for the ships of the 1914 programme and Italy intends to mount 15-inch guns in her latest class of dreadnoughts. The new Austrian ships will have 10 guns in four turrets arranged like those of the *Nevada* class.

TORPEDO TUBES. The number of torpedo

tubes is being increased in all the recently designed battleships. The reasons for this are the increased power and range of the latest torpedoes. Many battleships are now fitted with six to eight tubes for torpedoes of the largest size, power, and range.

TORPEDO NETS are fitted to nearly all battleships and large cruisers, but their efficacy is doubtful, and if armoring the bottom proves practicable they are likely to be dispensed with altogether, or much changed in design and method of application.

MACHINERY. Nearly all new battleships are fitted with turbine engines and watertube boilers. Many boilers are arranged for oil fuel alone or oil fuel as a supplement to the coal supply. The battleship *California* of the U. S. navy will have electrically driven propellers, and the new Italian battleships will have the central screw driven by Diesel oil engines, the other screws having steam turbine machinery.

BATTLE CRUISERS. The only battle cruisers commenced in 1914 were laid down by Germany, Austria, France, Italy, and the United States have not built any; English opinion seems to be in doubt about the class; and Russia had already laid down four which are the largest warships under construction. Great Britain and Italy are building battleships of 25 knots and it is possible that this compromise as to speed might have resulted in the elimination of the cruiser altogether, were it not for the fact that future battleships must possess greater defensive power against torpedoes. Such defense can only be obtained by a sacrifice of speed, gun power, or armor. Without sacrifice of active offensive strength, speed only can be reduced. It seems probable then that battleships of 20 knots or less, but well protected against torpedo attack, will soon appear, and that battle cruisers of high speed and moderate protection are likely to reappear unless the present war proves that the strategical principles, upon which the desirability for battle cruisers is based, are erroneous or inadequate.

BATTLESHIPS VS. SUBMARINES. On June 5, 1914, Rear Admiral Sir Percy Scott of the British navy, the foremost naval artillerist, wrote to the *London Times* on the subject of the "Submarine Menace." The main points of his letter were:

(a.) Submarines have done away with the utility of surface ships.

(b.) As no man-of-war will dare to come within sight of a coast that is adequately protected by submarines, battleships will not, in future, be able to:—

1. Attack ships that come to bombard our ports.
2. Attack ships that come to blockade us.
3. Attack ships convoying a landing party.

(c.) Nor will battleships be able to:

4. Bombard an enemy's ports.
5. Blockade an enemy's ports.
6. Blockade an enemy's fleet.
7. Convoy a landing force.

(d.) As there will be no enemy's fleet to attack when it is unsafe for any fleet to put to sea, this function of the battleship will cease to exist.

(e.) If we go to war we shall have to lock

our dreadnoughts up in some safe harbor if we can find one.

(f.) If, by means of submarines, we stop egress from the North Sea and Mediterranean, it is difficult to see how our commerce can be much interfered with.

(g.) Not only is the open sea unsafe, but in narrow waters and harbors surface ships are at the mercy of submarines.

(h.) What we require is an enormous fleet of submarines, airships, and aeroplanes, and a few fast cruisers, provided we can find a place to keep them in safety during war time.

While there is much important truth in Admiral Scott's letter, it is generally regarded by naval men as an exposition of the extreme view as to what may be the situation if the submarine continues to improve and the battleship finds no further means of protection against it. The present type of battleship may not long endure—it certainly will not if it is too vulnerable to any particular sort of attack, for it must change its character in order to meet that attack. But no matter what changes of form and design may be necessary, it will still be the *battleship*, the highest type of floating offensive power. It may even become a submarine vessel; but if so, its qualities of general offense must be enormously greater than any existing submarines.

Notwithstanding the apparently favorable conditions, the work of submarines in the present war is disappointing to their advocates. Of 93 ships destroyed (up to December 21), only 10 were sunk by submarines, while gunfire claimed 48, mines 27, torpedoes from large ships 2, and collisions 6. Torpedo boats and destroyers have caused no loss except through gunfire. At least eight submarines have been sunk and they have, so far as known, sunk no very important ship. That they will attempt much more is to be expected and they may do something to justify Admiral Scott's predictions; but at the end of 1914 the close blockade of the German and Austrian ports remains unbroken. See NAVAL PROGRESS; SUBMARINES.

BAUXITE. The production of bauxite, the raw material from which aluminum is made, was in the United States, in 1913, 210,241 long tons, valued at \$997,698—a marked increase over the production in any previous year in the history of bauxite mining. This increase is due in a large measure to the impetus in the aluminum industry. The States which produced bauxite are Alabama, Arkansas, Georgia, and Tennessee. Arkansas led in 1913. The production of Tennessee increased substantially, while that of Georgia and Alabama declined. Though new bauxite deposits are being found from time to time and though the present demand does not appear to tax unduly the known supply of the lower-grade material, the interest now being taken in the preparation of pure alumina from clay or other silicate minerals is worthy of note. As soon as a process for the production of alumina from clay is put on a commercial basis, large quantities of low-grade bauxite containing considerable admixtures of clay will become available. The chief uses of bauxite were first, as raw material in the production of metallic aluminum; second, in the manufacture of aluminum salts; third, in the manufacture of bauxite bricks; fourth, in the manufacture of

alundum for use as an abrasive; fifth, in the manufacture of calcium aluminate. See ALUMINUM.

BAYLES, GEORGE JAMES. An American educator and author, died Nov. 22, 1914. He was born in Irvington-on-Hudson, N. Y., in 1869, and graduated from Columbia University in 1891. In 1892 he received the master's degree, and in 1895 the degree of doctor of philosophy. From 1897 to 1903 he was lecturer at Columbia. He wrote extensively on the political and social sciences. His published writings include: *Civil Church Law, New Jersey* (1898), *New York* (1898), *Massachusetts* (1899); *Civil Church Law Cases* (1900); *Woman and the Law* (1901). He contributed to the *Annals of the American Historical Association on American ecclesiology*, and to the first edition of the *NEW INTERNATIONAL ENCYCLOPEDIA*. He was a member of several learned societies.

BEATTY, SIR DAVID. See WAR OF THE NATIONS.

BEATTY, WILLIAM HENRY. An American jurist, died Aug. 4, 1914. He was born in Lucas Co., Ohio, in 1838, and attended the University of Virginia from 1856 to 1858. In 1863 he removed to Nevada, where in 1864 he was appointed district judge, serving until 1874. He was appointed associate justice of the Supreme Court of Nevada in 1875, serving for three years. From 1879 to 1880 he was chief justice. He went to California and in 1889 was appointed chief justice of the Supreme Court of California for the term expiring 1915.

BEAUX-ARTS ARCHITECTS, SOCIETY OF. An association formed for the education of students in architecture. It comprises a system which includes the establishment, in different cities in the United States, of schools in which instruction in architecture may be obtained. This instruction is based on the instruction given in the *Ecole des Beaux Arts* in Paris. Many colleges and universities throughout the country avail themselves of the programme used by the society in its courses of instruction. Schools are formed in each city by groups of students who wish to carry on the study of architecture, instruction is given by a master or patron, whose work is given free, and the school is supported by contributions of the students. The committee on education of the society issues each year a certain number of programmes which include problems to be worked out by the different schools. These competitions are designated "Class A" and "Class B" competitions. During the season 1913-14 there were 1100 students registered in the society from 57 different cities. The society awards four prizes: The Warren Prize, offered for general excellence in planning a group of buildings; the Pupin Prize, for decorative treatment of some appliance; the Goelet Prize, for excellence in planning a city block; and the Bacon Prize, for the greatest number of honors obtained in "Class A." Mr. Bacon also offers each year a Paris prize, the winner of which is chosen to pursue studies in the first class in the *Ecole des Beaux Arts* in Paris. The Paris prize in 1913-14 was won by Harry Sternfeld, of the School of Architecture of the University of Pennsylvania. During the season 4106 preliminary sketches and 2926 rendered sketches were received.

BEAVER, JAMES ADDAMS. An American

public official, former Governor of Pennsylvania, died Jan. 31, 1914. He was born at Millers-town, Pa., in 1837, and graduated from Jefferson College in 1856. He studied law in 1858 and was admitted to the bar, beginning practice in the following year at Bellefonte, Pa. In 1861 he was commissioned second lieutenant in the Second Pennsylvania Infantry, and later in that year became lieutenant-colonel in the Forty-fifth Pennsylvania Infantry. In 1862 he was appointed colonel of the One Hundred and Forty-eighth Pennsylvania Infantry. He was brevetted for meritorious conduct, particularly for valuable services at Cold Harbor. He received wounds at Chancellorsville, Petersburg, and Ream's Station, and was honorably discharged from the service on Dec. 22, 1864. After the war he resumed law practice in Bellefonte. From 1880 to 1887 he was Major-General of the Pennsylvania National Guard. He was defeated for the Governorship in 1882, but was elected in 1887, serving until 1891. From 1896 to 1906 he was judge of the Superior Court of Pennsylvania and was reelected in the latter year to serve for the term ending 1916. He was a delegate to the Republican National Convention in 1880, and in 1888 and 1895 was vice-moderator of the Presbyterian General Assembly. He was a member of the President's commission for investigation of the War Department in 1898. For more than 25 years he was president of the board of trustees of the Pennsylvania State College and for one year he was acting president of that college.

BECKHAM, JOHN CREPPS WICKLIFFE. An American public official, elected in 1914 United States Senator from Kentucky to succeed Johnson N. Camden (q.v.), whose term expired on March 4, 1915. He was born in Bardstown, Ky., in 1869, and was educated at Central University, Ky. From 1888 to 1892 he was principal of the Bardstown High School. In 1889 he was admitted to the bar and began practice in 1894. From 1908 to 1911 he was editor of the *Kentucky State Journal*. He was elected a member of the Kentucky House of Representatives in 1894, was reelected in 1896, and in 1898 was Speaker of the House. In 1899 he was elected Lieutenant-Governor on the ticket with Governor Goebel, and upon the death of the latter on February 3, 1900, became Governor. He was elected Governor for successive terms from 1900 to 1907. In 1907 he was the unsuccessful Democratic nominee for United States Senator. He was nominated for Senator in the primaries of 1914 and in the following November was elected. See KENTUCKY.

BEER. See LIQUORS.

BELGIAN CONGO. See CONGO, BELGIAN.

BELGIAN RELIEF. See RELIEF FOR WAR VICTIMS.

BELGIUM. A constitutional monarchy of western Europe, lying between France and the Netherlands and bordering on the North Sea. The capital is Brussels, but during the European war in 1914 the government was removed first to Ostend and later to Le Havre, France.

AREA AND POPULATION. The area and *de jure* population by provinces, census of Dec. 31, 1910; the population as calculated Dec. 31, 1911; the percentage of increase in the population from 1831 to 1911; and the density per square kilometer according to the census of 1910 are shown in the table following:

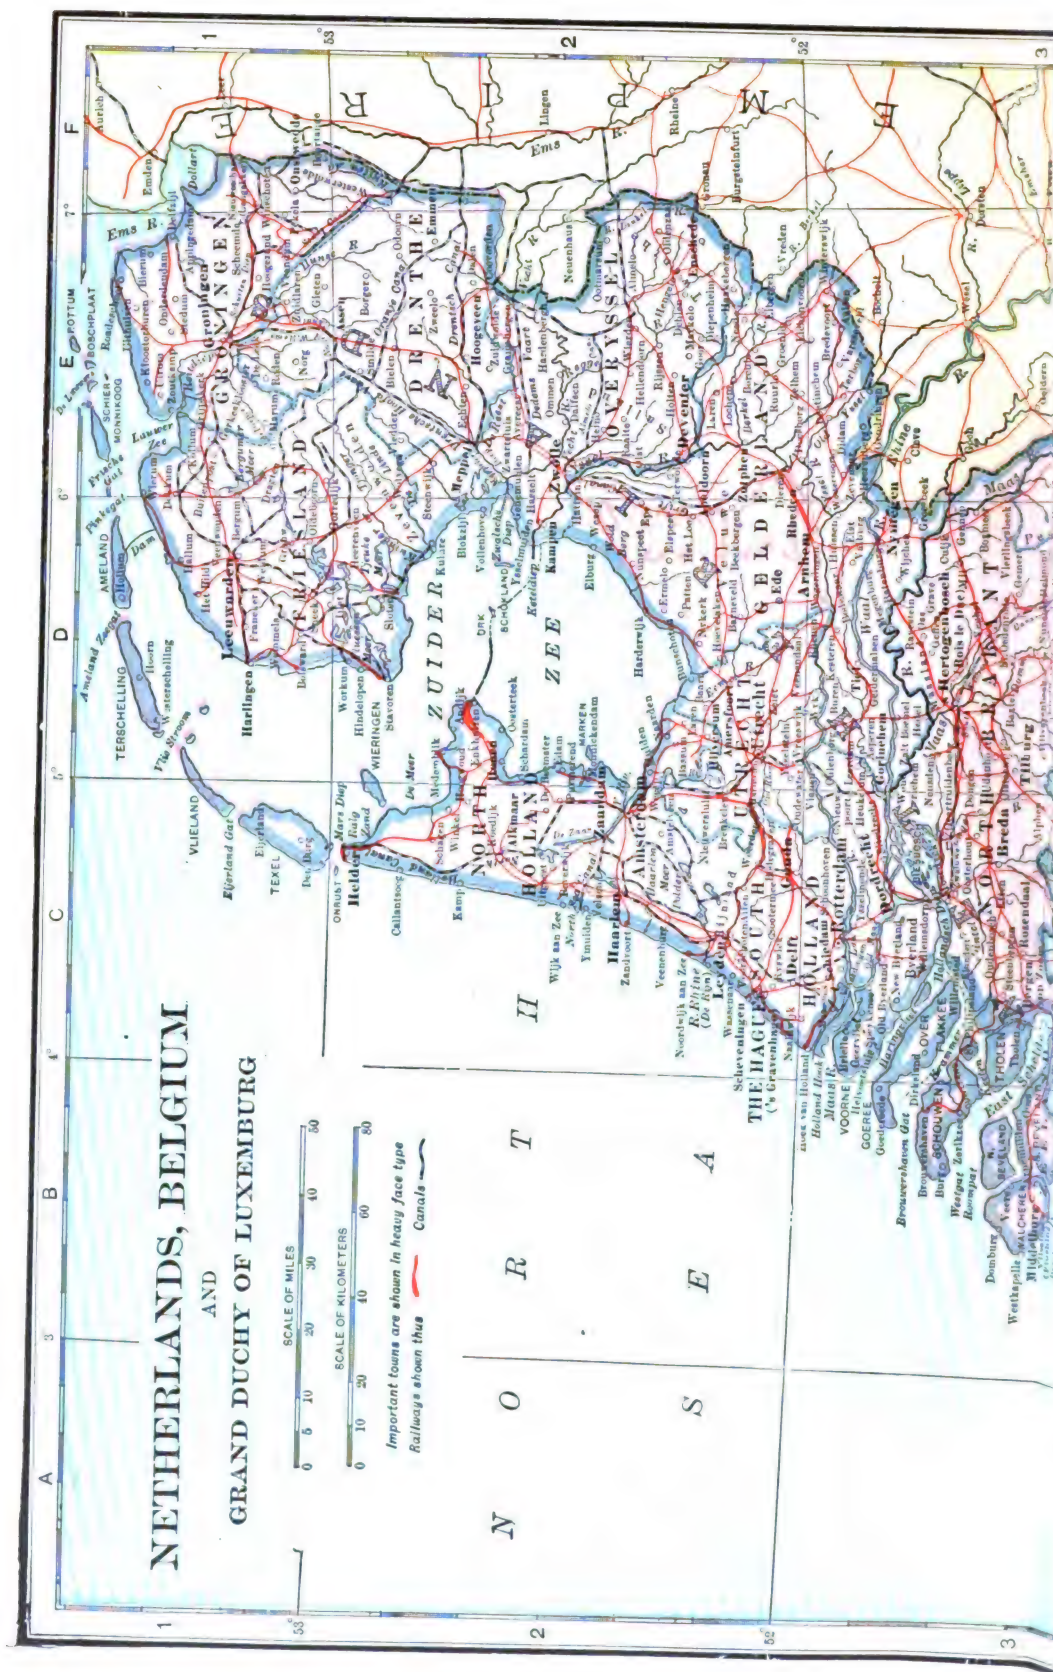

Provs.	Sq. km.	Pop. 1910	1911	Per cent increase 1831-1911	Density sq. km. per
Antwerp	2,882	968,677	987,201	182.10	348
Brabant	8,283	1,469,677	1,494,416	165.99	455
W. Flanders	8,234	874,185	878,417	44.42	272
E. Flanders	3,000	1,120,835	1,125,814	51.53	375
Hainaut	3,722	1,282,867	1,289,712	102.18	333
Liège	2,895	888,341	890,918	137.56	308
Limbourg	2,408	275,691	279,170	74.38	116
Luxemburg	4,418	281,215	281,814	48.89	52
Namur	3,660	362,846	363,449	70.01	99
Total	29,451*	7,423,784	7,490,411	97.85	254
<i>De facto</i>		7,416,454			

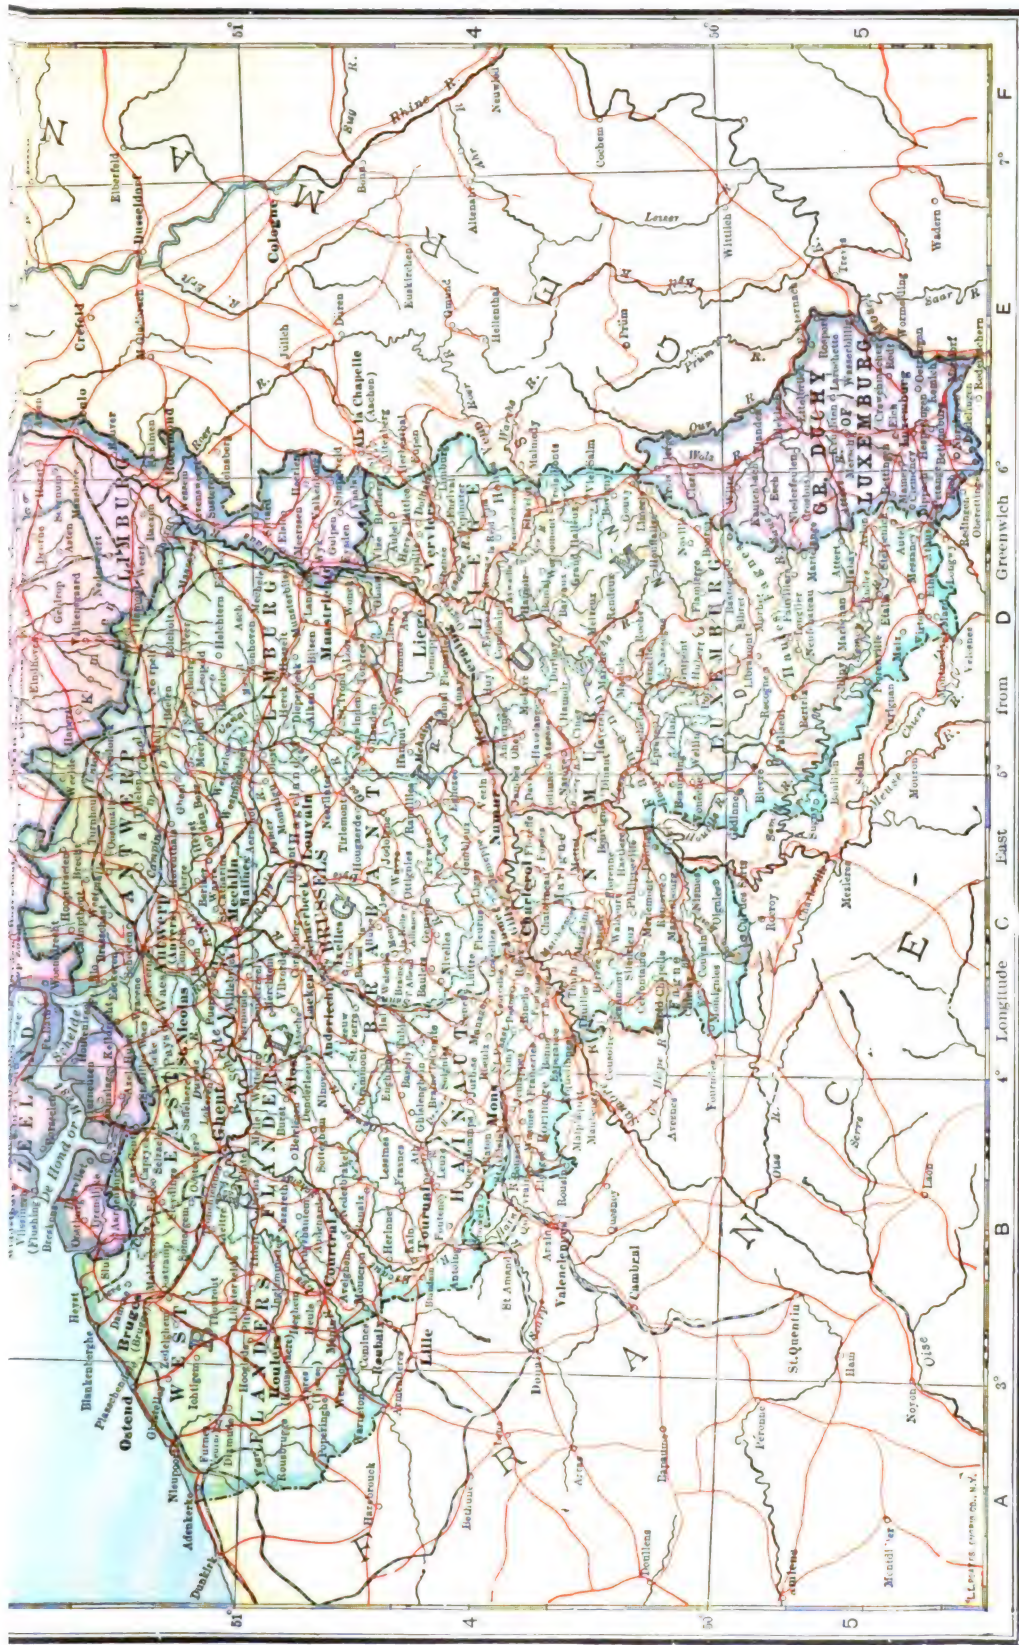

* 11,871 square miles.

Of the total population in 1910, 3,680,790 were males, and 3,742,994 were females. The census of 1900 returned 6,693,548, and that of 1880 returned 5,520,009. Since 1856 the population shows an augmentation of 63.90 per cent. The augmentation during the decade 1900-10, due to excess of births over deaths, was 717,562, and that due to excess of immigration over emigration was 12,673. Of the total population in 1910, 2,833,334 spoke French only, 3,220,662 Flemish only, 31,413 German only, 871,288 French and Flemish, 74,993 French and German, 8652 Flemish and German, and 52,547 all three languages. In addition there were 330,893 inhabitants, including children over two years, speaking no one of the three languages. The number of marriages in 1911 was 59,370; births, 171,802; deaths, 122,843; still births, 7557; immigrants, 41,062; emigrants, 33,007. The population of Antwerp as calculated Dec. 31, 1911, was 308,618 (with suburbs, 407,773); Brussels, 176,947 (737,432); Liège, 167,676 (243,865); Ghent, 166,715 (211,081); Schaerbeek,* 85,399; Ixelles,* 76,405; Molenbeek-St.-Jean,* 74,857; St.-Gilles,* 66,592; Anderlecht,* 64,425; Malines, 59,191; Bruges, 53,484; Borgerhout, 50,583; Verviers, 46,485; Ostend, 42,638; Louvain, 42,307; Seraing, 41,389; Tournai, 37,198; Courtrai, 35,872; Laeken, 35,714; Alost, 35,272; St.-Nicolas, 34,881; Etterbeek, 33,779; Namur, 32,444; St.-Josse-ten-Noode, 32,282; Berchem, 30,996; Charleroi, 28,891; Uccle, 28,127; Jumet, 28,020; Mons, 27,904; Lierre, 25,985; Forest, 25,671; Roulers, 25,488. The asterisks mark faubourgs of Brussels. The four cities of Antwerp, Brussels, Ghent, and Liège, with their environs, contain 21.16 per cent of the population of the kingdom; but the appearance of urbanization induced by these figures is offset by the fact that the dependent communes cover areas with boundaries widely separated from the urban centres; within these confines are areas devoted to agriculture.

EDUCATION. Of the censused population in 1910, the proportion above eight years of age who could neither read nor write was 13.1 per cent; in 1900, 19.1; in 1890, 25.0; in 1880, 30.26. Of the 67,396 youths called for military service in 1913, 4207 (9.24 per cent) could neither read nor write.

Schools are maintained by communal taxation with provincial and State grants, and a law to make primary education compulsory was under consideration in 1914. There are many schools under ecclesiastical control, and this condition is a source of grievance to the Liberal and Socialist parties. There were 7590 public primary schools in 1911, with 934,830 pupils; 3186 in-

fant schools, with 275,911; 4940 adult primary schools, with 246,292; 57 primary normal schools, with 4967. There are both State and private secondary schools, and special, technical, and fine arts institutions, besides four universities, two State and two free, with a total attendance in 1911-12 of 2100.

Although the majority of the population are Roman Catholics, full religious liberty prevails. The State contributes to the support of the clergy of all denominations.

AGRICULTURE. The total area returned as agricultural (1895) was 2,607,514 hectares, of which 1,916,890 hectares were under crops, 521,495 under forests, and 169,329 uncultivated. The agricultural area was diminished during the period between 1880 and 1895 by 97,443 hectares, and the diminution has since steadily continued. The area under main crops declined from 1880 to 1895 by 66,880 hectares, while the area under forests was increased by 32,072 hectares. To the cultivation of cereals there were devoted 934,663 hectares in 1880 and 809,691 hectares in 1895; legumes, 33,093, and 26,325; industrial plants, 64,150, and 51,642; potatoes, 199,357, and 184,691. Sugar-beet cultivation increased from 32,627 hectares in 1880 to 54,099 hectares in 1895; roots, from 36,153 to 53,801; forage plants, from 574,881 to 637,907. A further decline in cereal cultivation is notable in 1911—744,782 hectares; legumes, 13,575; forage plants, 386,472. Industrial plants increased to 74,348. The number of persons engaged in agricultural pursuits constantly decreases; in 1864, 24.98 per cent of the population was so engaged; in 1880, 21.77; in 1895, 18.70.

In the table below are shown areas devoted to main crops and production for two years (1913-14 subject to revision) with production per hectare in 1912-13:

	Hectares		Quintals		Qs. per ha.
	1913-14	1912-13	1912-13	1912-13	1912-13
Wheat	159,494	161,817	4,019,505	3,802,699	25.2
Rye	...	66,000	...	528,000	...
Barley	34,033	34,123	918,088	921,321	27.0
Oats	271,694	277,694	6,960,945	7,220,044	25.6
Flax	23,138	...	98,236†	...	4.2
Beets*	52,419	52,688	13,919,175	...	265.5
Tobacco	4,023	4,172	89,869	...	22.2

* Sugar beets. † Seed; fibre production, 178,884 quintals.

In the table below is shown the number of live stock on farms for comparative years:

	1880	1895	1913	1913
Horses	271,974	271,527	262,709	267,160
Cattle	1,382,815	1,420,976	1,830,747	1,894,484
Sheep	865,400	285,722
Swine	646,375	1,168,183	1,348,415	1,412,298

Of the horses in 1913, 3575 were stallions of three years and over and 12,808 under three years; 119,154 and 50,891 mares; 48,959 and 22,773 geldings. Of the cattle, there were 12,014 bulls two years and over and 11,545 under two years; 936,800 milch cows; 29,497 oxen; 91,223 fat and 102,210 unfattened steers; 534,177 heifers, and 132,018 steer calves. The swine included 3963 boars, 146,165 sows, 515,491 fat stock, and 746,674 young pigs.

MINING AND METALS. The number of conceded coal mines in 1911 was 216, of which 127

were in operation; total area, 172,069 hectares; total output, 23,053,540 tons, valued at 340,279,000 francs. Coal mines in 1912 numbered 209, of which 126 were in operation, with 145,670 laborers, producing 22,972,000 tons, valued at 380,444,000 francs. In the table below are shown output in tons and value in francs of output of the metallic mines for four years.

	1880	1900	1910	1911
Iron:				
Tons	253,499	247,890	122,960	150,500
Francs	1,875,000	1,820,100	566,950	766,400
Pyrites:				
Tons	7,918	400	214	122
Francs	164,000	1,140	1,900	900
Calamine:				
Tons	15,735	3,000	3	...
Francs	696,000	217,150	200	...
Blende:				
Tons	23,080	5,716	1,434	886
Francs	1,546,370	389,180	139,600	14,250
Lead:				
Tons	5,434	230	152	82
Francs	892,000	63,280	26,450	14,250
Manganese:				
Tons	700	10,820	6,270	...
Francs	4,000	180,350	106,200	...

Iron ore to the value of 8,231,724 francs was imported from Luxemburg in 1911, and 9,165,390 francs in 1912. The product of the zinc industry in 1911 was 198,230 tons, valued at 124,009,000 francs; of the lead industry 44,308 tons, valued at 15,572,000 francs.

The output from steel and iron works, tons and value, is shown in the table below for comparative years.

	1910	1911	1912
Pig Iron:			
Tons	1,852,090	2,046,280	2,031,290
1000 francs	120,761	133,664	160,836
Mfrd. Iron:			
Tons	299,500	290,270	332,750
1000 francs	39,494	37,487	40,025
Steel Ingots:			
Tons	1,892,160	2,192,680	2,515,040
1000 francs	161,606	201,705	242,377
Steel Rails, etc.:			
Tons	1,334,550	1,654,960	1,903,270
1000 francs	192,220	210,370	257,819

The quarries numbered 1550 in 1912, with 35,532 work people, output valued at 69,758,300 francs.

OTHER INDUSTRIES. The chief source of the country's wealth is its manufacturing industries, which, according to the industrial census of 1896, numbered 337,395 enterprises and branches. Of these, 236,000 were permanent establishments, distributed as follows: 165,000 (70.08 per cent) home industries employing no work people; 54,500 (24.09) small enterprises employing one to four workers; 14,800 (5.12) establishments employing five to 49 workers; 1500 (0.63) establishments employing 50 to 449 workers; 200 (0.08) great industries employing 500 or more workers. The census returned 169,778 persons engaged in the textile industry, 137,966 in clothing factories, 134,333 in metal works, 128,313 in mines, 93,577 in construction work, 90,443 in factories for the manufacture of food stuffs, 88,457 in timber and allied industries, and 57,702 in leather factories. There were in operation in 1911, 89 sugar works, output 234,764 tons of raw sugar; 21 sugar refineries, output 121,226 tons; 125 distilleries, output 73,864 kiloliters of alcohol at 50° G.L.;

output of the breweries was 1,703,159 kiloliters; of the tobacco manufactories, 10,141 tons. The fisheries products for 1911 were valued at 6,381,939 francs. The output of the glass factories (1900) was valued at 65,912,000 francs. The number of strikes in 1911 was 156, involving 54,947 strikers; 1906-10, 756, involving 121,416; 1901-05, 474, involving 149,987.

COMMERCE. Imports for consumption and exports of domestic produce are shown in the table below, together with transit trade, for successive years, in thousands of francs.

	1906	1910	1911	1912
Imports	3,454,000	4,265,000	4,508,500	4,958,000
Exports	2,798,800	3,407,400	3,580,300	3,951,500
Transit	2,268,800	2,287,200	2,298,900	2,437,300

The details of the special trade in 1912 and 1913, as compared with 1908, are given in thousands of francs in the table below:

Imports	1908	1912	1913
Wool	163,554	428,629	410,198
Wheat	388,820	401,908	898,186
Cotton	51,492	211,927	210,420
Lead	22,599	29,495	29,067
Raw hides	110,265	179,818	189,156
Coal	103,508	148,409	161,957
Corn	75,884	139,047	110,425
Rubber		134,654	145,235
Flax	62,020	108,920	100,673
Beer		11,422	13,078
Barley, etc.	59,150	91,733	73,018
Coffee	65,204	86,663	92,830
Seeds		143,656	172,725
Building wood		123,074	124,505
Jute		17,617	14,673
Pig iron		58,449	43,323
Machinery	72,609	97,595	107,036
Oil cake		53,318	56,309
Copper	34,238	47,902	42,032
Chemical products	108,325	120,568	141,696
Petroleum (refined)	45,792	45,008	42,108
Dyes and colors	70,637	57,200	65,289
Wine		35,915	40,842
Exports	1908	1912	1913
Wool	82,596	896,001	850,497
Flax	82,144	140,375	132,823
Flax yarns		131,018	114,402
Zinc	74,126	120,017	93,499
Raw hides	82,309	119,732	112,884
Vehicles		119,821	94,884
Rubber		109,945	109,249
Iron and steel	197,305	262,149	251,315
Wheat	138,190	93,612	73,126
Coal	113,331	92,309	90,220
Cotton	54,909	92,882	84,348
Vegetable oil		43,512	31,206
Copper	20,686	29,819	32,771
Machinery	193,567	94,250	77,112
Oil cloth		2,441	2,854
Window glass		48,225	45,741
Dyes and colors	36,861	62,249	68,127
Corn		44,071	24,880
Lead	23,081	32,191	34,712
Horses	28,203	37,831	40,894
Wool yarns	36,069	61,868	65,092
Chemical products	57,660	83,285	93,601
Paper		38,687	37,288

The principal countries of origin and destination with the value of their trade for two years are shown in the table below, values in thousands of francs:

	Imports		Exports	
	1912	1911	1912	1911
France	738,761	908,048	695,105	752,314
United States	341,423	413,829	113,982	145,128
United Kingdom	436,220	505,646	498,187	594,625
Netherlands	298,217	356,573	352,846	367,599
Germany	602,398	703,120	959,331	1,007,469
British India	267,614	249,551	34,967	40,389
Russia	318,136	272,827	66,904	83,496
Rumania	245,239	200,962	24,283	17,771

	Imports		Exports	
	1912	1911	1912	1911
Argentina	272,328	305,524	83,661	17,981
Sweden	41,464	39,144	12,739	16,212

Chile	80,595	65,936	20,877	25,965
Egypt	8,150	12,779	24,503	29,025
Switzerland	14,620	18,471	51,598	52,162
Belgian Congo	57,675	60,945	26,552	29,258
Austria-Hun.	12,568	13,995	38,626	46,124

COMMUNICATIONS. At the end of 1912 there were 4719 kilometers of railway in operation, of which 4369 were operated by the State. Local lines, 3855 kilometers. The Belgian railway lines, as a result of the war, naturally came into the possession of the German authorities and were operated by them regularly after November 19. They constituted three railway administration departments with headquarters at Brussels, Charleroi, and Libremont. At the end of the year new trains had been added to a service somewhat disorganized and regular traffic was maintained between Brussels and Antwerp, though the time of the journey was still about two hours. It was reported late in the year that the employees on the Belgian railways had gone on strike and refused to work for the Germans, many having departed for England, and others having sought work on French railways. There were 7975 kilometers of telegraph lines and 43,547 of wires; in addition there were 520 kilometers of wires installed at the expense of private railway companies. There were 1659 telegraph stations, 1 wireless station, and 20 on board vessels. Urban telephone wires, 233,086 kilometers; interurban wires, 29,434. Post offices, 1708. The merchant marine included at the end of 1912, 97 steamers, of 174,021 tons, and 8 sailing vessels, of 7616 tons. Vessels entered in the 1912 trade, 11,230, of 16,353,933 tons; cleared, 11,214, of 16,319,056 tons.

FINANCE. The franc, worth 19.3 cents, is the unit of value. In the table below are given, in thousands of francs, receipts ordinary (A) and extraordinary (B) and ordinary and extraordinary expenditure for four years:

	1908	1909	1910	1911
Rev. A	616,986	645,107	682,487	695,252
Rev. B*	829	1,052	5,724	1,019
Total rev.	617,815	646,159	688,211	596,271
Expend. A	613,021	634,456	672,954	689,166
Expend. B	157,430	151,747	156,502	121,761
Total exp.	770,451	786,203	829,456	810,927

* Exclusive of loans.

The 1914 budget is detailed in the table below, amounts in thousands of francs:

Revenue	1000 fr.	Expend.	1000 fr.
Property taxes	30,862	Public debt	217,503
Personal taxes	27,257	Civil list, dotations	5,614
Trade licenses	9,500	Ministries:	
Tax on incomes	18,000	Justice	82,248
Motor cars	1,500	Foreign affairs	5,127
Cinemas	500	Interior	7,979
Mines	29	Sciences and arts	43,179
Customs	72,031	Industry	26,873
Excise	94,703	Railways	246,484
Various	1,652	Marine, posts, tels.	54,693

Revenue1000 fr.	Expend.1000 fr.
Registration, etc. 49,100	War and gendar-
Succession 32,100	marie101,096
Stamps 14,500	Finance 26,544
Fines, etc..... 8,018	Public works and
Rivers, etc. 8,890	agriculture .. 85,189
Railways862,800	Colonies 1,448
Tel. & Tel. 28,585	Repayments, etc... 2,826
Post offices 27,950	Total806,754
Steamboats 2,210	
Domains, etc.... 5,590	
Various 28,179	
Repayments 9,609	
Total807,818	

The total debt stood Jan. 1, 1913, at 3,739,133,738 francs—219,959,632 fr. share of the Netherlands debt at 2½ per cent, and 3,519,174,106 fr. loans at 3 per cent. The greater part of the debt was raised for public works, and the interest is more than covered by the revenue from railways alone.

GOVERNMENT. The king is the executive, aided by a responsible ministry. The legislative power is exercised conjointly by the king and a parliament made up of two houses—a senate and an elective chamber of representatives. The reigning sovereign in 1914 was Albert Leopold, born April 8, 1875, son of the late Prince Philip of Saxe-Coburg and Gotha and of Flanders, and of the late Princess Marie of Hohenzollern-Sigmaringen. He succeeded his uncle, Leopold II, Dec. 23, 1909. On Oct. 2, 1900, he married Elizabeth, Duchess of Bavaria; they have three children, Leopold Philip, born Nov. 3, 1901 (heir-apparent), Charles Theodore, born Oct. 10, 1903, and Marie José, born Aug. 4, 1906.

The senate and chamber meet annually in the month of November, and must sit for at least 40 days; but the king has the power of convoking them on extraordinary occasions, and of dissolving them either simultaneously or separately. In the latter case a new election must take place within 40 days, and meeting of the chambers within two months. Money bills and bills relating to the contingent for the army originate in the chamber of representatives.

The senate in 1913 included 70 Catholics, 35 Liberals, 15 Social Democrats. The chamber of representatives in 1913 included 101 Catholics, 44 Liberals, 39 Social Democrats, and 2 Christian Socialists.

The executive government consists of 11 departments, under the following ministers:

Ch. de Broqueville (appointed Nov. 11, 1912), president of the council and minister of war; P. Poulet (appointed June 17, 1911), minister of sciences and arts; Paul Berryer (appointed Sept. 5, 1910), minister of the interior; M. Levie (appointed June 17, 1911), minister of finance; G. Helleputte (appointed Nov. 11, 1912), minister of agriculture and of public works; M. J. Davignon (appointed May 2, 1907), minister of foreign affairs; H. Carton de Wiart (appointed June 17, 1911); J. Renkin (appointed Oct. 30, 1908), minister of the colonies; M. A. Hubert (appointed May 2, 1907), minister of industry and labor; A. Van de Vyvere (appointed Nov. 11, 1912), minister of railways; P. Segers (appointed Nov. 11, 1912), minister of marine and of posts and telegraphs. The ministry of marine was created in November, 1912.

By the treaty of London, Nov. 15, 1831, the neutrality of Belgium was guaranteed by Austria, Russia, Great Britain, and Prussia.

ARMY. The army of Belgium was organized on the principle of universal service, by the law of Aug. 30, 1913, which substituted new conditions for those established by the law of Dec. 14, 1909, but affirmed the general principle of the former legislation. On a peace basis in 1913 the Belgian army consisted of three cavalry brigades and six infantry divisions, with artillery, engineers, medical services, supplies, and transport, cyclist and air-craft companies. In case of war it was proposed to double the infantry strength by forming second battalions. The military situation of Belgium was realized in 1912, when the necessity of strengthening the army was brought before the legislature, and the Premier, Monsieur de Broqueville, in November of that year, referring to the guarantee of Belgian interests and neutrality by Great Britain in the treaty of 1899, showed that the groupings of the great powers of Europe had resulted in alliances and ententes, which might in case of war "remove from the guarantee the value, which the neutrality of the guarantor alone could assure." This involved the provision of an adequate army to protect Belgian neutrality and the integrity of the country against possible invasion, and during 1914 reorganization was in progress under the terms of the law of the previous year. There was also involved the strengthening of the permanent fortifications at Antwerp in 1913. There were being installed 145 armored turrets in the new chain of detached forts, of which 63 were armed by Cockerill, who was providing in the first advance line 15 turrets, with 15 c.m. (9 inch) guns, 28 with 12 c.m. (4.7 inch) mortars, 14 with 7.5 c.m. (2.9 inch) guns, and 6 with 5.7 c.m. (2.24 inch) guns. Fifty per cent of the first line were armed with 2.9 inch guns, and 32 others also by guns from other ordnance works. These latter turrets were of slighter construction and were not furnished with electrical plants. The Belgian artillery employed a standard field gun of Cockerill design, with a calibre of 2.95 inches, and large calibre guns were installed in the coast defenses and in the armed cupolas. The rifles, carbines, and revolvers were made for the most part in the Liège district, including the "Fabrique Nationale d'Armes de Guerre" at Herstal, a suburb of Liège.

The Belgian army, previous to the outbreak of the war, benefited materially by the army reform legislation of 1913, and even in the few months that the new organization was in progress much was accomplished. In 1913 the peace establishment was 3542 officers and 44,061 men. The principle of universal military service in Belgium had been accepted, and the peace strength increased, while at the same time a rapid mobilization of the individual units was arranged, so that these could be brought up to strength within 24 hours, by collecting men, horses, material, ammunition, etc., within their own districts. Before and during the war, these plans were carried out with considerable success, and the military speed manifested by the people and their willingness to bear the additional burdens imposed by the legislation of 1913 proved of considerable advantage.

HISTORY. Immediately after reassembling in January, the chamber took up the school bill, which had already been made the subject of heated partisan debates. In this bill it was proposed that State grants in aid of education

should be extended on equal terms to all schools which complied with certain requirements, whether taught by laymen or by religious orders. This plan, the government contended, would do much to lessen illiteracy, and would redress the grievance of the Catholics, who complained that the Catholic schools under the existing system received little or no aid from the state, whereas the lay or nonreligious schools were subsidized from the public funds toward which Catholics as well as others must contribute. Under Premier de Broqueville's plan, the state, granting \$120 a year for each class conducted by a male teacher and \$100 for each class taught by a woman, would relieve the communes of three-quarters of the increased expenditure, and instruction would be made free and compulsory for all children up to the age of 14. All schools would be subject to medical inspection. The Socialists and Liberals, however, bitterly protested against the granting of subsidies to Catholic schools. According to their view this would be granting public money for denominational purposes, and therefore unconstitutional. They maintained, moreover, that the state ought not to support Catholic teachers who would inculcate doctrines opposed to Liberal and Socialist views. This criticism was crystallized into an amendment, which would prohibit any instructor in any state-subsidized school from attacking the political, religious, or philosophical principles of the families of its pupils. The Catholics opposed such an amendment, seeing in it an indirect attempt to eliminate all religious teaching from education. The bill was passed, without radical amendment, by the Catholic majority in the chamber on February 18, and in the senate on May 15; on both occasions the Liberals and Socialists walked out in a body as a manifestation of their displeasure.

Elections were held on May 24 to renew the representation in the chamber of four provinces out of nine: Hainaut, East Flanders, Liège, and Limbourg. The electoral campaign was more quiet than the one in 1912; for whereas in the 1912 election Liberals and Socialists had attempted to combine against the government, hoping to secure a majority of the Left, in 1914 the two Opposition parties were no longer in alliance and had not the slightest hope of overturning the Catholic party which had governed Belgium for 30 years, liberalizing the constitution, reorganizing the national defense, establishing universal education, and working out a code of enlightened social legislation. In attacking the government, the Opposition relied primarily on the question of electoral reform. The electoral reform commission appointed by the government in 1913 worked in secret, and was considering only the suffrage for the election of provincial and communal councilors; therefore the advocates of "one man one vote" had a genuine grievance against the government. Dissatisfaction also took root in the ministerial financial policy, which, the Opposition alleged, involved too much borrowing. Finally, the question of Old Age Pensions played an important part in the electoral contest. In order to amend the present inadequate system of voluntary contribution (toward Old Age Pensions) supplemented by state subsidies, the government proposed to extend the principle of obligatory insurance

against old age—which as yet had been applied only to colliery workers—to all workers earning less than 2400 francs a year. The ministerial measure also provided obligatory insurance against sickness and premature incapacity, with contributions by worker, employer, and state. The Socialists would have placed solely on employer and state the burden of pensions, and would have done away with the mutual insurance societies, which were not infrequently presided over by the local *curé*. The elections, which took place on May 24, resulted in a gain of 2 seats for the Liberals, and of 1 for the Socialists, so that the new Chamber included 99 Catholics, 46 Liberals, 40 Socialists, and 2 Christian Democrats. See also *INTERNATIONAL ARBITRATION AND PEACE, Bryan-Wilson Treaties*.

BELGIUM AND THE WAR. On the evening of August 2, the German minister at Brussels handed to the Belgian government an ultimatum demanding that German troops should be allowed free passage through Belgium into France. In consequence of the Belgian government's indignant refusal to permit what it regarded as a violation of Belgium's neutrality, a German invasion of Belgium was immediately begun. The causes leading up to this event, and the details of the subsequent military operations on Belgian soil, are treated in the article on the *WAR OF THE NATIONS* (q.v.). In the face of this national disaster, and in an unparalleled outburst of national patriotism, even the most fundamental party differences and social distinctions were put aside. "Irreconcilable" Socialists sprang to the support of their king, and the Socialist leader, M. Vandervelde, entered the Clerical cabinet, August 4. Forty millions were voted for defense at the war session of Parliament, August 3-4. Later in August, France and England agreed to advance Belgium \$50,000,000 apiece for the prosecution of the war. In spite of the heroic Belgian resistance, the German armies entered Brussels on August 20, and rapidly overran the greater part of the kingdom. The Belgian government offices had already been moved from Brussels to the strongly fortified town of Antwerp. Thence the government fled to Ostend, then to Havre, in France, while the Germans besieged and captured Antwerp. King Albert spent much of the time with his army, but made visits to London and Paris. The actual ruler of Belgium, however, was Field Marshal Baron von der Goltz, appointed German Military Governor of Belgium on August 26. Heavy requisitions, mostly of money, were made by the German military officials upon the conquered Belgian cities. In December the refusal of the German government to recognize the exequaturs of foreign consuls in Belgium was interpreted in some quarters as an indication that Germany intended to annex Belgium, but the *Norddeutsche Allgemeine Zeitung* explained the step as the consequence of the fact that some three hundred now hostile Belgians had hitherto held posts as consuls for allied or neutral states. The menacing advance of the German armies, the destruction of Belgian towns, the devastation of the country, and the general paralysis of productive industry all helped to plunge the Belgian nation into the deepest misery. To the grief of the women who had sacrificed their husbands and sons, was added the despair of the old people who had been compelled to forsake their homes, and the sufferings of the fatherless

children who lacked for food. Thousands of Belgians fled to France, England, and America. Many more remained in the Belgian cities, destitute. For their relief generous contributions were made by allied and neutral nations. Even from distant Australia came material aid. From the United States came substantial financial contributions, and a "Christmas Ship" laden with toys for the children. The sympathetic interest with which the plight of Belgium was regarded in the United States was doubtless heightened by the mission sent by the King of Belgium to the United States. Four members of the Belgian cabinet—M. Henry Carton de Wiart, M. Hymans, M. De Sadeleer, and M. Vandervelde, accompanied by Count Louis de Lichtervelde, visited the United States in September. On September 16, M. Carton de Wiart, in the name of the mission, delivered an address to President Wilson, alleging that the German armies had invaded Belgium without just cause, and had perpetrated revolting atrocities upon the Belgians in gross violation of the rules of civilized warfare. For further information in regard to the conduct of the war in Belgium, consult the article on **THE WAR OF THE NATIONS**.

BELGIUM, COMMISSION FOR RELIEF IN. See **RELIEF FOR WAR VICTIMS**.

BENEDICT XV (GIACOMO DELLA CHIESA). Elected 260th Pope, to succeed Pius X, on Sept. 3, 1914. He was born in Pagli, in the diocese of Genoa, Nov. 21, 1854. His father was Giuseppe, Marchese Della Chiesa, a nobleman of considerable wealth. The fact that he was of noble birth and wealthy parents made possible a thorough grounding in his boyhood studies, and having decided to study for the priesthood, his preparatory studies were made in the local schools at Genoa and he then took a degree in jurisprudence at the University. In 1876 he entered the Capranican College at Rome, and finally became a student at the Academy of Noble Ecclesiastics, a Roman institution which in older days of class distinction included only students of aristocratic birth, but is now open to others. His theological studies were completed in the last days of Pope Pius IX, and he was ordained to the priesthood in 1878, when he was 25 years of age. He had been a priest only five years when his promising activities came to the notice of his superiors, and in 1883 he left Italy to accompany the then Archbishop Rampolla to Madrid as secretary of the Nunciature. When Rampolla was made a Cardinal by Pope Leo XIII, and returned from Spain to Rome in 1887 he brought his young assistant back with him. The young priest's labors in Madrid made him a permanent Under Secretary of the Secretariate of State. Here as in Madrid he held the confidence of Cardinal Rampolla. After the accession of Pope Pius X, he remained at his post and the new Pope and his Secretary of State, Cardinal Merry del Val, were quick to recognize the qualities which had come so early to the notice of Pope Leo and Cardinal Rampolla. Father Della Chiesa was in turn made a prelate on July 18, 1900; consultor of the holy office on May 30, 1901, and Archbishop of Bologna on Dec. 16, 1907. When the Society of St. Jerome for the Spread of the Gospels was established at Rome, in 1902, he was its first president and its meetings were held at his residence. One of his first acts after his election as Pope was the sending to its then

president, Cardinal Cassetta, on Oct. 8, 1914, a letter commending the work of the society and encouraging the spread of the Scriptures. At the time of his appointment to this office it was said that he had been chosen for the office as the best man available to combat the religious radicalism in a region recognized as the headquarters of the Modernist National Democratic League. Although little is known of his work at Bologna outside of Italy, his fame for successful achievement of notable work was widespread at home, and his care of the poor in the diocese won for him their great affection. After seven years of administrative work at Bologna he was elevated to the College of Cardinals at the Consistory on May 25, 1914. Cardinal Della Chiesa had become known as a man of diplomacy, a cool and level-headed leader, and the possessor of an even temper, who could face emergencies dispassionately. He is of the school of Cardinal Rampolla, with a keen reverence for all the traditions of the Vatican, and a foe of all that has to do with so-called Modernism in the Church. His scholarly attainments are high and he has a wide knowledge of modern conditions in all parts of the world. He was chosen Pope on the ninth ballot of the Conclave. He at once took the name of Benedict XV, it is supposed because of the intellectual excellences of Benedict XIV, who was elected Pope in 1740 and who was born in Bologna and was many years Archbishop of that See. He was crowned Pope on Sept. 8. His first encyclical, issued Nov. 1, 1914, called for renewed efforts to spread religion throughout the world and urged peace and brotherhood among peoples and nations in fear of God. "The immense spectacle of a general war," he says, "has struck us with unutterable horror and sadness." Benedict XV speaks English. He is dark complexioned, with a firm mouth, square forehead, and keen lustrous eyes. He is about the ordinary standard in height and moves and walks with great dignity. He is a thoughtful and highly gifted man of affairs.

BENEFACTIONS. See **GIFTS AND REQUESTS**.

BENJAMIN, SAMUEL GREENE WHITTLE. American author, artist, and diplomat, died July 20, 1914. He was born at Argos, Greece, in 1837, the son of a missionary in Asia Minor. He attended the English College at Smyrna and graduated from Williams College in 1859. From 1861 to 1864 he was assistant librarian in the New York State Library. During the Civil War he sent two companies of cavalry to the front and served in war hospitals. During the following years he read law, studied art, and for several years was at sea engaged in the mastering of seamanship. From 1883 to 1886 he was United States Minister to Persia, and was the first minister sent by the United States Government to that country. He served as art editor for several magazines, and in 1870 opened a studio as an artist in oil and water colors in Boston. He exhibited at many exhibitions and received several medals. He was a prolific writer and his published works include: *Constantinople, Isle of Pearls and Other Poems* (1861); *The Turk and the Greek* (1867); *Contemporary Art in Europe* (1877); *The Atlantic Islands* (1878); *Art in America* (1879); *Troy, Its Legend, Literature and Topography* (1881); *Persia and the Persians* (1886); and, *The*

Story of Persia (1887). He also wrote much for magazines and reviews.

BENNETT CUPS. See **AERONAUTICS.**

BENSON, ROBERT HUGH. An English Roman Catholic priest and writer, died Oct. 19, 1914. He was born at Wellington College in 1871, and was educated at Eton and at Trinity College, Cambridge. Father Benson was the son of the Archbishop of Canterbury and a brother of E. F. and A. C. Benson, both well-known writers. After his graduation from Trinity College he acted for a time as curate in the Eton Mission at Hackney Wick, and at Kemsing. In 1898 he became a member of the Anglican Community of the Resurrection at Mirfield, and was received into the Roman Catholic Church in 1903. In the following year he was ordained a priest. After reading for a year at Cambridge he was appointed an assistant priest, and in 1911 became private chamberlain to Pope Leo X at Rome. He acquired considerable fame as an author and as a lecturer. In the Lenten season of 1914 he delivered a series of lectures at the Church of Our Lady of Lourdes, which attracted much attention. He was a frequent visitor to the United States. He was a prolific writer and among his many publications are: *The Light Invisible*; *The Queen's Tragedy*; *The Sentimentalists*; *The Religion of the Plain Man*; *St. Thomas of Canterbury*; *Non-Catholic Denominations*; *The Coward*; *The Friendship of Christ*; *Come Rack! Come Rope!*; *Confessions of a Convert*; *Initiation*; and *An Average Man*.

BEREA COLLEGE. An institution for higher education, founded at Berea, Ky., in 1845. In addition to the college department, there is a normal school, an academy, and several vocational schools. The students enrolled in all departments of the university in the autumn of 1914 was 1067. The faculty numbered 90. Dr. Charles F. Hubbard, dean of the college, resigned, and Prof. C. F. Rumold became acting dean. There were several instructors added to the vocational schools. There were no noteworthy benefactions received during the year, but the productive funds amount to \$1,050,000, and the annual income to \$120,000. The library contains about 30,000 volumes. The president is William G. Frost, Ph.D., D.D.

BERIBERI. Little had studied this disease in Newfoundland since 1907 and believed it to be on the increase. He stated that beriberi was uncommon among deep-sea fishermen when a proper diet was maintained. On American fishing vessels beriberi is rarely observed, even among the halibut fishers, who are sometimes away for long periods. On Newfoundland vessels symptoms of beriberi are common, and the severe types occur not infrequently. The food on these crafts is practically identical with that of people living on shore, and consists, with little variation, of tea and bread, salt meat, and occasionally duff with raisins. Potatoes and turnips are to be had at times. The common cause both among sailors and landmen is the lack of fresh food at certain times of the year, and a complete dependence on white flour. The Eskimo and the Indian avoid the disease by eating plenty of fresh meat. Among the last 5000 cases seen at the St. Anthony Hospital, beriberi occurred 220 times. Darling, who accompanied General Gorgas on his recent visit to South Africa and Rhodesia, regards beriberi and scurvy as nearly identical; numerous autopsies show

lesions in the heart, muscle, and nerves of the same type as that observed in beriberi. The disease occurs under similar circumstances. Scurvy breaks out among laborers, soldiers in barracks and camps, among the inmates of asylums and prisons, and in times of famine, and is always immediately dependent on the continued consumption of a one-sided diet and one free from vegetables. Certain epidemics display symptoms which are closely paralleled by those of beriberi. Gorgas pointed out that the diet of the negro laborers in the Rand consists too largely of carbohydrates, considering the amount and character of the work demanded of the negro laborers. Overmilled corn was the chief article of diet, overcooked corn as well as overboiled food of all kinds; roasted meat was never supplied, and the vegetables were insufficient in quantity and overcooked. That beriberi is not unknown in the United States is indicated by a report of Parker of the United States Public Health Service, concerning cases of "jail edema" among the prisoners confined in the county jail at Elizabeth, N. J. In three years, 22 cases of "jail edema" occurred among the inmates, and it is stated that at least 80 per cent of the prisoners serving more than ninety days contract the disease. These are really cases of beriberi. No data are given as to diet and sanitation at this particular institution. See **HYGIENE.** A complete résumé of the knowledge of this interesting disease up to the present time may be found in *Beriberi*, by Edward B. Vedder, Captain, Medical Corps, U. S. Army (New York, 1913).

BERMUDA. A group of over three hundred small islands, islets, and rocks, lying east of North Carolina, and 677 miles from New York; a British colony. The total area is 19 square miles, and the population in 1911 was 18,994, of whom 12,303 were colored, and 6691 white. Hamilton, the capital, had 2627 inhabitants; St. George's, 1079. About one-third of the area is under cultivation, the chief products being lily bulbs and vegetables for export to the New York market. Imports of food supplies come principally from the United States. The islands are a favorite winter resort. The total imports for 1912 were valued at £637,178 (£545,540 in 1911), and the exports at £116,586 (£134,033). Tonnage entered and cleared in 1912, 1,273,666 (700,869 in 1911). Public debt 1912, £45,500. Revenue, 1912, £83,629 (£79,248 in 1911); expenditure, £78,210 (£90,100). Customs revenue for 1912, £67,672; 1911, £63,707; 1910, £64,999. The colony is administered by a governor (Lieut.-Gen. Sir George M. Bullock in 1914), who is commander-in-chief of the military forces. There is an executive council; also a legislative council, and a representative house of assembly of 36 members.

BERNHARDI, FRIEDRICH VON. See **WAR OF THE NATIONS AND LITERATURE.**

BERTILLON, ALPHONSE. A French penologist, died Feb. 13, 1914. He was born in Paris in 1853. His father, Louis Adolph, was a famous French statistician who practiced medicine for a number of years and then devoted himself to the science of anthropology. Thus the son from his earliest boyhood heard the science of man discussed in his home. He studied medicine in connection with scientific work with his father, and was admitted to practice. In 1880 he perfected what he claimed to be an infallible identification system. At

first his theories were ridiculed, but he finally succeeded in convincing the authorities, and the system was introduced in Paris in 1883. It rapidly grew in popularity until it was adopted by police departments in all parts of the world. His system of measurements continued to be an important means of identification of criminals and others, until the introduction of the fingerprint system which finally came to supersede it. Bertillon has been given credit for inventing this system, but in reality the father of the development of the fingerprint identification was Francis Galton, the English anthropologist. Bertillon's system was based on his discoveries that certain physical features and the dimensions of certain bones or bony structures in the human body remain practically the same during adult life. He took, therefore, the measures of the head length, head breadth, the length of the middle finger, the left foot, and the length of the forearm from the elbow to the little finger. These measurements were subdivided into three classes, small, medium, and large. As the system developed M. Bertillon, to make the measurements more certain, added the height of the person, color of the eyes, and the length of the little finger. All this information is entered on classified cards any one of which is easily picked out when a particular identification is desired. By means of this system the police are able to keep record of criminals who have been arrested and convicted. M. Bertillon was also a handwriting expert, and in 1894 he was officially appointed to report on the handwriting of the bordereau in the famous Dreyfus case. He was a witness for the prosecution, testifying before the Cour de Cassation on Jan. 18, 1889. He was accused of making serious errors in his testimony, and the Municipal Council of Paris adopted a resolution calling upon the Prefect of Police to dismiss him as director of the Anthropometric Department because of these errors. He was removed on the following day, but later resumed his services in the department. Among his inventions to aid in identification work is a camera for metric photos by which the parts photographed may be measured. He wrote several volumes on the subject of his researches and studies in criminology.

BEST, DIONYSIUS F. A Roman Catholic priest, died April 26, 1914. He was born in Wales in 1862, and in 1879 entered the Order of Our Lady of Mount Carmel. He removed to the United States and was ordained to the priesthood at New Baltimore, Pa., in 1889. He was prior at Carmelite houses in Niagara Falls, New Baltimore, and Englewood, N. J. In 1909 he was appointed Provincial of the Carmelite Order of the United States and Canada. He made several official visits to the Vatican.

BIBLE SOCIETY, AMERICAN. An organization formed for the encouragement of a wider circulation of the Holy Scriptures, and for the distribution of copies of Bibles or portions of Bibles. The total issues for 1913-14 amounted to 5,251,176 volumes, an increase over 1912-13 of 1,201,566 volumes. The whole number of issues was made up of 412,229 Bibles, 763,158 New Testaments, and 4,075,789 portions of Scriptures. The principal advance was in the latter item, but more Bibles and more New Testaments were sent out in 1914 than ever be-

fore in the history of the society. Nearly one-half of these volumes, or 2,327,390, were sent out from the Bible House in New York, which is an increase of 219,531 volumes over the preceding year. The remaining volumes were sent out by the society's agents abroad. The domestic work of the society is carried on through home agencies, which include home agencies for the colored people, and agencies for each section of the country. The foreign agencies are situated in practically every country on the globe. During the 98 years of its existence, the society distributed 103,519,891 volumes. In May, 1916, 100 years' service of the American Bible Society will be completed, and a committee has been charged with the preparation of a general plan for some adequate celebration of this event. The officers are: President, James Wood; corresponding secretaries, Rev. John Fox, Rev. William I. Haven; recording secretary, Rev. Henry O'Dwight; treasurer, William Foulke.

BICKMORE, ALBERT SMITH. An American naturalist and educator, died Aug. 12, 1914. He was born at St. George, Me., in 1839, and graduated from Dartmouth College in 1860. From 1860 to 1864, with the exception of one year spent as a volunteer in the Civil War, he studied with Professor Louis Agassiz and in the latter year he received the degree of B.S. from Harvard University. He became Professor Agassiz's assistant and accompanied him to Bermuda, collecting for the Cambridge Museum. In the following three years he traveled in Europe, in the East Indian Archipelago, China, and Japan, returning by way of Siberia, Moscow, St. Petersburg, and London. In 1869 he became professor of natural history at Madison, now Colgate University. In the same year, however, he was appointed superintendent of the American Museum of Natural History and served in this post until 1884. From the latter date he was in charge of the department of public instruction at this museum, and retained this post until 1904, when he retired as professor emeritus. From 1895 to 1904 he averaged 12,000 miles of travel a year, gathering material for his lectures and for the enrichment of the museum. His lectures covered more than 200 subjects relating to geography and natural history. Several years before his death he suffered a stroke of paralysis and was forced to use a wheel chair. He continued, however, to visit the museum and attend lectures. He published accounts of travels in the East Indian Archipelago, and wrote much on geographical and other subjects. He was a member of many scientific societies.

BICYCLING. See CYCLING.

BILLIARDS AND POOL. William F. Hoppe, champion of the world at 18.2 and 18.1 balkline billiards, added more laurels to his crown in 1914 by winning the 14.1 balkline championship. That Hoppe is in a class by himself is further evinced by the record high runs and averages he scored during the year. In amateur circles Edwin W. Gardner, a former holder of the championship, recaptured his title by defeating Morris Brown, also a former champion, in the final game of the amateur tourney. The most striking figure in amateur circles, however, was Charles Heddon of Dowagiac, Mich., who set a new high run record of 135.

Alfred de Oro retained his three cushion title and thereby became the permanent possessor of

the Lambert trophy. De Oro won this honor by defeating George W. Moore. The men played three blocks of 50 points, De Oro scoring 150 as against his rival's 92. In this match the champion set a new world's mark by making a run of 13 points.

Benny Allen of Kansas City won the pocket billiard championship and permanent possession of the trophy. Allen had captured the title in 1913 through his defeat of De Oro, and he successfully defended his laurels in 1914 by vanquishing Charles Weston, Edward J. Ralph, Ray Pratt, and James Maturo. In one of these matches Allen made a new world's record by running 71.

Few international contests were held during the year. Opportunity was afforded, however, for Hoppe to meet Melbourne Inman, the English champion, in a series of matches at alternate blocks of American and English billiards. Hoppe was the victor. Sels, a Belgian, had the distinction of winning a world's championship tournament over several French competitors.

BIRKHIMER, WILLIAM EDWARD. An American soldier, jurist, and educator, died June 10, 1914. He was born in 1848 at Somerset, Ohio, and graduated from the United States Military Academy in 1870. He had previously served in the Civil War, enlisting as a private in 1864. He graduated from the Artillery School in 1873, was appointed first lieutenant in 1879, captain in 1898, and colonel in 1899. He was honorably mustered out of volunteer service in 1901, and in the same year appointed major in the artillery corps of the United States army. He became lieutenant-colonel in 1905, and brigadier-general in 1908. In the same year he was retired at his own request, after forty years of service. From 1874 to 1876 he was assistant professor of natural and experimental philosophy at the United States Military Academy. In 1899 he acted as associate judge of the Supreme Court in Manila. He was awarded a medal of honor for most distinguished gallantry during service in the Philippines in 1899. He was the author of: *Law of Appointment and Promotion in the Army of the United States* (1880); *Historical Sketch of the Organization, Administration, Material, and Tactics of the Artillery, United States Army* (1884); *Military Government and Martial Law* (2d ed., 1904).

BLIND, CARE OF THE. In Great Britain the problem of the care and education of the blind became the subject of parliamentary notice. A member stated that "the present system of voluntary effort in aid of the blind people of this country does not adequately meet their necessities and that the State should make provision by which capable blind people may be made industrially self-supporting and the incapable and infirm be maintained in a proper and humane manner." Material for the discussion of this subject was furnished by the appearance of the census in England and Wales made in 1911 which had just been issued. The number of totally blind was given at 26,336 of whom 13,257 were males and 13,079 were females: that is one person out of 1370 is blind. The figures were a

little below the last census, taken in 1901, when the proportion was one to 1385. In 1851 one person out of every 978 was returned blind. It was pointed out, however, that in view of worthlessness of returns in regard to the degree of blindness, it was decided that every defect of vision which forbade the ordinary means of livelihood should be regarded as equivalent to total blindness. In the whole United Kingdom it is estimated that there are between 32,000 and 34,000 blind persons, of whom 5000 are in workhouses, 5000 are receiving parish relief, 7000 are beggars, and about 3000 are employed in voluntary institutions, at wages averaging \$2.50 per week. Small pensions averaging \$50 a year are received by 5800 blind persons from charitable organizations.

BLINDNESS. See ALCOHOL, *Wood Alcohol*.

BLOOD WASHING. Iurevich and Rosenberg have demonstrated the interesting fact that the blood can be removed from the body of animals, thoroughly washed and reintroduced without causing any appreciable morbid symptoms. In their experiments blood was taken from the carotid artery of rabbits, and drawn into test tubes containing a 1.5 per cent solution of sodium citrate to prevent coagulation. As much as one-half of the total of the animal's blood was drawn, centrifuged for about 10 minutes; the plasma removed and replaced with normal salt solution; the blood again centrifuged, warmed, and reintroduced into the animal through a vein in the ear. It was found that only a small proportion of the red blood cells was destroyed by the process, the majority remaining normal even when the blood was kept outside of the body 2 or 3 hours. The practical application of this discovery will be found in cases of toxemia, when the blood is saturated with poisonous substances. In such cases the withdrawal, purification, and return of healthy blood may prove a life-saving measure.

BLUE MILK is a phenomenon observed as early as 1838 by Steinhof. The bacteriologist Hueppe was the first to obtain, in 1884, a blue milk organism in a pure culture. Other causes for this discoloration have been suggested, such as allowing the milk to stand in iron dishes, and the eating of certain plants by cows; but the phenomenon is in the great majority of cases caused by the growth of micro-organisms in the fluid. Hammer, of the Iowa Agricultural Experiment Station, received several samples of blue milk and succeeded in isolating from them the *Bacillus cyanogenes*, the same organisms that have been isolated from other specimens of blue milk. The new and important fact, however, brought out by his investigation was that the trouble occurred in only two closely associated households out of eighteen served from the same dairy, which would indicate that the milk was infected in the household, and not at the dairy. As far as is known, this organism is entirely harmless, and the milk is objectionable only on account of its color.

BLUE SKY LAWS. As the result of the flotation of numerous fraudulent companies, and the swindling of innocent investors out of millions of dollars by sharper investment companies, no fewer than twenty States have enacted what are known as "blue sky" laws, a name derived from a statement of a Kansas Bank Commissioner that certain companies were capitalizing the blue sky. The first, enacted by

Kansas in 1911, was due to the speculation in oil and gas companies. These laws aim to protect the investing public by requiring dealers in securities to secure a State license, and to file with some State authority information regarding stocks and bonds which they are handling.

Early in February the Federal District Court at Detroit declared the Michigan Blue Sky Law unconstitutional on the grounds of interference with interstate commerce and with the individual's right of free contract, and an unlawful extension of the police power of the State. The suit was prosecuted by the Investment Bankers' Association. Appeal was taken to the United States Supreme Court. In July the Iowa statute was declared unconstitutional on the ground of interference with interstate commerce and discrimination against the residents of other States.

In other decisions the West Virginia law also was declared unconstitutional, while those of Florida and Arkansas were upheld. The United States District Court declared the West Virginia law unconstitutional because in depriving individuals of the right to sell stocks, bonds, and securities it deprived them of property without due process of law. The decision held moreover that the law denied the plaintiffs the equal protection guaranteed by the Fourteenth Amendment; that it imposed burdens on interstate commerce; and that it vested powers in the State Auditor in violation of the West Virginia Constitution. There was, however, in this case a dissenting opinion which held the law constitutional since it was intended to apply only to corporations and not to individuals; since it did not restrict the borrowing or lending of money, but only regulated the business of corporations selling securities; and since it fulfilled important public services, and prevented frauds and impositions.

The Florida law was upheld by the State Supreme Court primarily owing to a section which excluded from the operation of the law any seller of securities who had become their bona fide owner prior to sale. The Arkansas law was upheld in the Federal District Court in a case brought by an investment company floating its own securities on quasi-deposit contracts. The court held that grounds for unconstitutionality such as were advanced in the West Virginia case did not apply because the complainant was not engaged in the sale of stocks, bonds, and other securities. The Iowa and Michigan laws were declared unconstitutional on grounds similar to those found in the West Virginia case.

BOILERS. One of the tendencies noted during the year was the firm establishment of the practice of forcing boilers to double or even triple their rating to carry the peak load, especially at large generating plants. Once it was customary to provide a boiler horsepower for every kilowatt of generating capacity, but now at the larger stations a ratio of 1 to 4 is common. In the large generating plant of the United Electric Light and Power Company at 201st Street, New York, officially put in commission on Jan. 31, 1914, one boiler horsepower was expected to care for 4.7 kilowatts, while at the Waterside Station, No. 2, the ratio of boiler horsepower to installed generating capacity was 1 to 4, and in emergencies at the Edison Company at Delray, Detroit, one boiler horsepower would supply 5.65. Such use depends largely

upon the quality of the feed water, and at some of these large stations the use of distilled water was being considered so as to prevent scale forming or the effects of suspended matter. Naturally forced draught must be used to a great extent in such installation. Among the notable boiler constructions of the year was a 1280-horsepower Keeler water tube boiler for the Nichols Copper Company, Long Island City, while there was being installed at the new Connors Creek station of the Detroit Edison Company a Stirling boiler rated at 2350 boiler horsepower. A new sectional water tube boiler was perfected during the year by A. Venning of Preston, Ontario, in which the novel feature was a large circulating pipe to convey all of the water from each drum to the bottom of the header sections, while T. T. Parker in New York adopted a cross section water tube boiler with several new features. During the first half of the year 1914 there were reported 340 boiler failures, in which 120 were given as killed, and 240 injured. In 80 cases the monetary loss was reported as \$246,000, making an average of about \$3000. The greatest loss, \$100,000, resulted from fire following a boiler explosion. In power-plant explosions, 60 were due to failures, and 30 to cast-iron headers in water tube boilers, and in 17 giving way of blow-off pipes. Cast-iron heating boilers were found to be a considerable menace, and should receive increased attention.

At the annual meeting of the American Society of Mechanical Engineers, held in New York City in December, a committee of the society presented a proposed code for the construction and installation of steam boilers, which had been drafted after an elaborate study of the subject, which had consumed some three years. This preliminary draft was submitted to the annual meeting for discussion, being the basis for a final report, which will contain a code to be recommended to the various State Legislatures for enactment into law, to govern the construction and installation of steam boilers, which would secure harmony and uniformity throughout the United States. State legislation on the subject of boilers was in force in Massachusetts, and it was the idea of the committee that the code framed, and further State legislation based on it, should be along similar lines. The report of the committee was criticised somewhat as providing too much detail, which with the development of modern scientific construction might become obsolete, but at the same time, inasmuch as numerous States were anxious and ready to pass legislation governing the construction of steam boilers, and to secure not only uniformity but the best and most reasonable practice, it aroused considerable interest. The problem was considered one of considerable complexity, as the Federal government has jurisdiction over the construction of steam boilers used in vessels, and over boilers of railway locomotives, while various standards have figured in the legislation of the different States, and differences in materials have proved embarrassing to various boiler-makers.

BOKHARA. A Russian vassal state in central Asia. Area, about 83,000 square miles, with a population estimated at 1,500,000. The capital is Bokhara, with about 75,000 inhabitants; Karshi has about 25,000; Khuzar, about 10,000. There is a large annual import of green tea,

mostly from India, and an export to India of raw silk. Other products are corn, tobacco, hemp, and livestock. An ameer is the native ruler—Sayid Mir Alim Khan in 1914.

BOLIVIA. A South American republic. The seat of government, executive and legislative, is La Paz; the Supreme Court site at Sucre.

AREA AND POPULATION. Varying estimates are given for the area of Bolivia. In 1911, the *Boletín de la Oficina Nacional de Estadística*, published at La Paz, stated the area at 1,379,014 square kilometers (532,437 square miles), and the estimated population (at the end of the fiscal year 1910) at 2,265,801. In 1912, the director-general of the *Oficina Nacional de Estadística* stated that the area of the republic, inclusive of disputed territory, was 1,458,034 square kilometers (562,047 square miles). An estimate of the population in 1912 was 2,450,000; the 1911 estimate was 2,267,935. The 1900 census returned 1,744,568 inhabitants, of whom 50.9 per cent were Indian, 26.7 mestizo, 12.7 white, 0.21 negro, and 9.4 unclassified. The larger towns include La Paz, with about 95,000 inhabitants (another estimate is 82,000); Cochabamba, 30,000; Sucre, Potosí, and Oruro, each about 25,000; Santa Cruz, 21,500; and Tarija, 8000.

PRODUCTION AND COMMERCE. Agriculture in Bolivia is of little commercial importance. The estimated area under cultivation is about 4,940,000 acres, producing corn, rice, barley, beans, potatoes, etc.; coffee, cacao, coca, and quina are also produced. Large quantities of rubber are gathered, especially in the north; rubber stands second in value among the country's products, tin being first. It is upon tin and other minerals, particularly silver, bismuth, copper, and gold, that Bolivia's prosperity largely depends. In output of tin ore, Bolivia ranks next after the Federated Malay States.

Imports and exports have been valued as follows, in thousands of bolivianos:

	1908	1909	1910	1911	1912	1913
Imports	33,069	36,937	48,802	58,371	49,509
Exports	58,924	63,764	74,567	82,681	90,123	93,722

The principal classified imports in 1911 were: Mineral products and manufactures, 19,992,494 bolivianos; vegetable products and manufactures, 12,497,512; animal products and manufactures, 9,081,844; textiles and manufactures, 7,219,180; machinery, hardware, etc., 2,554,661; beverages, 2,191,838; arms and explosives, 2,026,415. Classified exports in 1912 and 1913, respectively, are reported as follows: Raw or slightly wrought material, 83,537,025 and 90,000,808 bolivianos; gold and silver, including coin, 6,182,379 and 2,954,436; manufactures, 256,074 and 621,199; live animals, 121,771 and 117,310; food products and beverages, 25,738 and 27,760; total, 90,122,987 and 93,721,513. The table below shows in bolivianos the value of Bolivia's exports in 1910, 1911, and 1912:

	1910	1911	1912
Tin	37,006,504	52,639,603	60,238,197
Rubber	26,825,231	18,921,192	15,508,721
Silver	5,264,441	4,587,746	4,308,329
Copper	1,788,072	1,426,948	3,889,176
Bismuth	1,966,595	2,218,051	2,150,042
Gold coin	7,188	1,297,875
Coca	420,105	511,051	786,290
Wolfram	141,629	281,188	519,705
Silver coin	5,501	791,508	482,400

	1910	1911	1912
Zinc	435,009	872,490	829,995
Cattle hides	218,163	259,182	275,768
Lead	700	28,546	214,977
Gold	94,907	144,275

Total, including other	74,566,556	82,681,172	90,122,988
------------------------	------------	------------	------------

Imports and exports by countries, in thousands of bolivianos:

	Imports		Exports	
	1911	1912	1911	1912
Germany	10,811	16,514	10,998	11,201
United Kingdom	12,470	9,070	59,582	66,954
United States	9,865	4,595	627	892
Chile	9,837	3,982	411	850
Peru	2,759	8,781	22	954
Argentina	8,220	3,029	454	698
Belgium	4,064	2,571	3,760	3,589
France	2,882	2,486	6,751	5,472
Total including other	58,371	49,509	82,681	90,123

COMMUNICATIONS. According to the Bolivian *Boletín de la Dirección General de Estadística*, published in 1914, railways in operation in the latter part of 1913 aggregated 1292 kilometers (803 miles), distributed as follows: Antofagasta-Oruro (without branches), 922 kilometers, the length of the Bolivian section being 482 km.; the branch line Unyuni-Huanchaca, 38 km.; Viacha-Oruro, 202 km.; Guaqui-La Paz, 98 km.; the tramways Cochabamba-Vinto-Cliza, 57 km.; Río Mulatos-Potosí, 174 km.; Arica-Alto de La Paz, 439 km., the length of the Bolivian section being 233 km.; the branch from this last line to Corocoro, 8 km. Lines under construction, aggregating 605 km. (376 miles), were: Oruro-Cochabamba, 195 km.; Unyuni-Tupiza, 194 km.; Viacha-La Paz (via el Kenko), 29 km.; the tramway Cliza-Arani, 19 km.; Machacamarcá-Uncía, 83 km.; Guajaramerim-Riberalta, 85 km. The last-named line is in the extreme north, Guajaramerim being the Brazilian southern terminal of the Madeira-Mamoré Railway. Lines for which surveys had been made were: La Quiaca-Tupiza (93 km.); and Puerto Suárez-Santa Cruz (683 km.). La Quiaca is an Argentine town on the frontier; Puerto Suárez is a Bolivian town on the eastern frontier. In addition, the length of projected lines and partially surveyed lines was estimated at 2573 km.

The principal line is the one extending from Antofagasta, on the Chilean coast, to the frontier town Ollagüe (440 km.), and thence through Uyuni, Río Mulatos, Challapata, Poopó, and Machacamarcá to Oruro (482 km.). At Oruro, connection is made for Viacha (202 km.); Viacha is also on the Guaqui-La Paz line, and the line from Arica; the distance from Viacha to Alto de La Paz is 23 km., and thence by electric, to La Paz, 8 km. The distance from Viacha to Guaqui, on Lake Titicaca, is 65 km. Steamers connect with Puno, on the Peruvian shore of the lake, whence there is rail communication by way of Juliaca and Arequipa with the Peruvian port Mollendo. The distance from La Paz to Antofagasta is 1155 km., from La Paz to Mollendo 861 km., and from La Paz to Arica 447 km. These lines reach very great altitudes; the elevation of Alto de La Paz is stated at 4089 meters, of Viacha 3919, of Charaña 4059, of Oruro 3703, of Río Mulatos 3806.

The estimated length of navigable rivers in

Bolivia is 18,220 kilometers. Telegraphs in 1912: lines, 6133 km.; wire, 8951; offices, 194. Post offices, about 200.

FINANCE. The monetary unit is the bolivi-
ano, par value 38.932 cents; that is 12.5 bolivi-
anos are equivalent to one pound sterling. For
the fiscal year 1914, the estimated revenue and
expenditure were 25,263,500 and 25,258,450 bo-
livianos, respectively. The estimated revenue
for the fiscal year 1913 was 22,073,500 bolivi-
anos, including import duties 10,387,000, export
duties 4,971,500, and imposts 2,444,500. The
larger departmental expenditures for 1914 were
estimated as follows: Commerce and finance,
8,496,435; war and colonization, 5,070,629; in-
terior and fomento, 4,055,045; public instruction
and agriculture, 2,650,979. Public debt (1913):
Foreign, £473,600 (loan of 1908), £1,491,750
(1910), £1,000,000 (1913); internal, 5,467,610
bolivianos; floating, 5,542,283 bolivianos.

ARMY. A permanent force of 3153 officers
and men is maintained under the provisions of
the law of Feb. 5, 1910, and military service
from the 20th to the 50th year is compulsory.
The army is organized on a militia basis, where
five years is spent in the national army, with
about one year in the ranks, after which five
years is spent in the ordinary reserve, ten years
in the extraordinary reserve, and finally ten
years in the National Guard. The active army
is formed in six infantry battalions, one cavalry
regiment, one battery of field artillery, and one
of mountain artillery. In addition there are
small bodies of infantry at the chief towns of
departments which can be expanded from com-
panies or *columnas* into battalions, and two
squadrons of cavalry serving in Gran Chaco.
The infantry is armed with the 1898 Mauser
rifle, and the artillery has modern field and
mountain batteries from European ordnance
works.

GOVERNMENT. The executive power is vested
in a president who, with two vice-presidents, is
elected by direct vote for four years, and is in-
eligible for the next term. The president is as-
sisted by a cabinet of six ministers. The legis-
lative power rests with a congress of two houses,
the Senate and the Chamber of Deputies. Sena-
tors (16 in number) and deputies (75) are elected
by direct vote, the former for six years and
the latter for four. The president for the term
beginning Aug. 14, 1909, was Eliodoro Villazón.
His successor was Ismael Montes, inaugurated
Aug. 14, 1913. First vice-president, Juan M.
Saracho; second vice-president, José Carrasco.

On Feb. 21, 1914, the mining town of Chal-
lapata was completely destroyed, and many per-
sons were killed by the explosion of 3500 cases
of dynamite. See *INTERNATIONAL ARBITRATION
AND PEACE, Bryan-Wilson Treaties*.

BOOTS AND SHOES. The boot and shoe in-
dustry during the year 1914 was complicated
like other American manufacturing industries
by the great European war. Foreign nations
were in the American market for army footwear,
and where they were not, their own factories
were at work on such products, with the result
that the usual output was curtailed, and it was
believed that recourse must be had to American
goods. This was especially true in Great
Britain, where the British shoe industry was
practically commandeered to make army shoes,
and it was estimated that 50 per cent of the
factories were so engaged. Shoe leathers were

imported largely from the United States, and
American upper stock in particular was used.
German box calf leather, which had been rather
favored by the Admiralty supply department,
was excluded from the specifications for heavy
shoes. England was also a purchaser in the
American markets, but not to the extent that
the French and other continental governments
were, the French government in December plac-
ing an order for 500,000 pairs of army shoes
with a large New England manufacturer. All
Europe apparently was in quest of American
boots and shoes, but the method of doing busi-
ness in many cases proved unsatisfactory to
American manufacturers and dealers, not only in
boots and shoes, but in leather and other sup-
plies. There was considerable discussion of the
accusation of graft on the part of purchasing
agents and inspectors, and the usual evils inci-
dent to the purchase of vast quantities, where
speedy deliveries rather than quality and price
were conspicuous, naturally were in evidence.
It was said that a pair of shoes lasts a soldier
engaged in actual warfare but one month, so
that shoes and shoe leather were naturally an
important military supply, which had to be con-
sidered.

In the American industry the manufacture of
shoes, especially for women, was running more
and more to styles, so that the retail trade so
far as women were concerned was becoming
more and more a "millinery" business in which
style and ornament had to be considered. Where
in previous years shoes for dancing had figured
prominently in the retail business, now orna-
mental styles, especially with cloth tops, fancy
buttons or with fancy buckles, were more largely
manufactured, and naturally introduced into the
business the various hazards where style or
styles must be considered. This increased use
of cloth tops had its economic effect in the
existing shortage of leather as well as in-
creasing a demand for certain cloths for this
purpose.

BOSNIA AND THE HERZEGOVINA.

Provinces, formerly Ottoman, annexed to the
Austro-Hungarian monarchy Oct. 5, 1908. The
provinces are administered by the Austro-Hun-
garian ministry of finance; seat of local govern-
ment, Sarajevo, in Bosnia. The area of Bosnia
is 16,239.4 square miles, and of the Herzegovina
3528.5 square miles; total, 19,767.9 square
miles. Population according to the census of
Oct. 10, 1910: Bosnia, 1,631,006; the Herze-
govina, 267,038; total civil population, 1,898,-
044; in addition, the military population num-
bered 33,758, making the total number of inhabi-
tants 1,931,802, as compared with 1,591,036 in
1905. Estimated population at the end of 1912,
1,962,411, of whom 626,649 were Mohammedan,
856,158 Serbian Orthodox, 451,686 Roman Cath-
olic, 8605 Greek Catholic, 6734 Protestant, and
12,798 Jewish. The larger towns are Sarajevo,
with 51,919 inhabitants in 1910; Mostar, 16,392;
Banjaluka, 14,800; Tuzla, 11,333; Bjelina, 10,-
061; Srebrenica, 7215; Brčka, 6647; Travnik,
10,061.

Elementary schools in 1910 numbered 458,
with 41,130 pupils; in addition, 1970 Mohamme-
dan mektebs, with 64,805 pupils, and 94 re-
formed mektebs, 7719 pupils. In 1912 the ele-
mentary schools had increased to 544. There
were in 1912, 6 gymnasia, 2 realschulen, 3 train-
ing colleges for teachers, 11 advanced schools

for girls, and various technical and professional institutions.

The soil is fertile, but agriculture is not highly developed. Minerals are abundant, including lignite, iron, copper, manganese, and chrome ore. Railway open in 1912, 1215 miles; telegraph lines, 1972 miles, with 4193 miles of wire; post offices, 222.

BOSTON FIRE PROTECTION. See FIRE PROTECTION.

BOSTON UNIVERSITY. An institution of higher education, founded under the auspices of the Protestant Episcopal Church in Boston, in 1869. The total enrollment in the several departments in the autumn of 1914 was 2004, with a faculty numbering 170. The changes in the faculty included the appointment of Arthur H. Wilds, Ph.D., professor of education, and Charles P. Huse, assistant professor of social science. There were no noteworthy benefactions received during the year. The productive funds of the university amount to about \$2,478,047, and the annual income to about \$220,000. The library contains about 86,000 volumes, but the university adjoins the Boston Public Library, and has the benefit of its collections. The president is Lemuel H. Murlin, D.D.

BOTANY. The American Association for the Advancement of Science with the affiliated Botanical Society of America, the American Phytopathological Society, and others, met in Philadelphia, Pa., Dec. 29, 1914, to Jan. 2, 1915. The Society of American Bacteriologists met at Toronto, Canada, Dec. 31, 1913, to Jan. 2, 1914. The meeting of the British Association for the Advancement of Science was held in Australia in August, 1914, and the French Association at Havre, July, 1914. The annual meeting of the German Society for Plant Breeding was held late in 1913. An International conference on phytopathology was held in Rome, Feb. 24 to March 4, 1914.

Among the botanists of note to die during 1914 were Dr. W. W. Bailey, emeritus professor at Brown University, R. I.; M. C. Cooke, the British mycologist; P. van Tieghem, botanist and permanent secretary of the Academy of Sciences, Paris; Dr. J. Reynolds Green, University of Liverpool; Dr. S. M. Jorgensen, director Carlsbad Laboratory, Copenhagen; and Dr. B. Lidforss, University of Lund. Dr. Jacob Eriksson retired from the directorship of the phytopathological station at Stockholm, Sweden. Dr. F. L. Stevens was appointed professor of plant pathology at the University of Illinois. Dr. T. H. McBride, long professor of botany at the University of Iowa, was promoted to the presidency of that institution. A new journal, the *American Journal of Botany*, was launched during the year. It is published jointly by the Brooklyn Botanical Garden and the Botanical Society of America. *Revue Phytopathologie Appliquée*, a journal devoted to plant diseases, also began publication.

Among the legislative acts of botanical importance was the adoption of a convention by the Phytopathological Conference at Rome regarding the control of plant diseases and insect pests. This convention has been referred to the various supporting governments for ratification. Thirty-seven countries have organized for the control of plant diseases and other pests. Japan recently adopted a strict quarantine of nursery plants, fruits, etc. The Federal Horticultural

Board continued to enforce the Federal Plant Quarantine act, which was amended in some minor respects during the year. On account of the presence of powdery scab of potatoes (*Spongospora subterranea*) a quarantine against part of Maine was declared. The disease was also reported in New York late in the season. The presence of a serious disease of citrus trees, citrus scab, was reported throughout the Gulf States, and a quarantine against the importation of all forms of citrus nursery stock was promulgated Dec. 10, 1914. A deficiency appropriation of \$35,000 was made by Congress to combat this disease. Congress made an appropriation of \$70,000 to study the chestnut tree blight, but the active campaign in Pennsylvania and elsewhere for its control has been abandoned.

PLANT BREEDING. Bateson, in the presidential address before the British Association for the Advancement of Science, reviewed the evolutionary aspects of genetic research and claimed that variation in a series is due to loss of factors and not the acquisition of new ones. DeVries has added to his contributions on mutations and reports many forms of wild and cultivated plants due to mutation. Waterman claims mutations observed by him in molds were limited by substances in the culture media. Atkinson produced *Oenothera* hybrids that were constant from the first generation. A mutation of Cuban tobacco was described by Hayes and Beinhart. Hayes has reported that the inheritance of size, shape, and number of leaves in tobacco is determined by a number of factors of fluctuating variability. Emerson has offered an explanation of the inheritance of variation in variegated maize. Van Fleet has shown that second generation crosses of Asiatic and American chestnuts are practically resistant to the chestnut bark fungus. Jeffrey found that spontaneous hybridization is of very common occurrence among angiosperms. Nilsson-Ehle, from a study of variation in chlorophyll content of cereals, found it to be recessive to normal green color, confirming Emerson's claim regarding variation in leaf color of maize. He also claims that yellow is correlated with awnless oats, and white and black with the presence of awns. Daniel has given another report on his studies on xenia in beans. Harris found that weight of beans was correlated with the time required for their germination. McCall and Wheeler have shown that ear characters in maize are not correlated with yield. Jenesco reports having succeeded in obtaining only 35 rye-wheat hybrids out of over 6000 cross pollinations.

PLANT PHYSIOLOGY. Bose claims that nervous impulse in plants is fundamentally identical with that in animals. Lubimenko and Monteverde have announced the belief that chlorophyll production involves the conversion of leucophyll into chlorophyllogen and this acted upon by light yields chlorophyll. Iwanowski claims the remarkable stability of chlorophyll can be explained only by reason of its colloidal nature. Warner disputes the photosynthesis of carbon dioxide outside the plant, and Wager found the aldehyde formed by chlorophyll under the influence of light to be a decomposition product and not a direct result of photosynthesis. Baudisch claims nitrogen assimilation in plants is a photochemical process, inorganic nitrogen in the presence of formaldehyde being converted into complex nitrogen compound under the action of

light. Darwin has shown that transpiration does not cease in a saturated atmosphere. Light is held to influence transpiration through its warming effect on the chloroplasts or through rendering the plasma membrane more permeable. Janse claims the protoplasmic contents of the cell function in promoting the transpiration current. Hasselbring in studies of tobacco found that the amount of salts absorbed is independent of the rate of transpiration. Dachnowski claims that the amount of transpiration cannot be considered an index of the metabolism of plants. Duggar and Cooley found the effect of a film of Bordeaux mixture on plants was to increase transpiration. Briggs and Shantz have continued their studies on the water requirements of plants. Atwood studied the after-ripening of oats and found the process involved an increased permeability of the seed coats to oxygen and a rise in the acid content of the embryo. Shull claims that oxygen supply is the limiting factor in the germination of *Xanthium* seeds. Mlle. Promsy found the germination of seeds in fleshy fruits was hastened by a weak acidity such as brought about by the decay of the fruits. Appleman reports the rest period of potato tubers could be modified by various agencies. Baar found that certain species of seed germinating best in light while fresh were materially hastened by germination in darkness when old. Crocker and Davis have shown that seeds of various aquatic plants retain their vitality for years in an imbibed condition.

The stimulating effect of low or moderate radio-action substances on plants has been shown by Stoklassa, Malpeaux, and others. It also appears to favor nitrification of soils and hence increased fertility. Knight and Priestley believe the increased growth of plants under electrical stimulation is due probably to a rise in temperature and not increased respiration. Schikorra was unable to find the stimulating effect of high tension brush discharges on plant growth claimed by Vozory. The relation of various elements and compounds to plants has been investigated and continues to be a subject of investigation. Osterhout has given additional evidence relative to antagonisms of certain salts in plant cultures. Hubbard found chloral hydrate antagonistic to copper sulphate, Caldwell described the antagonistic effect of solutions of six paired salts, and Miyake found many salts that were injurious to plant life when used singly lost their toxic effect when employed in combination. Faack claims that calcium has a protective effect on plant tissues and that it also influences the distribution and localization of carbohydrates in plant organs. Haselhoff reports that he was unable to find any indication of a definite ratio of calcium to magnesium, as claimed by Loew. True called attention to the harmful effect of distilled water to plants, the injury being caused by the extraction of electrolytes and other substances from the cells. Dixon claims the dying of leaves beyond a steamed portion of a branch is due to the formation of poisonous substances in the sap. The wilting of the leaves is due to the plugging of the water channels. According to Fisher, a marked increase of carbon dioxide in the air causes a greater body growth, earlier and more abundant flowering and fruit production in naturally sterile hybrids. The presence and function of oxidases in plants has been treated of in contributions by Armstrong, At-

kins, Bunzel, and others. McCool found the stimulating effect of ether on bulbs and tubers was due to the activation of the diastase they contain. Jorissen demonstrated that hydrocyanic acid may be derived from citric acid acted upon by sunlight in the presence of traces of iron salts, and suggests that possibly the formation in plants takes place in a somewhat similar manner. Raybaud found that while hydrocyanic acid occurs in considerable quantity in young sorghum and millet plants in India it migrates toward the upper part of the plant and finally disappears as the grain reaches maturity. Combes claims to have experimentally produced in leaves a substance identical with anthocyanin and that the process is one of reduction and not oxidation.

MISCELLANEOUS. Maximow states that the injurious effect of freezing on plants is due to physical and chemical changes in the plasma colloids. Shreve claims the distribution of certain succulent plants is limited by the number of hours they are able to withstand temperatures below freezing and not the minimum temperature during that time. Kearney and others have reported upon the indicator value of plants in determining the possible agricultural value of soils. Tanret has claimed there is a plurality of starches, as many respond very differently to various agents, and Reichert, from a stereochemical study of the starches of a large number of plants, arrived at the conclusion that starches could be used as a basis for plant classification. Koketsu claims that laticiferous tissue in plants has an ecological rather than a physiological significance. Sartory and others have followed up the work of Bernard on the effect of fungi on tuberization and have found that they do exert an important rôle in the formation of potato tubers. McDougal has added to our knowledge of mycorrhiza on forest tree roots and has reported four additional species which form mycorrhiza on roots. Schramm claims, as a result of his experiments, that in general algae are without the ability to fix free atmospheric nitrogen in the complete absence of combined nitrogen. Mameli and Pollacci reject the theory of Jamieson regarding nitrogen assimilation through special trichomes on plants, but they find the function common to many plants, the assimilation of the nitrogen being connected with chemical changes that take place within the cell. Lyon and Bizzell claim certain plants are mutually benefited by having other species grown with them, but Westgate and Oakley found no appreciable gain in the protein content of plants grown in immediate association with leguminous plants.

PLANT DISEASES. There has been great activity among botanists during the year in studying parasitic fungi and plant diseases. On account of the extensive use of tar and similar products in road construction, investigations have been made of its possible injurious effect on plants, and Clausen found the injury was proportional to volatility and temperature. Gatin claims that strong sunlight increases the amount of damage done. The effect of smoke, dust, and gases from industrial works is being investigated, and in this country Anderson found dust from cement works prevented the setting of fruit to a distance of two miles or more. Hedgcock found the injury from smelter smoke in Tennessee to be extending over a considerable area.

Lipman claims poor nitrification in soils is a cause of die-back in citrus trees in California. Bunzel found curly dwarf in potatoes associated with increased oxidase activity. The relation of rust fungi to their host plants is receiving much attention and life histories and biological forms have been described by Arthur, Kern, Tranzschel, Fraser, and others. Studies of *Fusarium* have been published by Wollenweber in which a classification of many of the species is given. A considerable number of cereal diseases that have been considered of minor importance in Europe have recently become destructive, judged by the attention given them in literature. Among them are the leaf stripe, stem or foot rot, snow disease, etc. Bolley, Milbrath, and others have added to their previous publications relative to soil-borne diseases of cereals. Beauverie reports finding rusts of grains and wild grasses carried by the seed. The stinking smut of wheat was unusually prevalent in Washington and Idaho, and evidence has been obtained showing the fungus may pass the winter in the soil to some extent. The timothy rust is said to have become destructive especially in North Dakota and Wisconsin.

The chestnut bark fungus, *Endothia parasitica*, is continuing to be studied, but the campaign for its control has been almost abandoned. The presence of the disease in British Columbia was announced. Late in 1913 several cases of poisoning in Connecticut were referred to eating diseased chestnuts, but Clinton seems to have shown the presence of the fungus in no way contributed to the illness. Forest tree disease studies have been contributed by Long, Hedgecock, Weir, Spaulding, and others. The white pine blister rust has been reported in some new localities and Spaulding found *Pinus excelsa* to be a host of the fungus. The oak mildew in Europe has been recently found upon the American red oak, a species hitherto thought immune. Among fruit tree diseases peach leaf curl and pear blight have both been especially severe during the year. The blight was unusually prevalent on apple trees in the Northwestern States. From a note by Passy it appears that pear blight has made its appearance in France. One of the most serious of the new diseases during 1914 was the citrus scab, a disease thought to be of Japanese origin that has made its appearance in all of the Gulf States. While all kinds of citrus trees are subject to attack, grapefruit trees appear to suffer most injury. Cobb has described a nematode disease that appears to be present in all important citrus-producing countries. A new disease of strawberries was reported by Stevens. On account of the seriousness of potato diseases in Europe and the quarantine against the importation of potatoes into this country, studies have been made of the diseases of that crop in this country, and the powdery scab has been found in Maine and two or more localities in New York. A new storage rot due to a species of *Phoma* was found by Melhus in Maine. Wilt diseases, caused by species of *Fusarium* and *Verticillium*, have been reported in various parts of the United States. Wollenweber, Taubenhaus, and others have been studying the diseases of sweet potatoes and have found many new organisms associated with the diseases. Brooks claims the blossom end rot of tomatoes is caused by overmaturing or heavy fertilizing. A new disease of hemp was de-

scribed by Charles and Jenkins. O'Gara reports alfalfa blight and canker in Utah. Johnson described two diseases of tobacco in Wisconsin and he considers diseases and not soil depletion the cause of tobacco failures in Wisconsin and Canada.

In the control of plant diseases most of the experiments have been on the modification or extension of treatments already known. The use of dilute sulphuric acid for sterilizing seed beds has been reported by Hartley, Merrill, and others. The modified hot water treatment of grain for smut prevention continues to give excellent results and it has also been found to reduce the stripe disease of barley. Butler has published the results of a physico-chemical study of Bordeaux mixture and he has given some practical suggestions for making and storing that important fungicide. The formaldehyde gas treatment for the control of potato scab has been found injurious if used in too great an amount in proportion to the quantity of tubers treated. A large number of successful spraying experiments have been reported, indicating still more strongly the economic value of such treatments.

Bibliography. Among books on botany to appear were the following: Bergen and Caldwell, *Introduction to Botany* (New York, 1914); E. Bourcart, *Insecticides, Fungicides, and Weed Killers*, trans. by D. Grant (London, 1913); F. E. and E. S. Clements, *Rocky Mountain Flowers* (White Plains, N. Y., 1914); M. T. Cook, *The Diseases of Tropical Plants* (London, 1913); J. B. Davy, *Maize, Its History, Cultivation, Handling and Uses* (London, 1914); W. B. Grove, *The British Rust Fungi* (Cambridge, 1913); G. Haberlandt, *Physiological Plant Anatomy*, trans. by M. Drummond (London, 1914); K. Heyne, *De Nuttige Planten van Nederlandsch-Indie* (Batavia, 1913); M. Hollrung, *Die Mittel zur Bekämpfung der Pflanzenkrankheiten* (Berlin, 1914); L. Jost, *Vorlesungen über Pflanzenphysiologie* (Jena, 1913); F. Löhnis, *Vorlesungen über Landwirtschaftliche Bakteriologie* (Berlin, 1913); L. Mangin, *Parasites Vegetaux des Plantes Cultivées* (Paris, 1914); G. and I. Massee, *Mildews, Rusts, and Smuts* (London, 1913); Neuveu-Lemaire, *Parasitologie des Plantes Agricoles* (Paris, 1913); Piper and Beattie, *Flora of Washington and Adjacent Idaho* (Lancaster, Pa., 1914); E. F. Smith, *Bacteria in Relation to Plant Diseases*, vol. iii (Washington, 1914); G. Truffaut, *Les Ennemies des Plantes Cultivées* (Paris, 1913).

BOWDOIN COLLEGE. An institution for higher education at Brunswick, Me., founded in 1794. The student enrollment in the autumn of 1914 numbered 394, and the faculty numbered 29. There were no notable changes in the faculty during the year. There was received from the Drummond bequest the sum of \$80,000. The productive funds at the end of the year amounted to \$2,312,552, and the income to \$138,501. The library contained about 110,000 volumes. The president is William De Witt Hyde, S.T.D.

BOWLING. The bowling season of 1914 was made notable by the success that attended the Eastern devotees of the game. The East captured two of the American Bowling Congress titles at Buffalo and only one Westerner, William Miller of Detroit, made a creditable show-

ing. He won both the individual and all-around titles. The best two-men team of the year comprised D. H. Van Ness and John Negley of the Roseville A.A. of Newark who compiled a total score of 1245. The Monko team of New Haven with a total of 2944 led the way for the five men honors. The Genesee Five of Rochester established a world's record in bowling 3,025, exceeding the former mark of the Flor de Knispels of St. Paul by 29 pins.

Jimmy Smith of Brooklyn made the best individual showing throughout the year and for the second time in succession won the National all-around championship. The National Bowling Association at its convention held in Atlantic City passed upon the "loaded" ball question. After a long discussion the association adopted regulations whereby a ball may be made of anything so long as it is not balanced "off the centre" more than three ounces, the allowance for the boring of the finger holes.

The winners of the principal tournaments of the year were as follows: National Bowling Association—All-around, James Smith, Brooklyn, 1917; individual, Harry Krauss, Washington, 678; two-men, Glenn Riddell and Harold Horton, New York, 1333; five-men, Genesee, Rochester, 3035.

American Bowling Congress—All-around, William Miller, Detroit, 1897; individual, William Miller, 675; two-men, D. H. Van Ness and John Negley, Newark, N. J., 1245; five-men, Monko, New Haven, 2944.

BOWMAN, THOMAS. An American bishop of the Methodist Episcopal Church, died March 3, 1914. He was born in Berwick, Pa., in 1817, and graduated from Dickinson College in 1837. He read law for one year and in 1839 entered the Methodist Episcopal ministry. From 1840 to 1843 he was a tutor at the Dickinson Grammar School. In 1848 he organized, and from that year until 1858 was president of, Dickinson Seminary, Williamsport, Pa. From 1858 he was president and professor of mental and moral philosophy at Asbury (now DePauw University). From 1867 to 1872 he was Hannon Professor of Biblical Literature at this university, from 1884 to 1889 chancellor, and from 1899 until his death chancellor emeritus, of this university. In 1864 he was chosen chaplain of the United States Senate and held this post for two years. During this time he became the warm friend of Abraham Lincoln. In 1862 he was elected bishop of the Methodist Episcopal Church and eventually became senior bishop of that denomination. He retired from active service in 1896. As bishop he attended conferences in Europe, India, China, Japan, and Mexico and dedicated more than a thousand churches in various parts of the world. As a preacher he was especially noted for his appeals to young men.

BOXING. There were three upsets in the boxing world in 1914. Willie Ritchie, holder of the lightweight title, went down to defeat at the hands of Freddie Welsh, the English boxer; Johnny Coulon of Chicago, who for years had reigned supreme among the bantamweights, bowed to "Kid" Williams of Baltimore, and Al McCoy of Brooklyn gained the middleweight title by his defeat of George Chip. In heavyweight circles Jack Johnson successfully defended his title against Frank Moran, whom he defeated in a twenty-round bout in Paris. Johnson has since been matched to fight Jess Willard.

Boxing enthusiasts received a shock during the year as a result of the repeal of the law permitting bouts in California. The Pacific Coast State had been regarded as the strongest citadel of the sport.

The championships of the A. A. U. were held at Boston, April 17-18. The results of the final bouts were: 108-pound class, J. Downs of the Cleveland A. C. defeated L. Evin of the Union Settlement A. C., New York; 115-pound class, S. Phillips of the Boston Y. M. C. U. defeated N. McLatchey of Cambridge, Mass.; 125-pound class, V. Pokorni of the Cleveland A. C. defeated J. J. Sullivan of the Atlantic A. A. of Boston; 135-pound class, D. Stosh of the Cleveland A. C. defeated W. Buckley of Chelsea, Mass.; 145-pound class, M. Woldman of the Cleveland A. C. defeated P. McCarthy of Roxbury, Mass.; 158-pound class, W. Barrett of the Pastime A. C., New York, defeated C. J. Seegest of the Cleveland A. C.; 175-pound class, W. Hanna of the Riverside A. C., Toronto, defeated A. Sheridan of the Trinity Club, Brooklyn; heavyweight class, P. L. Kelly of Roxbury, Mass., defeated A. Sheridan of the Trinity Club, Brooklyn.

BOYCOTT. DANBURY HATTERS CASE. This famous case came for the second time before the Supreme Court in the early part of the year. This case grew out of a strike in July, 1902, by the Union Hatters of North America against Loewe and Company of Danbury, Conn., the purpose of which was to maintain a closed shop. In the following year a suit was brought against Lawler and 239 associated members of the union for maintaining a boycott in violation of the Sherman Anti-Trust Law. The American Federation of Labor undertook the defense for the union, while the Anti-Boycott Society of America supported the prosecution. In 1908 the Supreme Court declared the boycott illegal and the company was ordered to sue for damages. A verdict of \$74,000 was rendered by the United States District Court at Hartford late in 1909. This amount was tripled under the provisions of the Sherman Anti-Trust Law and the fine was to be levied upon the individual members of the union. Later the United States Circuit Court of Appeals set this verdict aside. It was then retried in the Hartford District Court where a decision for the plaintiff was rendered and \$80,000 and costs were awarded. Towards the close of 1913 a judgment of this court was affirmed and total damages of \$272,000 were awarded. The hearing by the Supreme Court was set for December 17 of last year, and the final decision was expected early in 1915.

OKLAHOMA DECISION. An interesting decision was that handed down in the spring of 1914 by the Oklahoma Supreme Court Division No. 2, which upheld the right of the union to strike for a close shop and declared the compound labor boycott, or secondary boycott, which is usually considered illegal, to be legal.

BOY SCOUTS OF AMERICA. An organization founded in 1908 for the purpose of training boys between the ages of 12 and 18 in self-reliance, manhood, and good citizenship. Its growth has been remarkable and a substantial increase was made in membership during 1914. At the end of that year it was organized in practically every community of 4000 inhabitants in the United States. There are now over 8000 scout masters, nearly 3000 assistant scout masters, about 500 scout commissioners, and over 700

local councils. The organ of the society is *Boys' Life*. The officers are: Honorary president, Hon. Woodrow Wilson; honorary vice-presidents, Hon. William H. Taft, Hon. Theodore Roosevelt; president, Colin H. Livingstone; chief scout, Ernest T. Seton; national scout commissioner, Daniel Carter Beard.

BRACKENBURY, SIR HENRY. An English soldier, died April 20, 1914. He was born in 1837 at Bolingbroke, Lincolnshire, and was educated at Eton and at the Royal Military Academy at Woolwich. He entered the Royal Artillery in 1856 and took part in the Central Indian campaign of 1857-58. Several years later he was selected to accompany the Society for Aid to Sick and Wounded with the Prussian Army in the War of 1870-71. His services were recognized by both the German and French Armies, and he returned to England with a reputation for efficiency. In 1873 he accompanied Sir Garnet Wolseley to the Gold Coast as assistant private secretary. He served with the latter in 1875 in South Africa, and later in the Zulu war and in the campaign against Sekekuni. In 1879 he was appointed Chief of Staff in South Africa and in this capacity served for one year, when he went to India as private secretary to the Viceroy. In 1881 he was appointed Military Attaché to the British Embassy in Paris, but after serving about a year he again joined Lord Wolseley in the Nile campaign of 1884-85. He accompanied General Earle as chief of staff of the river column, and after the latter's death at Kibekani, the command of the column devolved upon him. For his services in this campaign he was promoted to the rank of major-general. From 1888-91 he was Director of Military Intelligence at the war office, and from 1891-96 was Military Member of the Council of the Viceroy in India. He continued in this office until he became President of the Ordnance Committee, and afterwards Director-General of Ordnance. He held the latter appointment until his retirement in 1904. He was the author of several works dealing with military subjects.

BRADBURY, WILLIAM FROTHINGHAM. An American educator and mathematician, died Oct. 22, 1914. He was born at Westminster, Mass., in 1829, and graduated from Amherst College in 1856. He became a teacher in Cambridge High School in 1856, and from 1881 to 1886 was head master of this school. In the latter year he was appointed head master of Cambridge Latin School, serving until 1910, when he was appointed head master emeritus. He published many text books dealing with mathematics and also patented a device for teaching the metric system, and a noiseless school desk.

BRADFORD, ROYAL BIRD. A rear admiral (retired) of the United States Navy, died Aug. 6, 1914. He was born in Turner, Me., in 1844, and graduated from the United States Naval Academy in 1865. In the following year he was appointed ensign. From this time until 1885 he saw much sea service. In the latter year he began organizing a naval electrical department and superintended the installation of an electric lighting plant on the United States steamship *Trenton*, the first war vessel of any nation to use electricity. He commanded the *Bennington* on the coast of Chile, when war with that nation threatened, participated in the Columbus celebration in Italy in 1892, and in 1896

became a member of the board of inspection and survey. At the outbreak of hostilities between the United States and Spain he offered his resignation as chief of the bureau of equipment and asked for active service. He was left at the head of the bureau and President McKinley complimented him on the efficiency he displayed in supplying the fleet with coal in remote parts of the world. Admiral Bradford served later on many technical boards and also as a member of the general board of the navy on war plans. He received the rank of rear admiral in 1904 and was retired for age two years later.

BRADLEY, WILLIAM O'CONNELL. A United States Senator from Kentucky, died May 23, 1914. He was born in Lancaster, Ky., in 1847, and was educated in the public schools. At the age of 14, when the Civil War broke out, he ran away from home and joined the Union Army, but on account of his youth his service was refused. In 1861 he acted as page in the lower house of the Kentucky legislature. At the age of 18 he was licensed to practice law in the State and Federal courts of Kentucky, and in the United States courts. In 1870 he was elected county attorney of Garrard County, and in 1872 and again in 1876 was Republican candidate for Congress, but was defeated. He was elected delegate at large to seven Republican national conventions, and in 1880 seconded the nomination of Grant. He defeated a motion to curtail southern representation in 1884, and in 1904 seconded the nomination of Roosevelt. He was three times elected a member of the Republican national committee. In 1888 he received 105 votes for Vice President in the national convention, and in 1896 was indorsed for President by the Kentucky State convention. In 1889 he declined an appointment as minister to Korea. He was elected Governor of Kentucky in 1895. Prior to 1908 he was four times nominated for United States Senator, and in February of that year was elected, although the General Assembly had a Democratic majority of eight. He was well-known as an eloquent speaker and was one of the most popular orators at national conventions. Only a few days before his death he made a speech of nearly three hours in opposition to the Panama Canal tolls repeal bill. This was considered to be a remarkably strong presentation of the case. He received the degree of LL.D. from Kentucky University. His term in the Senate expired on March 4, 1915. See KENTUCKY.

BRANNON, MELVIN AMOS. An American educator, elected in 1914 president of the University of Idaho. He was born in Lowell, Ind., in 1865 and graduated from Wabash College in 1889. From 1891 to 1894 he studied at the Marine Biological Laboratory at Woods Hole, Mass., and after teaching biology and the natural sciences in several institutions he was in 1894 appointed professor of biology at the University of North Dakota. From 1899 to 1911 he was dean of the school of medicine at that university and was dean of the College of Liberal Arts from 1911 to 1914, being elected president of the University of Idaho, April 1, 1914. Dr. Brannon took the degree of doctor of philosophy at the University of Chicago in 1912.

BRAZIL, UNITED STATES OF. A South American federal republic. The capital is Rio de Janeiro.

AREA AND POPULATION. Estimates of both the

area and the population of Brazil are considerably at variance. Among the estimates of area are 3,292,000 square miles, 3,301,155 square miles, and 3,280,900 square miles. The last figure is equivalent to 8,497,540 square kilometers, the result of a recent planimetric calculation by the University of Agriculture. The 1890 census returned 14,333,915 inhabitants, and the 1900 census 17,318,556; a 1913 estimate placed the number at 24,308,219. Some authorities regard the last figure as too large. The estimated area in square kilometers and estimated population by States, as officially published in 1913, are as follows (State capitals are shown in the last column):

	Sq. km.	Pop.	Capitals
Amazonas	1,894,724	500,000	Manáos
Pará	1,149,512	760,000	Belém
Maranhão	459,884	600,000	São Luiz
Piauí	301,797	450,000	Theresina
Ceará	104,250	1,000,000	Fortaleza
Rio Grande do Norte	57,485	480,000	Natal
Parahyba	74,781	650,000	Parahyba
Pernambuco	128,395	1,650,000	Recife
Alagoas	58,491	800,000	Maceió
Sergipe	39,090	500,000	Aracajú
Bahia	426,427	2,560,000	São Salvador
Espírito Santo	44,839	430,000	Victoria
Rio de Janeiro	68,982	1,250,000	Nichtheroy
São Paulo	290,876	3,200,000	São Paulo
Paraná	251,904	570,000	Curytiba
Santa Catharina	43,585	510,000	Florianopolis
Rio Grande do Sul	286,553	1,750,000	Porto Alegre
Minas Geraes	547,855	4,850,000	Bello Horizonte
Goyaz	747,311	302,996	Goyaz
Matto Grosso	1,378,783	800,223	Cuyabá
Federal District	1,116	1,000,000
Acre Territory	191,000	195,000
Total	8,497,540	24,308,219

The urban populations of Brazil are so variously estimated that, until a census is taken, little dependence can be placed upon published figures. The official estimate for the city of Rio de Janeiro, Jan. 1, 1914, was 984,570.

The total number of immigrants to Brazil from 1820 to the end of 1913 is reported at 3,333,169. Immigration in 1913 was 192,684. The tendency for immigrants to settle in the Southern States, where the climate is most healthful, is shown in the fact that 78,208 disembarked at Rio de Janeiro and 110,976 at Santos. Of the total for 1913, the government assisted 63,023 financially in securing their passage to Brazil. The following table shows by nationalities the immigrants in 1912 and 1913, and the total number in the seven years 1907-13:

	1912	1913	1907-13
Portuguese	76,530	75,665	324,431
Spaniards	35,492	40,540	164,332
Italians	31,785	30,875	145,016
Syrians, etc.	7,302	10,658	38,213
Russians	9,193	8,375	46,195
Germans	5,738	7,356	30,431
Japanese	2,909	7,122	11,868
Austro-Hungarians	3,045	2,218	21,100
French	1,513	1,420	7,899
British	1,077	706	6,033
Others	5,603	8,249	49,771
Total	180,182	192,684	845,289

EDUCATION. The great mass of the population remains illiterate, but in recent years a considerable impetus has been given to primary edu-

cation, which is free and, in some States at least, nominally compulsory. The constitution empowers the federal government to develop the arts and sciences, but public instruction must be secular; to further industrial education the federal government may aid a State government or a municipal or private school which meets requirements. There is some provision for secondary education; secondary schools in 1909 were stated to number only 327, with 30,258 pupils. The government maintains schools of art, agriculture, and technics. While Brazil has no university, there are faculties of law, medicine, and engineering in several of the large cities. Celebrated for their medical faculties are Rio de Janeiro and Bahia, and for their law faculties, Bahia, Recife, and São Paulo. Schools of all kinds in Brazil number upwards of 13,000, with an enrollment estimated at nearly 750,000.

PRODUCTION. The Brazilian crop of first commercial importance is coffee, which is grown principally in the State of São Paulo; it is also of considerable importance in other States, especially Rio de Janeiro, Espirito Santo, and Minas Geraes. Next to coffee in commercial importance is rubber, which grows wild in the Amazon region, and the cultivation of which is encouraged by the government. A law of 1912 exempts from duty implements and material for use in the culture, gathering, and refinement of rubber; demonstration farms are conducted to promote the culture, and bounties are granted to cultivators. Other valuable crops are sugarcane, produced chiefly in Pernambuco and other parts of the Northeast; cotton, of which probably 50,000 to 60,000 tons are produced annually, also largely in the Northeast; yerba maté (herva matté), about 50,000 tons a year, chiefly in Paraná; cacao, 30,000 to 40,000 tons, produced especially in Bahia; tobacco, notably in Bahia and Rio Grande do Sul; corn, rice, bananas, and manioc. The last named forms a staple food of the people. Stockraising, which is fostered by the government, has recently received an impetus by a large investment of foreign capital. Figures (which seem to be excessive), were published in 1914 placing the number of horses in Brazil at 7,289,690; cattle, 30,705,400; sheep, 10,649,000; goats, 10,000,000; mules and asses, 3,207,940, and swine, 18,500,000. Mining is not widely developed though many districts are rich in minerals; there is some production of gold, manganese, gems, and monazite sand.

Manufacturing has developed remarkably in the last twenty years, especially in the Federal District and to a considerable degree in the States of São Paulo, Rio de Janeiro, Rio Grande do Sul, Paraná, Pernambuco, Sergipe, Bahia, and Ceará. The industry of prime importance is the manufacture of cotton-piece goods. The other leading industrial products include woolen goods, sugar, dried meat, boots and shoes, fermented and distilled liquors, sacking, tobacco, matches, hats, tanned leather, and earthenware. A report published in September, 1914, stated that the economic prosperity of the preceding four years had been temporarily checked. Particularly since September, 1913, the country had suffered a financial, industrial, and commercial crisis from which there were only slight signs of recovery. The crisis was due largely to a sharp decline in the price of coffee and rubber;

there was a consequent reduction in imports and customs revenue, occurring at a time when the government was heavily obligated to local and foreign contractors and when the stringency in the European money market made loans difficult to obtain at reasonable rates.

COMMERCE. In the special trade, imports and exports of merchandise are reported as follows, in thousands milreis (paper):

	1909	1910	1911	1912	1913
Imports:	598,967	718,863	793,716	951,370	1,007,495
Exports:	1,027,773	939,413	1,008,925	1,119,787	972,731

In American money the paper milreis may be considered as worth 32.4 cents. At this rate the imports and exports of merchandise in 1912 amounted to \$308,243,736 and \$362,794,846 respectively; in 1913, \$326,428,509 and \$315,164,687. The imports and exports of specie and foreign bank notes were 75,052,000 and 21,628,000 milreis paper in 1912, and 18,727,000 and 87,987,000 in 1913. The leading imports include iron and steel manufactures, machinery, railway materials, cotton goods, flour, coal, wine, arms and ammunition, codfish, kerosene, jerked beef, and paper. The weight (in metric tons) and the value of the principal exports are reported as follows:

	Metric tons		Value	
	1912	1913	1912	1913
Coffee ...	724,818	796,047	\$225,992,915	\$197,936,296
Rubber ..	42,286	36,232	78,125,250	50,861,161

ore ...	154,870	122,300	1,115,079	880,572
Brazil nuts			2,122,163	797,306
Sugar ...	4,772	5,367	272,086	314,507

The coffee export is reckoned in bags of 60 kilos each or in metric tons (1000 kilos); the fluctuations in this export may be seen in the following figures: in 1900, 8,920,469 bags; in 1901, 14,759,845; in 1902, 12,157,383; in 1903, 19,927,239; in 1904, 10,024,536; in 1905, 10,820,651; in 1906, 13,965,800; in 1907, 15,680,172; in 1908, 12,658,457; in 1909, 16,880,696; in 1910, 9,723,738; in 1911, 11,257,802; in 1912, 12,080,303; in 1913, 13,267,449. In 1910 the rubber export amounted to 38,547 metric tons; in 1911, 36,547. Very noticeable is the increase in the cotton export of 1913 over that of 1912. Methods of cotton culture are most antiquated; there seems little doubt that with proper cultivation Brazil would soon become one of the foremost cotton-exporting countries of the world.

The special trade by countries is reported as follows, in thousands of dollars:

	Imports		Exports	
	1912	1913	1912	1913
United Kingdom	77,616	79,881	43,066	41,702
Germany	53,018	57,044	51,928	44,392

	Imports		Exports	
	1912	1913	1912	1913
United States ..	48,109	51,290	141,915	102,563
France	27,751	31,940	35,515	38,686
Argentina	23,117	24,294	14,229	14,848
Belgium	16,580	16,679	9,729	8,093
Portugal	14,589	14,328	7,769	1,589
Italy	12,096	12,866	4,096	4,067
Uruguay	7,718	7,047	4,161	5,167
Austria-Hungary	4,895	4,928	18,258	15,206
Switzerland ...	3,860	3,844
Newfoundland ..	2,854	3,825
Netherlands	2,305	2,587	22,981	23,253
Total, including other	308,244	326,429	362,795	315,165

Of the total importations of merchandise, the United Kingdom furnished 25.2 per cent in 1912 and 24.5 per cent in 1913; Germany, 17.2 and 17.5; United States, 15.6 and 15.7; France, 9.0 and 9.8; Argentina, 7.5 and 7.4; Belgium, 5.4 and 5.1; Portugal, 4.7 and 4.4. The share of the port of Rio de Janeiro in the imports in both 1912 and 1913 was 39 per cent; Santos, 26.1 and 27.1; Pernambuco, 5.5 and 6.0; Belém, 5.0 and 4.3; Bahia, 5.5 and 5.4; Porto Alegre, 3.7 and 3.7. During the first six months of 1914, imports declined about 40 per cent as compared with those of the same period in 1913.

SHIPPING. The tonnage entered at Brazilian ports increased from 16,737,832 in 1907 to 21,405,174 in 1910 and 26,505,884 in 1912. In 1913 there were entered at the ports 27,782 vessels, of 29,170,179 tons, of which sailing vessels were 6295, of 606,266 tons. Brazilian vessels numbered 20,905, of 10,343,968 tons, of which sailing vessels were 5743, of 251,195 tons. Brazilian steamers numbered 15,162, of 10,092,773 tons, and foreign steamers 6325, of 18,471,220 tons. British tonnage entered was 9,866,817 (of which, sail 64,375); German, 4,285,095 (31,366); French, 1,306,102 (9790); Italian, 1,124,068 (34,949); Austro-Hungarian, 556,958; Dutch, 550,390 (242). The North American shipping entered was only 10 steamers, of 24,240 tons.

COMMUNICATIONS. The reported length of railway open to traffic on Dec. 31, 1913, was 24,580 kilometers (15,273 miles); of these, lines belonging to and managed by the Federal government comprised 3522 km. (2188 m.); lines belonging to the Federal government and leased to private companies, 9218 km. (5727 m.); lines conceded by the Federal government, some with and some without guarantee of interest, 5558 km. (3454 m.); lines operated by private companies under concessions of State governments, 6282 km. (3903 m.). Brazilian railway open to traffic has developed as follows: 1854, 14.5 km.; 1870, 745 km.; 1880, 3398 km.; 1890, 9973 km.; 1900, 15,316 km.; 1905, 16,781 km.; 1910, 21,467 km.; 1911, 22,287 km.; 1912, 22,887 km.; 1913, 24,580 km.

During 1914 a railway of considerable importance was opened between Itapura on the Rio Paraná and Porta Esperanza near Corumbá, the most important city of the State of Mato Grosso. Ferryboats effect communication between Porta Esperanza and Corumbá, both of which towns are on the Rio Paraná, and the new line will result in direct communication between the Southern part of the State of Mato Grosso and the State of São Paulo, reducing the time of the journey between Rio de Janeiro and Corumbá to six days, in place of a trip by water involving a voyage of from six to eight weeks. In 1914 there were in operation in the Brazilian

State of Rio Grande do Sul 1,489 miles of railway and about 200 miles more were to be opened to traffic before the end of 1914. The financial condition in Brazil, which was bad in 1913, improved in 1914, and had its effect on the operation of the various railway companies. The Brazil Railway Company incorporated in 1906 was operating directly some 3280 miles of railway in Southern Brazil, and in addition had a large interest in the Paulista and Mogyana Railways which had 1795 miles of line in the State of São Paulo. In 1913 all rail communication between São Paulo and Montevideo was established by the completion of the bridge over the River Uruguay and of the connection with the Central Uruguay at Sant' Anna. In 1914 a total of 471 miles of line controlled by the South American Railway Construction Company was in operation in Brazil and the same company was building 29 miles of the line from Fort Aleza to Macapa, 3 miles on the branch from Ico, 31 miles from Fort Aleza to Itapico, 21 miles from Camocim to Therezina and 12 miles from Amaracao to Campo Nair, a total of 96 miles, being actually under construction. In addition to this the company had plans to build 709 miles of approved proposed line. Originally, railway building in Brazil aimed at establishing communication between an interior productive region and the nearest seaport. Thus developed several unconnected systems. Recife is the focus of one system, Bahia of another, Rio de Janeiro of a third, São Paulo and Santos of a fourth, and Rio Grande do Sul of a fifth. The desirability of connecting these systems has in recent years become increasingly apparent. Rail connection has been established between the ports of Natal and Maceió, through Recife. Farther south construction has been greater. Railway is in operation from the port of Victoria to Rio de Janeiro, São Paulo (and Santos), Porto Alegre, and Rio Grande do Sul. The railway has been extended to the frontier, connecting with the Uruguayan system; before the close of 1913, travel by rail was possible between Rio de Janeiro and Montevideo (3165 kilometers, 1967 miles). Steamers regularly ply the Amazon, Negro, Purús, Madeira, Tocantins, São Francisco, and other large rivers.

As reported for 1911, there were 58,257 kilometers (36,199 miles) of telegraph line, with 117,682 km. of wire and 2187 offices; also 11 radiotelegraph stations, and 28 on board ship. The federal telegraph on Jan. 1, 1914, had in operation 34,430 km. (21,394 m.) of line, with 740 offices. Radiotelegraphy is developing rapidly. Pursuant to a decree of Feb. 19, 1913, the following radiotelegraph stations were established: Belém, with a 4000-mile range, for communication with the United States and the north; Cape Santa Marta, with same range, for communication with the south and Capetown; Rio de Janeiro, 2000 miles, for the coast and interior; the islands of Fernando de Noronha and Trinidad, each 2000 miles. Other stations, chiefly for the marine service, are at Maranhão, Fortaleza, Olinda (State of Pernambuco), Bahia, São Thomé, Florianopolis, Cape Frio, and Rio Grande do Sul. In addition, there are 24 stations on the large rivers, and others are projected. Brazil has adopted standard time and the longitude of Greenwich (instead of that of Rio de Janeiro) from Jan. 1, 1914.

FINANCE. The gold milreis is worth 54.6

cents. The paper milreis fluctuates between 31.5 cents and 33.5 cents, its par value being 32.444 cents. The aggregate expenditure as estimated for the several ministries for 1914 was 70,-179,809 milreis gold and 420,923,469 milreis paper; in addition, there was an application of special revenue, making the total estimated expenditure 95,469,809 milreis gold and 435,773,-469 paper. The estimate for the ministry of finance was 52,618,843 milreis gold and 108,-970,679 paper; communications and public works, 10,662,059 and 124,160,037; marine, 2,900,000 and 42,154,754; war, 250,000 and 71,978,543; justice, interior, and public instruction, 15,119 and 47,552,499. Public debt, Dec. 31, 1912: Foreign, £81,447,520 and 299,032,000 francs; internal, 685,289,200 milreis paper; floating, 274,-377,568 milreis paper; paper money in circulation, 607,025,525 milreis.

ARMY. According to the law of January, 1908, military service is compulsory from 21 years of age to 45, yet the permanent army is recruited mainly by voluntary enlistments with deficiencies in numbers supplied by lot. Two years are spent in the ranks, 7 in the reserve, 7 in the territorial army, and 8 in the National Guard, periods of training and rifle practice being provided for reservists and men of the territorial army. The army is made up of 15 regiments of infantry, each of 3 battalions, 12 battalions of rifles, 12 regiments of cavalry of 4 squadrons, and 5 regiments of 2 squadrons, 5 regiments of field artillery of 9 4-gun batteries, 9 horse artillery batteries, 5 howitzer batteries, 6 mountain batteries, 5 battalions of engineers, and 9 battalions of garrison artillery. The republic is divided into 13 territorial districts, each generally supplying a rifle battalion, and the territorial division is observed in formation of strategic brigades located in the South near the southern frontiers. The total peace strength is about 23,500. There is a gendarmerie of 20,000.

NAVY. The Brazilian navy in 1914 included the following vessels: Two battleships (*Minas Geraes*, 1908; *São Paulo*, 1909), aggregating 38,500 tons; two armored coast guards (*Deodoro*, 1898; *Floriano*, 1899), 6320 tons; two monitors (*Pernambuco* and *Maranhão*, 1905), 940 tons; two scout cruisers (*Rio Grande* and *Bahia*, 1909), 6200 tons; one protected cruiser (*Barroso*, 1896), 3450 tons; three torpedo cruisers (*Tupy*, 1896, and *Tamoyo* and *Tymbira*, 1898), 3090 tons; ten torpedo-boat destroyers (1908-10), 6500 tons. In addition, there were river gunboats, transports, dispatch boats, school ships, and several obsolete vessels. The programme under which the dreadnoughts *Minas Geraes* and *São Paulo* were built provided for a third battleship, the *Rio de Janeiro*. This vessel was launched at Elswick Jan. 22, 1913; in the autumn of that year, the Brazilian government announced that the battleship did not harmonize with the fleet and would be sold. The ship was sold to Turkey, receiving the name *Sultan Osman I*. It was completed in 1914, but did not join the Turkish fleet before the outbreak of the war, when it was taken over by the British government and renamed *Agincourt*. The vessel has a displacement of 27,500 tons, a main battery of 14 12-in. guns, 20 6-in. guns, 3 torpedo tubes, 45,000 indicated horsepower, a speed of 22½ knots, and a complement of 1100.

GOVERNMENT. The constitution bears date of

Feb. 24, 1891. The Federal Congress consists of the Senate and the Chamber of Deputies. Senators, elected by direct vote for nine years, number 63, three for each State and the Federal District. There are 212 Deputies elected for three years. The President, who is elected by direct vote for four years and is ineligible for the succeeding term, is assisted by a cabinet of seven ministers appointed by and responsible to himself. For the term Nov. 15, 1910–Nov. 15, 1914, the President was Marshall Hermes da Fonseca; Vice-President, Wenceslao Braz Pereira Gomes. In March, 1914, the Vice-President was elected to the presidency for the four-year term beginning November 15. Urbano dos Santos was elected as the new Vice-President.

The Brazilians, with elective governors and legislatures, have a large degree of autonomy. The Federal District is administered by an elective council and a prefect appointed for four years by the President.

HISTORY. The presidential elections in March, 1914, resulted in an easy victory for Vice-President Wenceslao Braz, who was elected for the term beginning Nov. 15, 1914. Disturbances had interfered with the elections in the State of Ceara, and it had been necessary to proclaim martial law in Rio de Janeiro, Nictheroy, and Petropolis, in order to prevent outbreaks of the insurrectionary elements. In April the president-elect published a summary of his policy, in which he dealt with such varied topics as national defense, coffee, rubber, stock-breeding, cocoa, iron, immigration, the encouragement of cotton-growing, and railway construction. In his presidential message, at the opening of Congress on May 4, he took cognizance of the recent visits of Prince Henry of Prussia, and Colonel Theodore Roosevelt, as well as of the "A B C" mediatory conference at Niagara. (See MEXICO, *History*.) He was emphatic in urging a policy of severe economy and retrenchment, on the ground that in no other way could Brazil extricate herself from her present financial difficulties.

The decline in the price of coffee and rubber was the fundamental cause of Brazil's financial embarrassment, and the financial stringency was all the more keenly felt because of the extravagant and optimistic course hitherto pursued. One of the most alarming symptoms of the financial condition was the failure of three railways in the rubber district, with liabilities of \$25,000,000, held mostly by French investors. Considerations of economy were not powerful enough, however, to prevent the government from deciding to order a new dreadnought of 30,000 tons from Armstrong, Whitworth & Co. to replace the *Rio de Janeiro*, which had been sold to Turkey; nor was the Brazilian Congress deterred by motives of thrift from authorizing a European loan of \$125,000,000. See also INTERNATIONAL ARBITRATION AND PEACE, *Bryan-Wilson Treaties*.

BREEDING. See STOCK-RAISING.

BREMNER, ROBERT GUNN. Member of Congress from New Jersey, died Feb. 5, 1914. He was born in 1873 at Keiss, Scotland. As a boy he came with his parents to America settling on a farm at Camilla, two miles north of Toronto. In 1893 he removed to Chicago where he worked as an electrician at the world's fair. Two years later he engaged in newspaper work in Paterson, N. J. At the outbreak of the Spanish-American War he enlisted in the Second New

Jersey Volunteer Infantry and after the war closed returned to Paterson. Here he continued his newspaper work and in 1902 became editor and publisher of the *Passaic Herald*. He was a close friend of President Wilson and was one of the chief aids of the former in his campaign for the Governorship of New Jersey. In 1912 he was elected to Congress and occupied a seat in the House of Representatives until his death. Public attention was attracted to him through the attempt to save him from death from cancer by application of radium. Previous to his illness he had earnestly advocated, in the House of Representatives, government ownership of radium-bearing lands.

BRENT, CHARLES HENRY. An American Protestant Episcopal bishop, elected in 1914 Bishop of the diocese of New Jersey. He was born in Newcastle, Ontario, in 1862, and was educated at Trinity College, Toronto, where he graduated in 1884. He was made a deacon in 1886 and priest in the following year. He was assistant minister at St. Paul's Cathedral in Buffalo until 1888, when he went to Boston as rector of the Church of St. John the Evangelist. He became associate rector of the parish of St. Stephen's in Boston in 1901, and in the same year was elected Bishop of the Philippine Islands at a general convention. His work in the Philippines was noteworthy. He labored untiringly in his immense diocese, but found time to assist in public affairs. He was made chief commissioner of the United States and member of the International Opium Commission which took up the study of the use of opium in the Far East. His work in that connection was so valuable that he was made chairman of the United States delegation to the International Opium Conference at The Hague in 1911. In addition to these duties he found time to engage in religious literary work. He was on the editorial staff of the *Churchman* from 1897 to 1900, and was the William Belden Noble lecturer at Harvard in 1907. He succeeded John Scarborough (q.v.) as Bishop of New Jersey. His published writings include: *With God in the World* (1899); *The Consolations of the Cross* (1902); *The Splendor of the Human Body* (1904); *With God in Prayer* (1907); *Leadership* (1908); *A Glorious Ministry* (1910); *The Sixth Sense* (1911).

BRESLAU. See NAVAL PROGRESS.

BRETHREN, CHURCH OF THE (also known as Dunkers or Dunkards). There are three groups of this denomination—the Conservatives, Progressives, and the Old Order. The first are the most numerous, numbering in the United States and Canada in 1914, about 95,000 communicants, 1000 congregations, and 3060 ministers. The Progressive church is second in point of numbers, with 20,500 communicants, 215 churches, and 192 ministers. The Old Order keep no record, but are presumed to number about 4000, with 72 congregations, and 216 ministers. The Conservatives have ten schools, one of them Bethany Bible School, in Chicago, devoted exclusively to Bible work. At Elgin, Ill., they have one of the largest denominational publishing houses in the West, and publish a number of papers and books. Mission work is carried on in Denmark, Sweden, India, and China. As soon as it is safe to enter Palestine, Eld. Galen B. Royer, Secretary of the General Mission Board, will proceed to Jerusalem to

open up mission work in that city. The conference for 1914 was held at Seattle, Wash. The conference for 1915 convenes at Hersey, Pa., June 8. The Progressive Brethren maintain a college and publishing house at Ashland, Ohio. In addition to these branches, there is also a small body known as the Seventh-Day German Baptist Brethren, which has about 250 communicants, 11 churches and 8 ministers. It is located in the vicinity of Ephrata, Pa.

BREWING. See LIQUORS.

BRICK. See CLAY-WORKING INDUSTRIES.

BRIDGES. Bridge construction in 1914 proceeded in an orderly way with continued work on a number of notable structures, and but a few large and important projects were under way. As a result of the European War there was rather more demolition than construction to be recorded in Europe, and for the more notable structures of the year attention was directed to the United States. The bridge problem in America has involved the reconstruction and the reinforcement of practically every large bridge erected since 1880, due to increased traffic, and increased weights of rolling stock. Furthermore, in bridges near cities the growth of suburban and other rapid transit has also been a contributing source to this end. The Williamsburg Bridge at New York City required considerable reinforcement in order to strengthen it for the extra traffic it was to bear, and typical of this operation was the replacement of four 10-inch carbon steel pins by 13-inch pins of nickel-steel, this materially increasing the strength and capacity. In the same way it was found desirable to increase the capacity of another bridge leading from Manhattan Island, namely the Queensboro Bridge, by the rearrangement of tracks and floor system, and the plans considered for this purpose involved an estimated expenditure of over \$3,000,000. Likewise the Brooklyn Bridge, which was among the first to be reinforced, was a subject of study, and the plans considered the entire replacement of the suspended structure. In connection with the reconstruction and replacement of bridges it was found necessary to do this on a large scale for railway bridges, and a favorite method was to construct a new bridge by the side of the old bridge, and when completely finished roll the former into place. A construction of this kind was the bridge of the Pennsylvania Railroad over the Muskingum River when three 240-foot double-track through spans, aggregating in weight 3500 tons, were moved laterally a distance of 44 feet in 10 minutes and 17 seconds between trains. A similar method was also applied in the reconstruction of the Ohio Connecting Bridge below Pittsburgh, when 11 new 175-foot double-track deck spans, weighing 600 tons each, were placed without the interruption of traffic.

QUEBEC BRIDGE. At the end of the year it was reported that the Dominion Bridge Company was making rapid progress on the new Quebec Bridge, and that the piers having been completed, 42 per cent of the steel had been fabricated, and 18 per cent erected, so that the bridge probably would be finished on time and within the original cost estimate.

An interesting method of construction was planned for the 640-foot double-track suspended span, which has a weight of 6400 tons. The method selected was to float this part of the

structure into position and then raise it bodily to a height of 150 feet above the water to its final position.

It is stated that the steel falsework alone weighed 3000 tons, and the steel travelers, 220 feet high, weighed nearly 1000 tons each, while a 90-ton girder crane was employed in the field storage yard. Toward the end of the year about one-third of the 65,000 tons of steel required for the bridge had been fabricated and about 10,000 tons erected, 410 tons of steel being erected in a single day with the driving of 16 large pins, which was claimed as a world's record in bridge construction, and at the end of the year one of the anchor arms had been nearly completed, the piers of course having been finished much earlier.

The Quebec Bridge has a channel span of 1800 feet between pier centres, thus being the largest bridge in the world, but at the same time there were novelties in the design, fabrication, and erection, to which the attention of engineers were directed. The design, a straight chord K-truss, was practically unknown in America, notwithstanding its advantage for long span bridges, and for it was claimed convenience in erection, freedom from secondary stresses, and the distribution of the various trusses. Furthermore, in its details many ingenious schemes had been worked out, so that the construction was really epoch-making in American bridge building.

HELL GATE BRIDGE. Work proceeded during the year on the construction of the approaches for the Hell Gate Bridge, which was being built by the New York Connecting Railway across Hell Gate, connecting Long Island with the mainland. This bridge has a span of 977.5 feet between centres of the end hinges and is the largest bridge of this type in the world. It will have a total weight of steel in the arch proper of 20,000 tons, and a number of new features. At the end of the year the temporary anchors for erecting the arch cantilever fashion had been almost completed, and preparations for a similar installation on Ward's Island were in progress so that the erection of the arch could be begun in April, 1915, after which about 4 months' time would be required for its completion. The entire bridge and approaches it was expected would be finished in 1916.

Plans were made during the year for the Chesapeake and Ohio Railway to cross the Ohio River at Sciotoville by Gustav Lindenthal, the designer of the Hell Gate Bridge and other notable bridges. This was a double-track structure about 3500 feet in length with two 775-foot channel spans. All riveted continuous girders over three supports will be used for the main trusses, as there is a rock foundation at the side, so that instead of two independent spans a much more economical method of construction is available. During the year the work on the foundations was started. In the Middle West a contract was awarded for the steel superstructure of the Memphis cantilever bridge across the Mississippi River, with a maximum span of about 790 feet, designed by Ralph Modjeski, and this new structure will supplement the existing bridge nearby. A contract was also awarded during the year for the Metropolis Bridge across the Ohio River, designed by C. H. Cartlidge, with a maximum span length of about 723 feet between pier centres.

PROPOSED PROJECTS. In addition to actual

construction and design during 1914 a number of large projects for future erection were under construction. These included a 2880-foot span, truss-cable suspension bridge across the North River, and a cantilever bridge across San Francisco Bay, with three 2000-foot spans. At New Orleans a 1071-foot cantilever bridge across the Mississippi River was once more discussed; and plans were under way for a 1600-foot cantilever bridge across the mouth of Sydney Harbor, Australia. The latter bridge was designed for a live load of 15,000 pounds per foot of bridge, which was nearly 50 per cent higher than that deemed necessary for the Quebec Bridge, while a life of 100 years was estimated for the steel work. The Parliamentary Public Utilities Commission entrusted with the examination of the spans reported in favor of a design for a special triangular truss in preference to one with a K-truss.

Discussion continued regarding the construction of a bridge across the North River from Manhattan Island to New Jersey, one proposition being that the bridge should be constructed by private capital and leased to such railroads as desired it and the States of New York and New Jersey, one-half of the cost being assumed by the railways and one-half by the States. The structure proposed under this plan was to have two decks, one carrying eight railway tracks and the other to be used for highway traffic. There would be a central span of 3000 feet carried by main towers, each about 600 feet in height.

In Great Britain the most notable construction was the new Southwark bridge, which was being built with massive blocks of granite. At the end of the year the approaches of this structure, which was described in the YEAR BOOK for 1913, were practically completed, and it was believed that it would be finished within the time specified in the contract. A new road bridge over the River Esk on the road from Carlisle to Glasgow was built during the year. It was carried on ferro-concrete arches supported on red freestone foundations with a central arch span of 175 feet and shore spans of 147 feet. The Kingston bridge was widened during the year from 25 to 55 feet, providing a carriage-way 35 feet wide and a foot-way 10 feet wide either side.

The Sara Bridge spanning the lower Ganges was practically completed by the end of the year and was to be opened early in 1915. The cost of this bridge was said to be £1,250,000. This bridge was described in the YEAR BOOK for 1912. Another interesting bridge in India spans the Goombee River at Lucknow, consisting of five 75-foot arch spans constructed of mixed brick, stone and reinforced concrete.

BRITISH COLUMBIA. A province of the Dominion of Canada. Area, 355,855 square miles, with a population (1911) of 392,480; an increase of 119.7 per cent over that of 1901—178,657. The capital is Victoria, with (1911) 31,660 inhabitants; Vancouver had 100,401, and New Westminster 13,199. The province is administered by a lieutenant-governor, appointed by the Governor-General of Canada and acting through a responsible executive council of seven members. There is a unicameral legislative assembly of 42 members directly elected for four years. Thomas W. Paterson, appointed Lieutenant-Governor in 1909, was succeeded in 1914

by Frank Barnard. Premier in 1914, Sir Richard McBride. See CANADA.

BRITISH EAST AFRICA. See EAST AFRICA PROTECTORATE, UGANDA, and ZANZIBAR.

BRITISH GUIANA. A British colony, including the settlements of Demerara, Essequibo, and Berbice, lying to the east of Venezuela on the northeastern coast of South America. The capital is Georgetown. Area, 90,277 sq. miles; population (1911), 296,041 (98,154 in 1841). Unenumerated aborigines were estimated at 10,000. The East Indian immigrant population on estates March 31, 1912, numbered 9453 under indenture, 39,283 not under indenture, and 18,159 children; not residing on estates, 62,494: total immigrant population, 129,389. The birth rate in 1907 was 28.3, and the death rate 36.9, per thousand inhabitants. The chief product is sugar (which forms 76 per cent of the export trade); there are 43 sugar estates in active operation, with a total area of 156,666 acres, of which 67,888 are under sugar, 5196 under plantains, etc., and the remainder pasture or uncultivated. The bulk of the sugar produced for export is known as Demerara crystals; 77,821 tons were exported during 1912, besides 2,384,182 pf. gallons of rum, 176,061 gallons of molasses, and 5116 tons of molascuit. On the lowlands about 42,000 acres are under rice; export in 1912, 6,159,429 lbs., valued at £38,720. The forests abound in valuable woods. The country is rich in gold; 48,779 ozs. were exported in 1912, valued at £177,968. Diamond export in 1912, 5229 carats, valued at £6861. Other exports in 1912 were balata, £101,547; timber, £13,090; firewood, £3669; shingles, £2281; lumber, £2467; charcoal, £7487. About half of the trade is with the United Kingdom. The imports for the year 1912 were valued at £1,703,355, and the exports at £1,798,597; including £71,563 transit. Customs revenue 1912—13, £336,907. Public debt, March 31, 1913, £884,615. The revenue for the year 1912—13 amounted to £580,446 (£593,498 in 1911—12), and the expenditure to £590,745 (£588,625). The colony is administered by a Governor (Sir W. Egerton in 1914), assisted by an executive council and a court of policy.

BRITISH HONDURAS. A British colony on the east coast of Central America, south of Yucatan, on the Caribbean Sea. The capital is Belize, with 10,478 inhabitants. Area, 8598 sq. miles, of which about 80 sq. miles are under cultivation. Population, April 2, 1913, 41,170. The schools, with a few exceptions, are denominational, inspected, and government-aided. Average attendance, 3837. The climate is subtropical. Wood-cutting is the chief industry; 16,019,932 superficial feet of mahogany, 2,638,811 superficial feet of cedar, and 3662 tons of logwood were exported in 1912. Other important exports are bananas, 470,039 bunches in 1912; plantains, 3,341,425; coconuts, 6,553,539; sapodilla gum, 3,309,277 pounds; rubber, 20,722 pounds; sponges, 10,488 pounds; tortoise-shell, 3627 pounds. The total imports in 1912 were valued at \$3,496,908 (\$2,886,677 in 1911), and the exports at \$2,856,043 (\$2,685,849). Total customs revenue for 1912—13, \$297,644. Total tonnage entered and cleared in 1912—13, 630,064 (538,367 in 1911—12). The revenue for 1912—13 was \$575,243 (\$1,201,908 in 1911—12, including revenue from loans); expenditure, \$611,131 (\$532,123). Public debt, \$946,415. The colony

BRIDGES

is administered by a governor (Wilfred Collet in 1914), assisted by an executive and a legislative council.

BRITISH INDIA. See INDIA, BRITISH.

BRITISH NEW GUINEA. See PAPUA.

BRITISH NORTH BORNEO. A British protectorate under the jurisdiction of the British North Borneo Company, including the whole of the northern portion of the island of Borneo from the Sipitong River on the west to lat. 4° 10' N. on the east coast, together with adjacent islands. It is held under grant from the Sultans of Brunei and Sulu. It covers an area of 31,000 square miles, with a coast line of about 900 miles. The inhabitants numbered in 1911 about 208,000—Bruneis, Illanuns, Bajaus, and Sulus on the coast; Dusuns and Muruts in the interior. There are about 30,000 Chinese who carry on cultivation in the flat coast areas. Europeans number about 400. Sandakan is the chief town, and with suburbs has a population of 12,000. There are mission schools.

Agriculture has advanced beyond the primitive stage. Tobacco is a valuable crop, the export in 1908 amounting in value to nearly \$3,000,000. Other products for export are tapioca, gambier, pepper, rubber, tea, sago, coffee, rattans, beeswax, camphor, damar, cattle, and cutch. There is a profitable timber trade with China and Manila. Some coal is worked; large deposits of iron ore have been discovered, and oil belts exist on the west coast. Imports for the year 1912 were valued at 5,476,214 Straits Settlements dollars and exports at 5,692,275 dollars respectively; in 1911 at 4,603,071 and 4,836,795. Total tonnage entered and cleared, 385,331, of which 128,146 tons British; in 1911, 353,308 tons, of which 118,206 tons British. A meter-gauge railway extends from Brunei Bay to Beaufort, 20 miles; and from Beaufort to Jesselton, 57 miles. There is also a line from Beaufort to Tenom, 33 miles. Internal communication is mostly by water. Wireless stations are in course of construction at Sandakan, Jesselton, Lahad Datu, and Sebatik.

The revenue for the year 1912, inclusive of land sales, amounted to 1,508,285 dollars and the expenditure to 915,690 dollars; in 1911, 1,366,768 and 829,251. The revenue is derived from import and export duties, stamps, royalties, poll tax; licenses for the sale of opium, spirits, and tobacco; and from the sale and rent of forest and other lands.

The appointment of the Governor (C. W. C. Parr in 1914) is subject to the approval of the Secretary of State. The laws are based on the Indian code, with an Imam's court for Mohammedan law. There is a native military force under European officers.

BRITISH SOMALILAND. See SOMALILAND PROTECTORATE.

BRITISH SOUTH AFRICA. See SOUTH AFRICA, UNION OF.

BRITISH WEST AFRICA. A collective name for the following British colonies and protectorates in Western Africa: NIGERIA, including the colony and protectorate; GOLD COAST COLONY, including Ashanti and the northern Territories; SIERRA LEONE, including the colony and the protectorate; and GAMBIA, including the colony and the protectorate. See these separate titles.

BROOKS, JAMES BYRON. American lawyer and educator, died June 17, 1914. He was born

in Rockingham, Vt., in 1839, and graduated from Dartmouth College in 1869. He studied law at the Albany Law School, receiving the degree of LL.B. in 1871. Previous to this he had served in the Civil War, reaching the rank of captain. He was wounded in the Battle of the Wilderness in 1864 and was discharged from the service on account of this wound. From 1872 until the time of his death he was engaged in the practice of law in Syracuse. He held several offices in the administration of that city and from 1895 until his death he was dean in the College of Law at Syracuse University. He was a member of several bar associations.

BROWN, CHARLES RUFUS. An American theologian and educator, died Feb. 2, 1914. He was born in East Kingston, N. H., in 1849, and graduated from the United States Naval Academy in 1869. He served in the navy from 1870 to 1875, when he entered Harvard College, graduating in 1877. He then studied law at the Newton Theological Institution and the Union Theological Seminary, and took post-graduate studies at the universities of Berlin and Leipzig. He was ordained to the Baptist ministry in 1881 and for two years was pastor at Franklin Falls, N. H. In the latter year he was appointed associate professor of Biblical interpretation at the Newton Theological Institution. He became professor of Hebrew and cognate languages at this institution in 1886 and held this post until his death. He was also professor of Hebrew and cognate languages at the University of Chicago in the summer quarter of 1897, and in 1905 and 1906 was acting professor of Hebrew and Old Testament exegesis at the Boston University School of Theology. In 1910 he was resident director of the American School of Oriental Research in Jerusalem. His published writings include: *An Aramaic Method* (1884, 1893); *The Book of the Prophet Jeremiah* (new translation, 1906); *Commentary on Jeremiah* (1907). He also contributed on theological subjects to reviews.

BROWN, THERON. An American clergyman and editor, died Feb. 14, 1914. He was born at Willimantic, Conn., in 1832, and graduated from Yale College in 1856. He studied theology at the Hartford Theological Seminary and at the Newton Theological Institution in Massachusetts until 1870, when he joined the staff of the *Youth's Companion* and remained on the editorial staff of that paper until his death. His published writings include: *The Red Shanty Series* (1875 to 1878); *Stories for Sunday* (1877); *Life Songs* (poems, 1894); *Nameless Women of the Bible* (1904); *Under the Mulberry Tree* (a novel, 1909); *The Birds of God* (1911).

BROWN UNIVERSITY. An institution for higher education, founded at Providence, R. I., in 1764. The students in the autumn of 1914 numbered 1012, of whom 910 were undergraduate and 102 graduate students, and there was a faculty numbering 77. There were several changes in the faculty during the year 1914-15: among these was the promotion of R. M. Mitchell and H. F. Micoleau, formerly instructors, to assistant professors; J. H. Appleton retired and was appointed Professor Emeritus; professors N. F. David and L. T. Damon were granted leaves of absence for the year, and H. E. Bigelow and P. B. Perkins (new men) were appointed assistant professors. There were no

noteworthy benefactions received during the year. The number of volumes in the main library was 205,000. The president is W. H. P. Faunce, D.D.

BRUSILOF EXPEDITION. See **POLAR RESEARCH, Arctic.**

BRYANT, JOSEPH DECATUR. An American surgeon, died April 7, 1914. He was born in East Troy, Wis., in 1845, and received his early education at the Norwich (N. Y.) Academy. He studied medicine at the Bellevue Hospital Medical College, receiving the degree of M.D. in 1868. After serving for several years in Bellevue Hospital as an interne, he became in 1871 assistant to the chair of anatomy in the Bellevue Hospital Medical College. He became lecturer on surgical anatomy, assistant demonstrator of anatomy, professor of general descriptive and surgical anatomy, professor of anatomy and clinical surgery, and associate professor of orthopedic surgery in that college. From 1898 until his death he was also professor of the principles and practice of surgery and of operative and clinical surgery at the University and Bellevue Hospital Medical College. From 1873 to 1879 he was sanitary inspector of the New York City Health Department, and was Commissioner of the New York State Board of Health from 1873 to 1879, and from 1887 to 1893. He was attending and visiting surgeon in many of the important hospitals of New York City. He was much interested in militia affairs, and in 1873 became surgeon of the Seventy-first Regiment. In 1882 he was appointed by Governor Cleveland Surgeon-General of the State. Dr. Bryant became widely known as an intimate friend and companion of President Cleveland, whose personal physician he was. He received an honorary degree of LL.D. from New York University in 1908, and he was a member of many medical and scientific societies. He was the author of medical monographs, and of *Operative Surgery* and *Bryant and Buck's American System of Surgery*.

BRYN MAWR COLLEGE. An institution for the higher education of women, founded at Bryn Mawr, Pa., in 1885. The number of students enrolled on Nov. 15, 1914, was 439, including 72 graduates, with a faculty and teaching staff numbering 62. The benefactions for the year 1913-14 included an addition of \$2670 to the endowment fund from the Bryn Mawr College Undergraduate Association; \$5000 addition to the scholarship funds from Mr. Alexander Simpson of Philadelphia; \$10,000 addition to the Current Expenses Funds for scholarships, fellowships, and other current expenses by Miss Mary E. Garrett, of Bryn Mawr. During the year two associate professors of education on the Phebe Anna Thorne Foundation, established in 1913, were appointed. Six teachers were also appointed on the Model School staff, and the first class of this school was opened with 20 children, who will receive a seven years' course of preparation for college. The productive funds of the college at the end of the college year 1913-14 amounted to \$1,884,323 and the income to \$75,258. The library on Oct. 1, 1914, contained 74,293 volumes. The president is M. Carey Thomas, Ph.D., LL.D.

BUBONIC PLAGUE. See **PLAGUE.**

BUCKNER, SIMON BOLIVAR. An American soldier, died Jan. 8, 1914. He was born in Hart County, Ky., in 1821. In 1844 he graduated

from the United States Military Academy at West Point and was appointed Second Lieutenant. In the following year he was appointed assistant instructor in ethics at the Military Academy, but served only a short time before the Mexican War broke out. He took an active part in this war and was brevetted for gallantry in several engagements. From 1848 to 1850 he was assistant instructor in infantry tactics at West Point, and was promoted to be captain and was made commissary of subsistence in 1852. In 1855 he resigned from the army and practiced law until the outbreak of the Civil War. He was made commander of the State Guard of Kentucky, and in 1861 issued an address to the people calling upon them to take up arms against the Union. After the battle of Fort Donelson he commanded a Confederate brigade and on Feb. 16, 1862, surrendered the fort to General Grant. He was in prison at Fort Warren, Boston, until exchanged in August, 1862. He was later made a major-general and commanded a grand division at the battles of Murfreesboro and Chickamauga. He surrendered with Kirby Smith's army to General Osterhaus at Baton Rouge on May 26, 1865. After the close of the war he resumed the practice of law and soon became prominent throughout Kentucky, where in 1887 he was elected Governor. He was a candidate of the gold Democratic party for Vice-President in 1896, running on the ticket with John M. Palmer of Illinois. He was one of the pallbearers at General Grant's funeral. It was through General Buckner's request at Fort Donelson that General Grant became known as "Unconditional Surrender Grant." In reply to Buckner's inquiry as to what terms he would receive if he surrendered, Grant replied, "No other terms than an unconditional surrender can be accepted. I propose to move immediately upon your works." Grant and Buckner had been at West Point together and had always remained firm friends. General Buckner was the last surviving major-general of the Confederacy at the time of his death.

BUCKWHEAT. Buckwheat, although valuable, is a minor crop in all countries and data regarding its production are not generally published. It is largely grown as a catch crop and the acreage devoted to it is determined to a considerable extent by seasonal conditions. The production of buckwheat in the United States in 1914 as reported by the Department of Agriculture amounted to 16,881,000 bushels. This crop was grown on 792,000 acres, making the average yield 21.3 bushels per acre. These figures represent a decrease in area of 13,000 acres and an increase in production of more than 3,000,000 bushels as compared with the crop of the year before, when the average yield per acre was only 17.2 bushels. Based on the prices paid farmers on Dec. 1, 1914, which averaged 76.4 cents per bushel, the value of the crop amounted to \$12,892,000, the highest during the past 45 years. New York and Pennsylvania continued to be the leading buckwheat States, their production representing almost one-half of the total production of the country. Michigan, Ohio, Virginia, West Virginia, and Wisconsin rank next in the production of this crop, but none of these States produces over one-fifth the quantity produced in either New York or Pennsylvania. In about one-half of the States buckwheat is grown in such small quan-

titles that the production does not enter into the crop returns. In sections where farmers are familiar with its culture and where seed is readily obtainable, buckwheat is used as a green manure to supply vegetable matter to the soil. Experiments conducted by the Connecticut Experiment Station during the year showed that the crop ranked high in the production of dry vegetable matter.

BUFFALO, N. Y., CHARTER. See MUNICIPAL GOVERNMENT.

BUILDING. See ARCHITECTURE; FINANCIAL REVIEW.

BUILDING OPERATIONS. On account of the financial and commercial conditions prevailing in the United States during 1914, building operations fell off materially in amount from 1913. Nevertheless, conditions were better than were generally supposed, and the returns from the leading cities in the United States, received and compiled by the *Engineering News*, were of unusual interest in view of the financial depression. The least percentage of shrinkage was shown in the Central States, where returns from 154 cities with a population of 26,664,539, or about half the urban population of the United States, show that plans were filed in 1914 for buildings estimated to cost \$771,017,852, as compared with \$838,945,302 in 1913. In the Eastern States 59 cities reported plans filed in 1914 aggregating \$326,957,204 as compared with \$366,084,621 in the previous year, and in the Central States there were filed in 46 cities plans calling for construction estimated at \$290,281,422 as compared with \$292,128,028 in 1913. In the South in 30 cities 1914 operations were estimated to involve \$57,532,371 as compared with \$66,572,691 in the previous year. A heavy loss was to be noted on the Pacific Coast, especially at Los Angeles, Cal. In 19 cities the building returns in 1914 called for \$96,246,855 of new construction as compared with \$114,159,962 in 1913. The returns for the more important cities of the United States are given in the accompanying table.

BUILDING OPERATIONS IN THE U. S. 1913 AND 1914

Statistics of Plans Filed. Compiled by *Engineering News*

EASTERN STATES

* Census of 1910.

BULGARIA. One of the "Balkan States"; a constitutional European monarchy. The capital is Sofia.

AREA AND POPULATION. Previous to the Balkan War the area and population (the *de facto* population according to the census of Dec. 31, 1910) were as shown in the table below.

	Area		Pop.
	Sq. kl.	Sq. m.	1910
Bulgaria, Northern	63,751.1	24,614	3,095,785
Eastern Rumelia	32,594.4	12,585	1,241,778
Total Bulgaria	96,345.5	37,199	4,337,513

By the treaty of Constantinople, signed Sept. 29, 1913, the Turco-Bulgarian frontier was defined. The new frontier follows the course of the Maritza from its mouth to Mandra, where it crosses the railway and runs north and slightly west, passing close to Ortakeui, which remains Bulgarian. Thence the line goes to Lefke, almost due north of Mustapha Pasha. From Lefke the line runs to the nearest point of the old Turco-Bulgarian boundary, which is followed as far as the neighborhood of Kaibilar. From Kaibilar it runs east to the mouth of the Reavaya at Sveti Stefan, with a slight deviation southward so as to leave the Malka Tirnov district to Bulgaria. The Rumano-Bulgarian frontier starts from the Danube above Turtukar and ends on the Black Sea, south of Ekrene. The Serbo-Bulgarian frontier starts from the Partarica Mountain, continues along the old Turco-Bulgarian frontier and the watershed between the Varda and the Sturma (the upper valley of the Strummtza remaining Servian), and ends at the mountain of the Belash-

ictza. The Græco-Bulgarian frontier starts on the crest of the Belashictza range and ends at the mouth of the Nestor at the Aegean Sea.

Of the total population in 1910, 3,497,794 were Bulgarians, 466,117 Turks, 121,435 Tziganes, 79,787 Rumanians, 43,273 Greeks, 40,118 Jews, 21,145 Pomacs, 18,050 Tartars, 12,914 Armenians, etc. Sofia had, in 1910, 102,812 inhabitants; Varna, 47,981 inhabitants; Ruschuk, 36,255; Slivno, 25,142; Shumla, 22,225; Plevna, 23,049; Philippopolis, the capital of Eastern Rumelia, 47,981. There were in 1911, 41,868 marriages, 176,909 living births, and 74,860 deaths. No statistics for the movement of the population are given for the year 1910.

EDUCATION, ETC. Primary education is free and nominally compulsory, with fees in higher grades only, these fees being confined to the rich. The State supplies two-thirds, local taxation one-third, of the cost of primary instruction; one-half of the cost of secondary instruction is borne by the State. Foreign schools are numerous, special and technical schools few. There were in 1910-11, 4674 elementary schools, with 8686 teachers and 453,592 pupils. There is a university at Sofia, with three faculties; attended in 1911-12 by 2260 students, of whom 217 were women.

The national religion is the Orthodox Greek, but the Bulgarian Church is not included in the Orthodox communion. Of the total population in 1910, 3,643,951 belong to the Orthodox church, 32,130 to the Roman Catholic Church, 12,270 were Gregorian Armenians, 6252 Protestants, 40,070 Jews, 602,101 Mohammedans.

AGRICULTURE. Agriculture is the occupation of about five-sevenths of the population. Of the total area, 3,130,279 hectares in 1909 were under cultivation, 742,498 were fallow—total, 3,872,777 hectares. Of the total area under cultivation, 2,394,252 hectares were planted to cereals, 523,371 to forage plants, 85,240 to vines, 60,259 to potatoes and other roots, 25,231 to melons, etc., 13,215 to industrial plants, 11,088 to legumes, 8277 to orchards and gardens, and 7621 to rosefields. The following table shows main crops with area and yield in 1910-11 and 1912-13, with yield per hectare in 1912-13:

	Hectares			Quintals	Qs.
	1911-12	1912-13	1911-12	1912-13	ha.
Wheat	1,120,500	1,030,000	17,850,000	16,500,000	16.0
Rye	215,000	185,000	3,150,000	2,750,000	14.9
Barley	260,000	230,000	4,000,000	3,500,000	15.2
Oats	160,000	170,000	1,750,000	2,000,000	11.8
Corn	650,000	650,000	14,000,000	11,500,000	17.7
Rice	8,000	8,000	80,000	35,000	17.7

In 1905 there were 2,167,275 cattle, 8,081,816 sheep, 536,616 horses, 124,216 asses, 11,828 mules, 1,370,201 goats, and 463,241 swine.

Besides the coal mines at Pernik, coal has been found near Trevna. Iron in large quantities, gold, silver, lead, manganese, and copper are found. About 1,000,000 cubic meters of stone are quarried annually. Woolen goods, cottons, cord, and cigarettes are manufactured.

COMMERCE AND COMMUNICATIONS. The commercial statistics which follow are from an English source and are given in pounds sterling. Import and export values for three years:

	1910	1911	1912
Imports	£7,094,268	£7,973,792	£8,524,408
Exports	5,162,088	7,385,856	6,257,264

The leading imports in 1912 were cattle, £117,288; cereals, £116,692; building timber, £557,988; machinery, implements, etc., £1,051,836; textiles, £2,737,276; hides, skins, leather, etc., £529,004. The principal articles of export were wheat, £1,787,904; corn, £295,924; live stock, £70,168; silk cocoons, £56,788; hides, skins, etc., £107,044; attar of roses, £464,828.

Trade by principal countries is given below, with values in thousands of pounds sterling.

	Imports		Exports	
	1911	1912	1911	1912
	£	£	£	£

Vessels entered in the 1911 trade, 18,818, of 4,951,452 tons; cleared, 18,792, of 4,934,559.

There were in operation in 1913, 1384 miles of railway; under construction, 239 miles. State telegraph wires (1911) 9453 miles, with 374 telegraph stations. Telephone lines, 1383 miles, with 7297 miles of wire. Post offices, 2245.

FINANCE. The lev, worth 19.3 cents, is the monetary unit. In the table below, in pounds sterling, are given revenue and expenditure for three successive years.

	1911	1912	1913
Revenue	£7,137,812	£7,610,920	£5,765,344
Expenditure	7,135,818	7,557,200	4,732,832

The debt stood, Jan. 1, 1914, at £35,145,572.

ARMY. With the termination of the wars in the Balkans in 1913, the Bulgarian army which was recruited by conscription, was maintained ready for any possible emergency, which political developments in Europe might bring about. The war estimates for 1914-15 were 52,972,503 francs, or an increase over those of the preceding year of nearly 13,000,000 francs, an amount which was made necessary by the increased territory resulting from the late war and the expense and deficiency resulting therefrom. For the new territory in Thrace a new infantry division, No. 10, was to be created, and the 40 existing infantry regiments in 1914 which had each two battalions were to be increased by a third, of two companies, to be formed from the cadres then existing. All of the regiments of cavalry were to be made up to four squadrons each, and to each a machine gun detachment was to be allotted. The entire cavalry force was to be organized in three brigades. The artillery was to be given 15 new field batteries, and one new horse battery, the latter on mobilization forming a part of the horse artillery brigade to be attached to the cavalry. To the 12 existing mountain batteries eight new ones were to be added, and the whole was to be organized in three regiments. The fortress artillery was also to be increased by three brigades. The Bulgarian army in previous years had suffered from the fact that their field guns, while of modern quick-firing type, were

not supplied with smokeless powder. In the earlier battles, and also at Tschataldja they were unable to locate the Turkish artillery, so that the latter guns gained the preponderance. While they were sometimes more successful against the Turkish infantry, yet they gave no decided support to their own infantry who acted impetuously, so that there was no real coöperation. These defects of tactics and material were being remedied in 1914.

GOVERNMENT. Bulgaria has been an independent monarchy since Oct. 5, 1908, when Prince Ferdinand assumed the title of King of the Bulgars. Eastern Rumelia is now an integral part of Bulgaria under the administration at Sofia, now the only capital. The executive authority rests in the sovereign acting through a responsible council of eight ministers. He must, except in the case of the present ruler, profess the Orthodox creed, and must reside permanently in the country. Reigning sovereign in 1914, Ferdinand I, born Feb. 26, 1861; married (1) April 20, 1893, to Marie Louise of Parma, and (2) Feb. 28, 1908, to Eleonore of Reuss Köstritz. Heir-apparent, Prince Boris, born Jan. 30, 1894.

The legislative power is vested in a single-chamber (Sobranje), whose members number one to every 20,000 of the population and who are elected by universal manhood suffrage. The ministry, first appointed July 20, 1913, and re-appointed Jan. 5, 1914, was composed as follows: Dr. V. Radoslavoff, Premier and Minister of the Interior, and Minister for Foreign Affairs *ad int.*; Dr. D. Tontcheff, finance; P. Pecheff, instruction; Gen. C. Bovadjieff, war; J. Bakaloff, commerce; Dr. P. Dintcheff, public works; N. Apostoloff, railways.

HISTORY. After having tendered on January 2 the resignation of his cabinet, and after having been promptly reappointed by King Ferdinand, M. Radoslavoff on January 12 read to the Sobranje his ministerial declaration of policy, wherein he promised to pursue a peaceful policy, although with no intention of abandoning the claim for a revision of the treaty of Bucharest; to meet the financial situation he proposed new taxation, a foreign loan of \$50,000,000, and an issue of treasury bonds; the burden of taxation would be shifted to the wealthier classes by means of taxes on income and capital; and a Parliamentary inquiry would be instituted for the purpose of ascertaining the causes of Bulgaria's disaster in the Balkan War of July, 1913, the persons who were responsible for that disaster, and the extent to which public funds had been maladministered during the war. M. Tontcheff, as Minister of Finance, then proposed what amounted to a vote of confidence in the government, a vote of two months' supplies. This being refused, the Premier, with the authorization of the King, immediately dissolved the Sobranje.

The ensuing general elections resulted in the return of 123 Ministerialists, 50 Agrarians, 28 Democrats, 21 Socialists, 9 Nationalists, 5 Radicals, and 3 Zankovists, thus giving the government a clear majority of 12 votes. An extraordinary session of Parliament was called for April 2 to deal with the Budget, to authorize a loan, and to ratify the treaties of Bucharest and Constantinople. On May 8 a motion was proposed in the Sobranje to institute a Parliamentary Commission to inquire how far the Gueshoff and Daneff cabinets had been respon-

sible for the calamitous war of the previous summer. The ensuing debate was memorable in many respects: it made the fact manifest that all parties in Bulgaria were anxious to increase the strength of their country; and it brought to light not a few interesting circumstances connected with the Balkan War. Evidence was adduced to prove that if the Gueshoff government had so desired it could have made peace immediately after the battle of Lule Burgas, since Kiamil Pasha was then ready to consent to the Enos-Midia frontier. Dr. Daneff, in a four-hour speech, affirmed that Gueshoff's ministry had twice unsuccessfully attempted to bring Rumania into the Balkan Alliance; Dr. Daneff also declared that he had no information about an order given General Savoff to precipitate the Balkan War in 1913. Dr. Gennadieff, leader of the Stambolovists, delivered a remarkable three days' oration, in which the sad events of 1913 were masterfully reviewed, and the Bulgarian people urged to strive without discouragement for the greatness of their native land. Finally a Commission of thirty members was appointed by the Sobranje to investigate the culpability of the politicians who conducted Bulgaria into the fratricidal conflict with Greece and Servia. The ministers in question were, as a result of the Commission's findings, not found guilty of penal offenses, but neither were they cleared of all blame.

Meanwhile a state trial before the State Tribunal, had been proceeding along somewhat similar lines and had likewise yielded interesting disclosures regarding the Balkan War. Strictly speaking, the attention of the State Tribunal should have been confined to the period 1903-08, when the Stambolovist party was in power, for it was during that period that the five defendants—General Savoff (several times minister of war, commander-in-chief during the first Balkan War), General Ratcho Petroff (premier 1900-01, 1903-06), Dr. Gudeff (premier 1907-08), Dr. Gennadieff (various cabinet offices), and M. Halatcheff—were alleged to have misused public funds and committed various corrupt practices. But during the proceedings, subsequent events were brought into discussion, and important statements were made, especially by General Savoff, who declared that he had disapproved the withdrawal of the Bulgarian troops from Thrace in May, 1913, because he anticipated a renewal of hostilities by Turkey, but had effected the withdrawal at the insistent command of the king and cabinet. In June, obedient to the ministry's behest, he had carefully prepared a plan of campaign against Greece and Servia, according to which he would have captured Nish within a week; then suddenly, on July 1, he had been superseded in command by General Radko Dimitrieff, who had conducted the July war to its disastrous issue.

On July 1, the anniversary of the outbreak of the second Balkan War, a demonstration was held in Sofia by the Broad Socialists, Radicals, and Agrarians, who condemned monarchism as responsible for the fatal error. On July 12, M. Tontcheff signed a loan agreement with a group of German bankers, whereby Bulgaria would receive a loan of \$100,000,000 (interest at five per cent, rate of issue at 84). In return, the German banks would receive the concession for the Porto Lagos-Haskovo railway, and two other railways, with a guarantee of 10 per cent profit

on the capital, and the right of developing the Pernik coalfields conjointly with the Bulgarian Government. The question of securing the Sobranje's ratification for this agreement speedily became a political issue of the first magnitude when the Opposition decided to combat the German loan, and the Russian Legation issued a semi-official *communiqué* stating that a group of French banks were prepared to grant the loan to Bulgaria without exacting the sweeping industrial concessions which the Germans demanded. The Russians were accused of entering even more openly into Bulgarian politics by holding conferences of the Opposition leaders at the Russian Legation for the purpose of naming a new cabinet. So acute was the situation, that when the loan was submitted to the Sobranje on July 15, the precaution was taken of placing special police guards around the hall. The sitting was thrown into turmoil when the leader of the "Narrow Socialists" loudly accused the bourgeois Opposition parties of acting as the dupes of Russia. Nor would the Opposition allow the sitting to be resumed in an orderly fashion, but overturned desks, flung books through the air, and shouted incessantly until a hasty and undignified adjournment was taken. At a subsequent sitting the ministerial party succeeded in casting its solid majority vote in favor of the German loan agreement, and on July 17 a Royal Ukase gave formal sanction to the measure.

The lingering resentment with which Bulgaria continued to regard Greece after the second Balkan War was manifested on June 3, when the Greeks were celebrating the name day of their King, Constantine, and an angry mob of Bulgarians in Sofia tore down the Greek flag from the Greek church. In Varna the mayor himself led an attack on the four Greek churches and schools in that city. For these affronts the Bulgarian Premier communicated formal apologies to the Greek government; at the same time he requested Greece to abandon the harsh policies which drove thousands of Bulgars from Greek Macedonia into Bulgaria, where they stirred up hatred against Greece. It was hoped that Græco-Bulgarian relations might be improved by the resumption of diplomatic relations between Greece and Bulgaria, which took place on July 24, when the Greek minister plenipotentiary, M. Naoum, arrived at Sofia, and the Bulgarian minister, M. Passaroff, took up his duties in Athens.

There was also some bitterness against the neighboring state of Rumania as the consequence of the recent war. In the slice of the Dobrudja which Rumania had taken from Bulgaria, Bulgarian churches were being Rumanized; and numbers of discontented Bulgarians from this region came to spread the tale of their woes in Bulgaria. Both governments, however, seemed to be animated by a sincere desire for peace, and they exhibited a most commendable calmness in discussing two frontier accidents which occurred in July. Announcement of an extremely important event in the history of Bulgaria's relations to Rumania was reported to have emanated from the Bulgarian minister at Petrograd late in December; Rumania, he was credited with saying, had arranged to restore to Bulgaria the portion of the Dobrudja annexed by the former country after the second Balkan War. Of what diplomatic negotiations this decision was the

result, and of what international developments it might be taken as the harbinger, no information was vouchsafed.

Immediately after the outbreak of the war between Austria-Hungary and Serbia (July 28), Dr. Radoslavoff informed the Democratic leader, M. Malinoff, that Bulgaria would maintain strict neutrality. To this policy the Opposition strongly rallied. A few days later, the Premier declared before the Sobranje that, (1) Bulgaria would be neutral, (2) that the border incidents with Rumania had been satisfactorily settled, (3) that relations with Turkey were friendly, (4) that relations with Greece were not bad, (5) that the policy of the cabinet was purely Bulgarian. The Chamber then voted a military credit of \$30,000,000 in addition to \$50,000,000 for requisitions made during the Turco-Balkan and Balkan Wars. On October 28 the Narodne Sobranje was convened for its 17th regular session. The Speech from the Throne not only reiterated the assurance of Bulgaria's neutrality, but proposed to take up the regular work of legislation as if no war were in existence. Bills were foreshadowed, (1) for accident insurance, (2) for the pensioning of laborers employed by the State, (3) for assuring safer conditions of labor, and (4) for guaranteeing the payment of laborers' wages.

The entry of Turkey into the War of the Nations early in November caused a certain amount of apprehension regarding the attitude which Bulgaria might take. During the last year persistent rumors had affirmed the existence of a secret Turco-Bulgarian understanding or alliance against the other Balkan nations. Before Turkey's declaration of war Bulgaria had laid herself open to charge of having infringed neutrality by permitting 600 German marines to pass through Bulgarian territory *en route* for Constantinople, it being notorious that these Germans were destined for the Turkish navy. Of this charge the Bulgarian government easily cleared itself. And a few days after Turkey took up arms, M. Radoslavoff quieted all apprehensions by declaring that Bulgaria had no treaty obligations binding her to fight in aid of Turkey, and would remain neutral. Bulgaria's neutrality, he said, was now desired by both the Triple Alliance and the Triple Entente, although earlier in the war both groups had essayed to involve Bulgaria.

BUMPUS, HERMON CAREY. An American educator, elected in 1914 president of Tufts College. He was born in Buckfield, Me., in 1862, and graduated from Brown University with the degree of Ph.D. in 1884, taking post-graduate studies at Clark University. From 1886 to 1889 he was professor of biology at Olivet College, and in the latter year was appointed fellow at Clark University, serving for one year. He became assistant professor of zoölogy at Brown University in 1890 and in the following year was appointed associate professor, one year later becoming professor of comparative anatomy at this university, holding the chair until 1901. During the same period he was director of the biological laboratory of the United States Fish Commission at Woods Hole, Mass., and until 1902 was assistant to the president and curator of the department of invertebrates of the American Museum of Natural History in New York. From 1902 to 1911 he was director of this museum, in the

latter year being appointed business manager of the University of Wisconsin, which position he held at the time of his election as president of Tufts College. From 1905 to 1911 he was a member of the faculty of pure science at Columbia University. Dr. Bumpus received the degree of LL.D. from Clark University in 1909, is one of the best known of American scientists, and is a member of many American and foreign scientific societies. He is the author of *A Laboratory Course in Invertebrate Zoölogy* (1893), and numerous monographs and articles on biological subjects.

BURDETTE, ROBERT JONES. An American clergyman, humorist, and lecturer, died Nov. 19, 1914. He was born in Greensboro, Pa., in 1844, but removed in boyhood to Peoria, Ill. He was educated in the public schools. After engaging in several unsuccessful mercantile enterprises he entered journalism in 1870 as night editor of the *Peoria Transcript*, subsequently held the editorship of another paper in the same city, and then became a member of the staff of the *Burlington Hawkeye*. His contributions to this journal gained him a wide reputation as a humorist. At the same time he contributed to the *Brooklyn Eagle* and to the *Los Angeles Times*. In 1876 he began his career as a lecturer and followed this with great success, for many years traveling all over the United States. He then resumed his literary work and his humorous articles were widely syndicated in the papers of the country. In 1903 he was ordained as a minister in the Baptist denomination, and started the Temple Baptist Church in Los Angeles, where he served as pastor until 1909, when he was made pastor emeritus, being incapacitated for work by an injury to his spine through a fall. For several years he served as city commissioner of Pasadena, Cal. His published writings, which had a wide circulation, include: *Hawkeyetems* (1877); *The Rise and Fall of the Mustache*; *Hawkeyes* (1879); *Chimes from a Jester's Bells*; *Smiles Yoked with Sighs* (1900); *The Silver Trumpets* (poems, 1911); *Old Time and Young Tom* (1912). He was a member of several learned societies.

BUREAU OF SOCIAL HYGIENE. See PROSTITUTION.

BURLEIGH, BENNET. An English war correspondent and writer, died June 17, 1914. He was born in Glasgow, Scotland, in 1844, and when still a young man came to the United States and took part in the Civil War on the Confederate side. He was twice captured and sentenced to death. He represented the *Central News* throughout the first Egyptian war and was present at the battle of Tel-el-Kebir. In 1882 he joined the staff of the *Daily Telegraph* and represented that paper in the second Egyptian war. He also reported the French campaign in Madagascar and accompanied the desert column from Korti Metammah in 1884. He was correspondent for the *Daily Telegraph* with the Ashanti expedition, in the Spanish Riff campaign, in the Greek war, with the Abara expedition, in the Egyptian war, in the South African war, the Somaliland war, the Russo-Japanese war, the Tripoli campaign, and the recent Balkan war. He was the author of numerous books dealing with the various campaigns in which he took part. He was the oldest and most widely

known of English war correspondents. His publications include *Two Campaigns*, and *Empire of the East* (1905).

BUTTER. See DAIRYING.

BYWATER, INGRAM. An English Greek scholar, died December, 1914. He was born in London, June 27, 1840. After studying at University and King's College schools, London, he graduated M.A. from Queen's College, Oxford, in 1863. He was then appointed fellow of Exeter College; served as tutor for several years; and became university reader in Greek in 1883. From 1893 to 1908, when he retired, he was regius professor of Greek at Oxford, and a student of Christ Church. He received the honorary degree of Litt.D. from Dublin, Durham, and Cambridge, and that of Ph.D. from Athens. Bywater was one of the great classical scholars of his day. His publications, which deal chiefly with Greek philosophy, include: *Heracleti Ephesi Reliquia* (1877); *Prisciani Lydi quae extant*, edited for the Berlin Academy (1886); *Aristotle's Ethica Nicomachea* (1890); *Contributions to the Textual Criticism of the Nicomachean Ethics* (1892); and a valuable edition of Aristotle's *Poetics* under the title *Aristotelis de Arte Poetica Liber* (1897), which was republished in 1909 as *Aristotle on the Art of Poetry*, with a critical introduction, translation, and commentary.

CADWALADER, JOHN LAMBERT. An American lawyer, died March 11, 1914. He was born in Trenton, N. J., in 1837, and graduated from Princeton College in 1856. He studied law at the Harvard Law School, graduating in 1860, and immediately entered the practice of law in New York City. In 1874 he was appointed assistant Secretary of State under Hamilton Fish in President Grant's Administration, and held the post until 1877. He then returned to his law practice and never again held public office, although he was mentioned for many places of prominence. He, with Charles E. Strong, formed the law firm of Strong and Cadwalader, which continued under this name until Jan. 1, 1914, when the name was changed to Cadwalader, Wickersham and Taft. Cadwalader was at one time president of the Bar Association of the City of New York and was at the time of his death president of the New York Public Library. He worked out the plans for combining the Astor, Lenox, and Tilden Foundations in one great public library and was instrumental in putting the plan in execution. He also had much to do with the creation of the present library building at Fifth Avenue and Forty-second Street. He was a trustee of the Metropolitan Museum of Art, of the New York Zoölogical Society, of the Carnegie Institution of Washington, and of Princeton University. He was also a member of several patriotic and learned societies. He received the degree of LL.D. from Princeton University in 1897, and from the University of Pennsylvania in 1908. He was a benefactor of Princeton and in 1913 made this university a gift of \$30,000.

CALDWELL, ROBERT TOWNLEY. An English scholar and educator, died Sept. 8, 1914. He was born in Barbados in 1843, and received his early education at St. John's College, Winnipeg, Canada, his father being at that time Lieutenant-Governor of Manitoba. While still a young man he removed to England, and in 1862 entered as a pensioner at Corpus Christi College,

Cambridge. In 1865 he was elected to a Fellowship and mathematical lectureship at this college. In 1871 he became Bursar of the college and for nearly thirty years managed the estates and finances of that institution. In 1892 he resigned his lectureship and his Bursarship lapsed in 1899. In 1906 he was elected Master of Corpus, and in this position he carried through many reforms which were greatly needed to modernize the teaching of the college. For many years he was commander of the Third Gordon Highlanders with the rank of colonel. He received degrees of LL.D. from Cambridge and Aberdeen Universities.

CALIFORNIA. POPULATION. The estimated population on July 1, 1914, was 2,757,895. The population in 1910 was 2,377,549.

AGRICULTURE. The area, production, and value of the principal crops in 1913-14 are shown in the following table. The figures are from the United States Department of Agriculture, and those of 1914 are estimates only.

		Acreage	Prod. bu.	Value
Corn	1914	60,000	2,160,000	\$1,879,000
	1913	55,000	1,815,000	1,597,000
Wheat	1914	400,000	6,800,000	7,072,000
	1913	800,000	4,200,000	3,990,000
Oats	1914	220,000	7,700,000	4,081,000
	1913	210,000	6,686,000	3,982,000
Rye	1914	8,000	186,000	118,000
	1913	8,000	120,000	90,000
Barley	1914	1,402,000	42,060,000	24,815,000
	1913	1,275,000	33,150,000	22,542,000
Rice	1914	15,000	800,000	800,000
	1913	6,100	293,000	293,000
Potatoes	1914	75,000	10,850,000	7,245,000
	1913	68,000	8,092,000	5,664,000
Hay	1914	2,700,000	a 5,265,000	43,178,000
	1913	2,400,000	3,600,000	48,600,000
Cotton	1914	85,000	b 37,000	1,240,000
	1913	14,000	23,000	1,429,000

a Tons. b Bales.

MINERAL PRODUCTION. California is first among the States west of the Mississippi River and fifth among all the States in the value of its mineral production. Its preëminence during the last ten years has resulted from the large output of petroleum, in the production of which it leads all the other States, furnishing in 1913, 39.36 per cent of the total output in the United States, and 19.28 per cent of the value. Prior to 1903, when petroleum took first place among the mineral products of the State as regards value, gold was the chief mineral product, and although gold has fallen from first place, California continues to lead all the other States in the output of this metal. Moreover, California is one of the few States in which gold production is an important factor that did not show decreased production in 1913. The production of petroleum in 1913 was a little more than 45 per cent of the total mineral output of the State. The record shows an increase in the quantity of crude oil produced of over 10,500,000 barrels, or from 87,268,536 barrels in 1912 to 97,788,525 barrels in 1913. The value increased somewhat more in proportion, from \$39,616,387 to \$45,709,400. Kern County, which contains the Midway, Kern River, McKittrick, Sunset, and Lost Hills fields or districts, is by far the most important county in the production of petroleum, yielding 58 per cent of the total output in 1912 and 60 per cent in 1913. Fresno County, containing the Coalinga field, is second in importance, with 20 per cent of the

total production. The remainder of the output comes from Los Angeles, Orange, Ventura, Santa Barbara, San Luis Obispo, and Santa Clara counties.

The production of gold in 1912 increased from 953,639 fine ounces, valued at \$19,713,478, to 987,187 fine ounces, valued at \$20,406,958 in 1913. Of the total gold production, about 55 per cent is derived from deep mines and about 45 per cent from placers. Third in importance among the mineral industries of the State is the manufacture of Portland cement, in which California ranks third in importance. The production in 1913 was 6,018,262 barrels, a decrease of 75,528 barrels from the production of 1912. The value, however, increased from \$8,215,894 in 1912 to \$8,896,734 in 1913. Other mineral products of great importance are clay and quarry products. California is the only producer of borax, magnesite, and chromic iron ore, and is the leading State in the production of asphalt, platinum, and quicksilver. The combined value of these products in 1913 was about \$4,000,000, of which asphalt and borax contributed more than \$3,200,000. The only other mineral product which had a value of more than \$1,000,000 was natural gas, which showed an increase in value from \$1,134,456 in 1912 to \$1,883,450 in 1913. The other mineral products of commercial importance are coal, feldspar, fuller's earth, gems and gem materials, graphite, gypsum, infusorial earth, iron ore, lead, lime, manganese ore, mineral paints, mineral waters, pumice, pyrite, salt, sand and gravel, sand-lime brick, silver, tungsten ore, and zinc. The total value of the mineral products of the State increased from \$93,219,149 in 1912 to \$100,791,369 in 1913. The mines of the State showed an increased production in gold, silver, lead, and zinc and a decrease in copper in 1914, according to the estimates of the United States Geological Survey. The total value of these metals for 1914 is about \$21,138,500 in gold and 1,987,700 ounces of silver, an increase of \$731,500 in gold and 609,300 fine ounces of silver. California continues to be the first gold-producing State of the country. There were in 1914 about 800 producing mines, of which approximately half were deep mines and half placers of various kinds.

Notwithstanding the condition of the copper market, owing to the European war, during the later months of the year, the copper yield apparently fell off only about 560,000 pounds in 1914, compared with 1913. The estimated yield for the former year was 34,000,000 pounds. The output of lead in 1914 is estimated at 6,484,000 pounds, an increase of nearly 3,000,000 pounds from the production of 1913. Zinc showed an increase in output of about 1,050,000 pounds, or about 2,107,000 pounds.

EDUCATION. The total school population in 1914 was 513,319, including 7808 university students. The total enrollment in the public schools in the same year, including elementary, kindergarten, and high schools was 501,021, with an average daily attendance in these schools of 373,478. The teachers numbered 13,250 women and 2368 men. The average yearly salary of men teachers in the elementary schools was \$1018 and of women \$745, while in the high schools the men's salary was \$1517 and the women \$1125.

FINANCE. On June 30, 1913, the funded debt

of the State consisted of bonds and special debt obligations to the permanent fund of the State university, the total amount being \$10,178,250. The floating debt consisted of outstanding warrants, payable to the treasury of the State and of private trust liabilities. The total receipts for the biennial period July 1, 1910, to June 30, 1912, amount to \$39,323,132, and the disbursements to \$36,620,818, leaving a balance on hand on June 30, 1912, of \$9,903,533. The balance at the beginning of this period was \$7,201,219. The principal receipts are from franchises and from county taxes.

CHARITIES AND CORRECTIONS. The charitable and correctional institutions of the State are the following: Industrial Home for the Adult Blind; Whittier State School; Preston School of industry—all reform schools; Stockton State Hospital; Napa State Hospital; Agus State Hospital; Mendocino State Hospital, and Southern California State Hospital. The State prisons are at San Quentin and Folsom. The total number in all State institutions is about 14,000. The legislature of 1913 provided for a State training school for girls and a new psychopathic State hospital. The State Board of Charities was also given additional duties, including those of licensing maternal hospitals, boarding homes for children, etc.

POLITICS AND GOVERNMENT. The State legislature did not meet in 1914, as the sessions are biennial and the last was held in 1913. In comparison with the previous year, 1914 was comparatively quiet politically, although interest was not lacking on account of the State elections. Agitation on account of the alien land laws passed by the legislature of 1913 had become a national rather than State issue, and whatever developments there were are noted under *Foreign Relations* in the article UNITED STATES.

Governor Johnson was a candidate for renomination on a Progressive ticket, while Francis J. Heney was the Progressive candidate for United States Senator.

The Progressive party in its convention declared for a protective tariff "which shall equalize conditions of competition between the United States and foreign countries," and also urged the establishment of a permanent non-partisan tariff commission, wholly removed from the possibility of political pressure or improper business influence. The Republican platform also declared for an equalization of tariff duties and favored a return to the Republican policies of protection to American industry. In the Democratic platform a declaration was made of faith in the wisdom and patriotism of President Wilson and support was pledged to him in the discharge of his duties; special approbation was given to his Mexican policy, and a declaration was also made for the establishment of an American merchant marine. After one of the most progressive campaigns ever known in the State Governor Johnson was renominated in the primary elections held on August 27. At the same election Francis J. Heney was nominated for the Senate by the Progressives, Congressman Knowland by the Republicans, and James D. Phelan by the Democrats. The Republican and Democratic candidates for governor were Messrs. Fredericks and Curtin. The election of November 3, with a registration of over 1,000,000, was the first important one in

which women of the State took part. The voting on November 3 resulted in the reelection of Governor Johnson by 460,495 votes, compared with 271,990 votes for Fredericks, Republican, and 116,121 votes for Curtin, Democrat. James D. Phelan, Democratic candidate, was elected to the United States Senate, following a close contest in which Knowland was second and Heney, Progressive, third. A proposed Prohibition amendment to the constitution was defeated. As a result of the election the Progressives continued to control the State legislature on a joint ballot of 51.

OTHER EVENTS. A unique departure in legal procedure which caused much comment throughout the country was the appointment of a public defender in Los Angeles County. The duties of this official correspond roughly to those of the public prosecutor, but the public defender may accept cases brought to him by those unable to pay a lawyer in addition to those to which he is assigned by the court. In no case does the public defender undertake cases for those who can pay a private attorney. To fill this office Walton J. Wood, former deputy city attorney of Los Angeles, was appointed.

One of the most interesting events during the year was the outbreak on April 30, of what was supposed to be an extinct volcano, Mt. Lassen, in Northern California, 90 miles south of the Oregon line. On the date mentioned there was a slight disturbance in the crater of the volcano and nearly two weeks later there were eruptions. A series of these culminated on May 14, when clouds of smoke and steam, with stones and ashes, were thrown up. A party of eight men who were near the crater at the time of the explosion narrowly escaped death. (See **VOLCANOES.**) There were serious floods resulting from unusual heavy rainfalls in Los Angeles and other cities in that section of the State in February. These resulted in the death of six persons and the loss of property valued at millions of dollars.

STATE OFFICERS, 1915. Governor, Hiram W. Johnson, Prog.; Lieut.-Governor, A. J. Wallace; Secretary of State, F. C. Jordan; Treasurer, E. D. Roberts; Comptroller, A. B. Nye; Adjutant-General, Edwin A. Forbes; Attorney-General, U. S. Webb; Superintendent of Education, Edward Hyatt; Commissioner of Insurance, E. C. Cooper; Commissioner of Agriculture, R. L. Telfer—all Republicans, except governor.

SUPREME COURT: Chief Justice, W. H. Beatty; Associate Justices, H. A. Melvin, Lucien Shaw, F. M. Angellotti, M. C. Sloss, F. W. Henshaw, W. G. Lorigan; Clerk, B. G. Taylor—all Republicans.

STATE LEGISLATURE, 1915.

	<i>Senate</i>	<i>House</i>	<i>Joint Ballot</i>
Democrats	10	15	25
Republicans	7	33	40
Progressives	23	28	51
Socialist	3	3
Prohibitionists	1	1
Prog. majority ...	6

The representation in Congress will be found in the section *Congress*, article UNITED STATES.

CALIFORNIA, UNIVERSITY OF. A State institution for higher education, founded at Berkeley in 1860, the total enrollment in 1914 being 7526, with 434 in the faculty. The de-

partments of the university include the college, colleges of law, medicine, and pharmacy, the university farm, and the San Francisco Institute of Art. The productive endowment fund amounts to about \$5,000,000 and the income to about \$2,000,000 annually. The library contains about 200,000 volumes and several hundred thousand manuscripts. The president is Benjamin I. Wheeler.

CALMETTE, GASTON. A French journalist and political writer, editor-in-chief and part proprietor of the Paris *Figaro*, killed by Madame Caillaux, wife of M. Joseph Caillaux, French minister of finance, on March 16, 1914. He was born in 1858 at Montpellier, and was educated at the Brest Lyceum, at Bordeaux, and elsewhere. He early entered journalism, and when about 26 years of age became connected with *Figaro*, and soon won wide notice by the vigorous and aggressive character of his writings. He was successively secretary, manager, and editor-in-chief of *Figaro*. His attacks on public men resulted in a number of duels. His political attitude was Moderate Republican, and under his auspices the *Figaro* became one of the leading organs of that party. Calmette was well known as a connoisseur, and owned a fine collection of engravings and caricatures of the First Empire. He received from Spain the decoration of the Grand Cross of the Order of Charles III. His death was the climax of a bitter controversy that had been going on since the beginning of 1914 between him and M. Joseph Caillaux. See *FRANCE, History*.

CAMBODIA. A French protectorate forming part of the colony of French Indo-China (q.v.).

CAMDEN, JOHNSON NEWLON. An American public official, elected in 1914 United States Senator from Kentucky. He was born in Parkersburg, W. Va., in 1865, and was educated at the Episcopal High School in Alexandria, Va., Phillips Academy at Andover, Mass., and the Virginia Military Institute at Lexington, Va. He studied law at the Columbia Law School in New York and was admitted to the bar. He did not, however, practice actively, but engaged in farming and the breeding and raising of fine cattle and thoroughbred horses. He was also interested in the opening and development of coal fields in eastern Kentucky. On June 16, 1914, he was appointed United States Senator to fill the vacancy caused by the death of Senator William O. Bradley (q.v.), his appointment under the law extending until the November election of 1914, at which he was the Democratic nominee for Senator for the unexpired term ending March 4, 1915. He was elected over two opponents, a Republican and Progressive. See *KENTUCKY*.

CAMPBELL, SIR FRANCIS. An English musician and teacher of music, died July 25, 1914. He was born in Winchester, Tenn., in 1832. At three years of age he met with an accident which resulted in the total loss of his sight. At the age of twelve he entered the Tennessee School for the Blind. When he was tested for singing it was found that he could not tell one tune from another, and he was told that he could not study music. He hired a companion to give him lessons on the piano and soon developed a remarkable musical talent. Four years later he became a teacher of music at his old school. In 1858 he settled in Boston and was soon appointed resi-

dent superintendent musical director of the Perkins' Institution for the Blind. He remained in this institution for eleven years, and then went to Germany to study in the Conservatories of Leipzig and Berlin. On his return home through London, he met the late Dr. T. R. Armitage, and the result of that meeting was the establishment of the Royal Normal College and Academy of Music for the Blind. He was principal of this college from 1862 to 1912. In 1909 he was created Knight. He retired from active duty in 1912. He was a noted mountain climber. He ascended Mont Blanc in 1881.

CANADA, DOMINION OF. A British self-governing dependency north of the United States. The capital is Ottawa, in the province of Ontario.

AREA AND POPULATION. The area of Canada is computed at 3,729,665 square miles, divided into nine provinces and Yukon Territory and the Northwest Territories. The following table shows the area of provinces and territories in land and water; the areas of Manitoba, Ontario, Quebec, and the Northwest Territories are adjusted to conform to the Boundary Extension Acts of 1912:

	Land	Water *	Total *
Alberta	252,925	2,860	255,285
British Columbia	353,416	2,489	355,855
Manitoba	231,926	19,906	251,832
New Brunswick	27,911	74	27,985
Nova Scotia	21,068	860	21,428
Ontario	365,880	41,882	407,262
Prince Edward Island	2,184	2,184
Quebec	690,865	15,969	706,834
Saskatchewan	243,882	8,318	251,700
Yukon Territory	206,427	649	207,076
Northwest Tera.	1,207,926	84,298	1,242,224
Canada	3,603,910	125,755	3,729,665

* The water area is exclusive of Hudson Bay, Ungava Bay, the Gulf of St. Lawrence, and all other tidal waters, excepting that portion of the St. Lawrence River which is between Pointe-de-la-Monts in Saguenay and the foot of Lake St. Peter.

By the Boundary Extension Acts (2 Geo. V, cc. 32, 40, and 45) passed by the Dominion Parliament in 1912 (proclaimed May 10 and in force from May 15, 1912), the provinces of Manitoba, Ontario, and Quebec were enlarged by the addition of areas that were previously part of the Northwest Territories. The boundaries of Manitoba were thus extended northwards to the 60th parallel of north latitude between the eastern boundary of Saskatchewan and the western shore of Hudson Bay; and from the point where the northern boundaries of Manitoba and Ontario formerly coincided the boundary of Manitoba was extended due north to a point defined and thence northeasterly to the point where the 89th meridian of west longitude intersects the southern shore of Hudson Bay. The northern boundaries of Ontario were extended to the southern shore of Hudson Bay, the new western boundary of Ontario coinciding with the new eastern boundary of Manitoba. To the province of Quebec was added the whole of the former district of Ungava, so that Quebec includes all of the peninsula of Labrador which is within Canada (the strip along the eastern shore of Labrador is a dependency of Newfoundland). The new district of Ontario is named Patricia. It is bounded on the west by Manitoba, on the south and southeast by the English and Albany Rivers, and on the east and

north by James and Hudson Bays. Pursuant to an order in council dated Feb. 20, 1912, and subject to subsequent enactment by the Dominion parliament of the necessary legislation, Ontario would also possess a strip of territory (then within Manitoba) five miles wide lying between the district of Patricia and the Nelson River and to be located within 50 miles of the shore of Hudson Bay, as well as an area half a mile wide and five miles long to be located along the south shore of the Nelson River. The latter area would be contiguous to the five-mile strip, and together these areas would afford 10 miles of water front for harbor facilities and railway terminals. The land was to be selected and designated by the Ontario government within five years from the date of the order in council.

The following table shows the area, the population as returned by the census of April 1, 1901, the population as returned by the census of June 1, 1911, and the population increase per cent.:

	Sq. mi.	Pop. '01	Pop. '11	Inc.
Alberta	255,285	73,022	374,663	413.08
Brit. Columbia	355,855	178,657	892,480	119.68
Manitoba	78,732	255,211	455,614	78.52
New Brunswick	27,985	331,120	351,889	6.27
Nova Scotia	21,428	459,574	492,388	7.18
Ontario	260,862	2,182,947	2,523,274	15.58
Pr. Edward Isl.	2,184	103,259	98,728	*9.23
Quebec	351,873	1,648,898	2,003,232	21.49
Saskatchewan	251,700	91,279	492,482	439.48
Yukon Ter.	207,076	27,219	8,512	*68.73
Northwest Tera.	1,921,685	20,129	18,451	*8.18
Canada	3,729,665	5,371,315	7,206,643	34.17

* Decrease.

The extent of the changes effected by the Boundary Extension Acts of 1912 is shown below (increase of area, present area, and population adjusted to the 1911 census):

	Inc. sq. m.	Sq. m.	Pop. '11
Manitoba	178,100	251,832	461,680
Ontario	146,400	407,262	2,527,292
Quebec	354,961	706,884	2,005,779
Northwest Territories.	*679,461	1,242,224	5,900

* Decrease, equal to the increase of the three provinces.

The average density of the population, according to the 1911 census, was 1.93 per square mile, calculated upon the total of 3,729,665 square miles. This figure may be compared with the density per square mile of other "new" countries, as, for instance, the United States 30.69, New Zealand 9.63, the Commonwealth of Australia 1.53, and Newfoundland 1.47. Prince Edward Island had a density of 42.91 per square mile; Nova Scotia, 22.98; New Brunswick, 12.61; Ontario, 9.67; Manitoba, 6.18; Quebec, 5.69 (figures for the last three provinces are upon the basis of area as before the changes of 1912); Saskatchewan, Alberta, and British Columbia, each less than 2 per square mile.

In the older parts of the Dominion, there is a marked trend of population from country to town. The following table shows rural and urban population in 1911, with increase and decrease as compared with 1901:

	Pop. 1911		Incr. or decr.	
	Rural	Urban	Rural	Urban
Alberta	232,726	141,937	180,827	121,314
Br. Columbia	188,796	203,684	100,318	118,505

	Pop. 1911		Incr. or decr.	
	Rural	Urban	Rural	Urban
Manitoba	255,249	200,365	70,511	129,892
New Brunswick .	252,342	99,547	—1,493	22,262
Nova Scotia . . .	306,210	186,128	—23,981	56,745
Pr. Edw. Isl. . .	78,758	14,970	—9,546	15
Quebec	1,032,618	970,614	39,951	314,383
Ontario	1,194,785	1,328,489	—52,184	392,511
Saskatchewan . .	361,067	131,365	287,388	113,815
Yukon Ter. . . .	4,647	8,865	—13,480	—5,277
Northw't Terrs. .	18,481	—1,648
Canada	8,925,679	8,280,965	576,163	1,259,165

It should be pointed out that, in the foregoing table, the urban population includes the inhabitants of places who, in some classifications, would have been placed in the rural list. The urban total includes, to the number of 90,284, inhabitants of places with a population less than 500; 180,784 dwelling in towns with a population between 500 and 1000; 429,553 in towns between 1000 and 3000; and 226,212 in towns between 3000 and 5000. At the 1911 census, Montreal had 14.34 per cent of the urban, and 6.53 per cent of the total population of the country; Toronto, 11.48 and 5.22; Winnipeg and Vancouver, 7.21 and 3.28; Ottawa, Hamilton, and Quebec, 7.55 and 3.44; 6 places with between 25,000 and 50,000 inhabitants, 7.35 and 3.34; 13 between 15,000 and 25,000, 7.24 and 3.30; 18 between 10,000 and 15,000, 6.74 and 3.07; 46 between 5000 and 10,000, 9.85 and 4.48; 60 between 3000 and 5000, 6.89 and 3.14; 251 between 1000 and 3000, 13.09 and 5.97; 247 between 500 and 1000, 5.51 and 2.51; under 500, 2.75 and 1.25. Of the total population, 45.53 per cent was urban. The estimated population of the Dominion, March 31, 1914, was 8,075,000.

EDUCATION. Education is under the control of the provincial governments, the cost being met by local taxation, aided by grants from the several provincial governments. Primary instruction is free and, except in Quebec and Manitoba, compulsory. Of the total population (6,319,160 persons of five years of age and over, census of June 1, 1911), 5,622,844 (88.98 per cent) could read and write, 32,863 (0.52 per cent) could read only, and 663,453 (10.50 per cent) could neither read nor write. In 1901 the percentage of illiteracy was 14.38. In the table below will be found the total public, high, and superior schools by provinces, the number of teachers and pupils, and the total provincial expenditure, together with the percentage of illiteracy according to the census of June 1, 1911.

	No. Teachers	Pupils	Expend.	Per cent
Alberta ^a	1,601	3,054	71,044	\$5,387,568 12.72
Br. Columbia ^a	574	1,377	49,968	3,882,488 11.61
Manitoba ^a . . .	2,227	2,774	76,247	4,000,871 13.81
New Brunswick ^a	1,907	2,081	69,586	2,290,741 14.05
Nova Scotia ^a .	2,680	2,861	106,028	1,391,100 10.84
Ontario ^a	6,715	12,586	522,413	12,104,422 6.51
Prince Edw. I. ^a	478	591	17,897	181,177 7.61
Quebec ^a	6,896	13,288	897,060	6,224,146 12.66
Saskatchewan ^a	2,124	3,551	72,250	3,989,036 13.70

^a Government and county fund expenditure only.
¹ Dec., 1911. ² June, 1912. ³ July, 1912. ⁴ June, 1911. ⁵ December, 1910.

The percentage of illiteracy in Yukon was 13.58, and in the Northwest Territories 69.25.

British Columbia. The schools are free and unsectarian; the central control is vested in a

council of public instruction. Schools are established wherever there are 10 children of school age. There are 30 high schools, employing 96 teachers.

Manitoba. A system of national nonsectarian schools was established throughout the province by an act of 1890, which provides that all public schools shall be free schools, and that every person in rural municipalities between the ages of 5 and 21 years, and in cities, towns, and villages between the ages of 6 and 21 years "shall have the right to attend some school." Normal schools are provided, and there is one university, with examining and degree-conferring powers only. The affiliated colleges are St. John's (Episcopal), St. Boniface (Roman Catholic), Manitoba (Presbyterian), Wesley (Wesleyan), and the Manitoba Medical.

New Brunswick. Education is free between the ages of 6 and 20 years. The central control is vested in a board of education, the local management being in the hands of boards of trustees. There are universities at Fredericton, Sackville, and Memramcook.

Nova Scotia. Education is compulsory in towns between the ages of 7 and 12 years. Local technical schools have been established in all the large industrial centres, with a central institution (the Nova Scotia Technical College) at Halifax.

Ontario. Primary instruction is free and compulsory; all schools are required to employ only certificated teachers. There are agricultural, commercial, and classical institutions. There is a provincial nondenominational university at Toronto, with affiliated colleges; besides two nondenominational and two denominational colleges with university powers. The central control is vested in a minister of education, who is a member of the provincial cabinet.

Prince Edward Island. Primary instruction is free, nonsectarian, and compulsory between the ages of 8 and 13 years. There is one higher college amalgamated with the normal school, besides a Roman Catholic college not under government control. There are two private kindergartens, and consolidated schools at Hillsboro and Tryon.

Quebec. The central control is vested in a superintendent of public instruction, assisted by a council of 44 members, who are divided into committees for the separate management of Roman Catholic and Protestant schools. The schools are maintained partly by local taxation and fees, and partly by grants from the provincial government. There are normal, agricultural, commercial, and classical schools; and three universities—McGill College (Protestant) at Montreal, Bishop's College (Protestant) at Lennoxville, and Laval University (Roman Catholic), at Quebec.

AGRICULTURE. Agriculture is the most important industry, and large quantities of cereals are raised for export. The total area estimated as under field crops in the Dominion in 1913 was 35,375,000 acres, as compared with 35,575,000 acres in 1912. The total value of the output from these lands, computed at average local market prices, was \$552,771,500, as compared with \$556,344,100 in 1912. Wheat was grown upon 11,015,000 acres, of which 970,000 acres were devoted to fall wheat with an output of 22,592,000 bushels valued at \$18,185,000; as

compared with 971,000 acres in 1912 producing 20,387,000 bushels valued at \$17,157,000. Spring wheat was planted on 10,045,000 acres, yielding 209,125,000 bushels valued at \$138,277,000; as compared with 10,025,700 acres in 1912, yielding 203,772,000 bushels valued at \$121,933,000. Both the spring wheat and oat crops of 1913 are the highest on record in Canada, spring wheat as regards area, yield, and value; oats as regards area and yield. In the table below are given the area in acres devoted to main crops in 1913, the yield in bushels, and the value:

Crops	Acres	Bushels	Value
Wheat	11,015,000	231,717,000	\$156,462,000
Oats	10,484,000	404,669,000	128,894,000
Barley	1,613,000	48,319,000	20,114,000
Rye	119,300	2,800,000	1,524,000
Peas	218,980	3,951,800	4,882,000
Beans	46,600	800,900	1,505,000
Buckwheat ...	880,700	8,372,000	5,820,000
Mixed grains...	473,800	15,792,000	8,685,000
Flaxseed	1,552,000	17,539,000	17,084,000
Corn *	278,140	16,772,600	10,784,300
Potatoes	473,500	78,544,000	38,418,000
Turnips, etc...	186,400	66,788,000	18,643,000
Tons			
Hay and clover	8,169,000	10,859,000	124,696,000
Fodder corn ..	303,650	2,616,800	12,506,000
Sugar beets ..	17,000	148,000	906,000
Alfalfa	98,560	237,770	2,819,200

* For husking.

In the table below are given area and yield of wheat, oats, and barley in the three north-west provinces for 1912 and 1913. In 1905 the total area under wheat in these provinces was 3,941,369 acres, yielding 82,461,627 bushels; oats, 1,697,170 acres and 68,810,855 bushels; barley, 370,850 acres and 10,971,755 bushels.

		Wheat	Oats	Barley
Manitoba:				
Acres ...	1912	2,839,000	1,848,000	481,000
	1913	2,804,000	1,898,000	496,000
Bushels ..	1912	63,017,000	57,154,000	15,826,000
	1913	53,331,000	56,759,000	14,805,000
Saskatchewan:

Alberta:				
Acres ...	1912	1,590,000	1,461,000	187,000
	1913	1,512,000	1,689,000	197,000
Bushels ..	1912	34,803,000	67,680,000	6,179,000
	1913	34,372,000	71,542,000	6,334,000
Total Northwest Provs.:				
Acres ...	1912	10,011,000	5,865,000	960,000
	1913	10,136,000	5,792,000	1,125,000
Bushels ..	1912	204,280,000	242,221,000	31,600,000
	1913	209,262,000	242,418,000	31,160,000

The total live stock on farms in 1913 was as follows: 2,866,008 horses (2,132,489 in 1909), 2,740,434 milch cows (2,849,305), 3,915,687 other cattle (4,384,779), 2,128,531 sheep (2,705,390), 3,448,326 swine (2,912,509).

DAIRYING. Large quantities of dairy produce are exported. The total butter production in 1910 was 202,796,699 pounds (valued at \$45,926,553), as compared with 141,409,815 pounds in 1900. The increase in quantity is 43.41 per cent. The total cheese production in 1910 was 201,267,466 pounds, valued at \$15,798,881. The total quantity of milk produced was returned by farmers as 9,871,178,103 pounds. There were, in 1910, 3625 butter and cheese factories; output of cheese, 199,904,205, valued at \$21,587,124; butter, 64,698,165 pounds, \$15,645,845.

Home-made butter, 138,098,534 pounds, valued at \$30,280,608; cheese, 1,363,261 pounds, \$153,036. The condensed milk factories had an output valued in 1910 at \$1,814,871.

FORESTS. The total area covered by timber is estimated by the forestry branch of the Department of the Interior at between five and six hundred million acres, of which between two and three hundred million acres are covered by timber of commercial size. The total forest reserve has grown from 7,413,760 acres in 1901 to 152,833,955 acres in 1914, distributed as follows: 107,997,513 acres in Quebec, 14,430,720 in Ontario, 2,474,240 in British Columbia under provincial control; and 27,931,482 acres of land under federal jurisdiction in Manitoba (2,606,400 acres), Saskatchewan (6,195,706), Alberta (16,711,776), and British Columbia (2,417,600). The present administration of the forest reserve provides little beyond a service, by appointment of forest rangers, for the prevention and control of forest fires, the enforcement of fire-prevention regulations, and the provision of fire-fighting appliances; but measures for more scientific and remunerative management are in process of development.

FISH AND GAME. The estimated total capital invested in the fisheries amounted in 1912-13 to \$24,388,459 (\$20,932,004 in 1911-12), of which \$20,442,714 was invested in connection with the sea fisheries, and \$3,945,745 with the inland fisheries. Value of vessels and boats in 1912-13 engaged in fishing, \$7,744,038; value of fishing gear, canneries, fish-houses, and other fixtures, \$16,644,421. Persons engaged in the fishing industry, 88,408, of whom 23,237 were employed on shore in canneries, etc. Total value in 1912-13 of all kinds of fish, fish products, and marine animals taken in both sea and inland fisheries, \$33,389,464, a decrease of \$1,278,408 as compared with 1911-12 (\$34,667,872). Of the total amount in 1912-13, the products of the sea fisheries were valued at \$29,315,772, of the inland fisheries at \$4,073,692. The value of the total fisheries products in 1912-13 by provinces was as follows: British Columbia, \$14,455,488 (\$13,677,125 in 1911-12); Nova Scotia, \$7,384,055 (\$9,367,550 in 1911-12); New Brunswick, \$4,264,054 (\$4,886,157); Ontario, \$2,842,878 (\$2,205,436); Quebec, \$1,988,241 (\$1,868,136); Prince Edward Island, \$1,379,905 (\$1,196,396); Manitoba, \$800,149 (\$1,113,486); Saskatchewan, \$111,839 (\$139,436); Alberta, \$51,616 (\$102,325); Yukon, \$111,239 (\$111,825).

The value of the skins and furs of wild animals killed during the year 1910 was \$1,927,550 (\$899,645 in 1901); of which \$445,320 was for assorted furs, \$256,213 for muskrats, \$221,583 for martens, and \$221,500 for minks.

HOMESTEADS. Ordinary homestead entries for lands of the Dominion government during the calendar year 1913 totaled 31,499 (35,538 in 1912). Of this number 2998 entries were made in Manitoba, 14,524 in Saskatchewan, 12,122 in Alberta, and 1855 in British Columbia. Pre-emptions under the Dominion Lands Act in 1913 numbered 6483-4711 in Saskatchewan and 1772 in Alberta. Purchased homesteads, 783-534 in Saskatchewan and 252 in Alberta.

MINING. The total value of the mineral products in the calendar year 1913 was \$144,031,047 (preliminary report of the Department of Mines), as compared with the final revised total of \$135,048,206 for 1912. This is an increase

of 6.65 per cent. Labor strikes in Vancouver Island affected the coal output. The total output of metals was valued at \$66,127,821, or 45.9 per cent of the total value, and of nonmetallic products at \$77,903,226, or 54.1 per cent. In the table below is shown the value of the mineral output by provinces for two years, with percentage of totals:

	1912		1913	
	\$	P.c.	\$	P.c.
Ontario ..	51,985,876	88.50	58,697,602	40.75
Br. Columbia	30,076,685	22.27	28,529,081	19.81
Nova Scotia	18,922,236	14.01	19,305,545	18.40
Alberta ..	12,073,589	8.94	13,844,622	9.61

Stone			4,726,171	
Miscellaneous			8,973,828	
Total non-metals		78,875,548		77,903,226
Grand Total		139,048,296		144,081,047

* Quantities as follows: 'a' = lbs.; 'b' = oz.; 'c' = tons; 'd' = m. feet; 'e' = barrels; 'f' = bushels.

The pig iron quoted above is derived from Canadian ore. In addition, pig iron was produced from imported ores as follows: 978,232 tons valued at \$14,100,113 in 1912, and 1,055,459 tons valued at \$15,543,583 in 1913.

MANUFACTURES. A comparison of the returns of the manufacturing industries for 1905 and 1910 showed increase of capital in 5 years of 47.36 per cent, of employees on salaries 20.77, of salaries 42.49, of employees on wages 32.32, of wages 46.77, and of products 62.31. The returns for the 5 years from 1900 to 1905 showed increase of capital of 89.43, of employees on salaries 18.91 per cent, of salaries 29.77, of employees on wages 15.41, of wages 50.02, and of products 49.32. The number of establishments in 1910 was 19,218; capital invested, \$1,247,583,609; employees on salaries, 44,077; salaries, \$43,779,715; employees on wages, 471,126; wages, \$197,228,701; value of raw and partly manufactured materials, \$601,509,018; value of output, \$1,165,975,639. In the table below are shown number of establishments, amount of invested capital, and value of total production by provinces for the year 1910:

	No.	Capital	Output
P. E. Island	442	2,013,865	3,186,470
Nova Scotia	1,480	79,596,341	52,706,184
New Brunswick ..	1,158	86,125,012	85,422,802
Quebec	6,684	326,946,925	350,901,656
Ontario	8,001	595,894,608	570,810,225
Manitoba	439	47,941,540	58,678,609
Saskatchewan	178	7,019,951	6,832,132
Alberta	290	29,518,846	18,788,825
Br. Columbia ...	651	128,027,521	65,204,236
Canada	19,218	1,247,583,609	1,165,975,639

Engaged in the manufacture of food products were 6885 establishments, with \$133,044,523 capital invested, 52,730 employees on wages, \$175,453,469 cost of raw materials, \$245,669,321 value of output; timber and lumber industries, 4999 establishments, \$259,889,715 capital, 110,059 employees, \$94,052,429 cost of materials, \$184,630,376 value of output; textiles, 1444 establishments, \$108,787,407 capital, 72,672 employees, \$72,128,436 cost of materials, \$135,902,441 value of output; iron and steel works, 824 establishments, \$123,561,319 capital, 48,558 employees, \$52,452,103 cost of materials, \$113,-

640,610 value of output; metals and metal products other than steel, 341 establishments, \$67,133,540 capital, 17,502 employees, \$33,609,447 cost of materials, \$73,241,796 value of output; vehicles for land transportation, 465 establishments, \$49,397,096 capital, 35,778 employees, \$34,520,154 cost of materials, and \$69,712,114 value of output; leather and its finished products, 399 establishments, \$48,788,802 capital, 22,742 employees, \$34,394,189 cost of materials, \$62,850,412 value of products.

COMMERCE. In the table below are shown total imports of merchandise dutiable (D) and free (F), coin and bullion, and total general; imports entered for consumption dutiable and free, coin and bullion, and total special; also exports of Canadian and foreign produce, coin and bullion, and total exports, for three successive years:

	1912	1913	1914
Imports			
Mdse. D	\$343,370,082	\$456,686,187	\$425,324,576

Total exps.	\$315,817,250	\$393,282,057	\$478,997,028

Total duties collected on imports for home consumption, 1911, \$73,312,368; 1912, \$87,576,037; 1913, \$115,063,688; 1914, \$107,180,578. In the table below will be found exports of Canadian produce by great classes for three successive years:

	1912	1913	1914
Mining prods.	41,824,516	57,442,546	59,089,054
Fisheries prods.	16,704,678	16,886,721	20,628,560
Forest prods.	40,892,674	43,255,060	42,792,187
Animal prods.	48,210,654	44,784,593	58,349,119
Agricul't. prods.	107,148,375	150,145,661	198,220,029
Manuf. prods.	85,886,284	48,692,708	57,448,452
Miscellaneous ...	111,676	97,811	121,088
Total exps.	296,228,857	355,754,600	481,588,489

The principal imports for consumption in 1914 were as follows, values in thousands of dollars: Live animals, 2515; books, maps, pamphlets, periodicals, etc., 6754; breadstuffs, 9426; carriages, automobiles, bicycles, etc., 20,098; cement, 352; coal, coke, etc., 49,036; cotton and its manufactures, 37,601; drugs, dyes, chemicals, and medicines, 14,638; earthenware and chinaware, 3,131,305; electrical apparatus, 8924; fancy goods, 4879; fish, 2173; flax, hemp, jute and their manufactures, 8963; fruits, 17,233; furs and their manufactures, 3754; glass and its manufactures, 5075; gutta-percha, India rubber and their manufactures, 8994; hats, caps, bonnets, etc., 5452; leather and its manufactures, 8454; total metals and minerals and their manufactures, 154,283; brass and its manufactures, 4415; copper and its manufactures, 6581; iron and steel and their manufactures, 110,221; tin and its manufactures, 6358; oils, 17,095; paints and colors, 2161; paper and its manufactures, 8043; provisions, 10,813; seeds, 1671; settlers' effects, 14,348; silk and its manufactures, 9689; sugar, molasses, etc., 17,949; tea, 6650; tobacco, 6899; wood and its manufactures, 24,676; wool and its manufactures, 31,438.

The leading exports of Canadian produce are cereals and cereal products. In the table below are shown for three years quantities and values of wheat, wheat flour, oats, and the total of all grains, including other than wheat and oats:

	1912	1913	1914
Wheat, bu.	64,466,286	93,166,009	120,426,579
Wheat, \$	62,590,568	88,808,780	117,719,217
Oats, bu.	8,860,675	10,478,554	84,996,664
Oats, \$	8,819,642	5,067,950	13,879,849
All grains, bu.	76,000,661	110,571,807	168,929,880
All grains, \$	68,427,982	97,941,844	188,129,261
Wheat, fl. bbls.	8,788,886	4,478,043	4,882,183
Wheat, fl. \$	16,084,064	19,970,689	20,581,079

Besides cereals, important domestic exports for the years 1913 and 1914, in thousands of dollars, were as follows: Planks and boards, 20,839 and 19,514; deals, 1387 and 1409; wood blocks for pulp, 6806 and 7389; square timber,

1363 and 536; shingles, 1400 and 1776; silver, 20,202 and 20,972; gold, 11,227 and 13,327; copper, 9912 and 9490; coal, 5555 and 3704; asbestos, 2487 and 2892; dry salted codfish, 4302 and 4565; canned salmon, 3484 and 6631; canned lobsters, 3049 and 2984; hides and skins other than fur, 7276 and 9263; furs, 5166 and 5569; bacon and hams, 5674 and 4033; cheese, 20,697 and 18,869 (the greatest export of cheese was in 1903, \$24,712,943); hay, 3950 and 1786; agricultural implements, 6123 and 7220; wood pulp, 5510 and 6365; fresh apples, 4048 and 3465.

In the table below is shown the principal countries of origin and destination with the total imports and exports in thousands of dollars:

	Imports		Exports	
	1912	1914	1912	1914
United States ..	441,143	410,786	167,110	200,459
United Kingdom ..	188,749	192,071	177,982	222,823
France	15,880	14,277	2,565	8,811
Germany	14,215	14,586	8,402	4,454
Br. W. Indies ..	10,578	11,504	6,287	6,998
Belgium	4,020	4,490	4,809	4,820
Newfoundland ..	2,057	1,841	4,728	4,770
South America ..	10,529	9,020	4,852	4,026

SHIPPING. Shipping entered and cleared, exclusive of the coasting trade, in fiscal years:

	Entered		Cleared	
	Vessels	Tons	Vessels	Tons
	Sea-going			
1904	14,985	8,143,856	15,059	7,682,849
1909	15,140	10,264,187	15,042	9,501,689
1912	18,087	18,575,193	17,579	12,655,905
1914	18,320	14,982,893	17,695	14,586,093
	On Inland Waters			
1904	21,110	8,122,839	20,516	7,352,661
1909	21,774	10,626,876	21,763	10,808,851
1912	30,814	16,147,103	30,754	15,471,582
1914	28,316	16,208,290	29,156	16,144,707

COMMUNICATIONS. The total railway mileage in operation June 30, 1913, was 29,304. In 1880 there were in operation 7194 miles; in 1890, 13,151; in 1900, 17,657; in 1910, 24,731; in 1912, 26,727. For the fiscal years 1912 and 1913, respectively, the gross earnings were \$219,403,753 and \$256,702,703 (from freight, \$149,961,140 and \$177,089,373; from passenger traffic, \$65,048,187 and \$74,431,994); operating expenses, \$150,726,540 and \$182,011,690; net earnings, \$68,677,213 and \$74,691,013; freight carried, 89,444,331 and 106,992,710 tons; passengers carried, 41,124,181 and 46,230,765.

During the fiscal year 1913, there were added to the capital liability of railways \$100,483,633, including stocks, \$47,882,910, and funded debt, \$52,600,723. These additions would have brought the capital liability to \$1,689,421,159; but during the year 1912-13 a reconstruction of the capital statement of railways was completed with the result that from stocks were eliminated \$63,025,745 and from funded debt \$94,564,722, while a sum of \$163,257,224 was placed in a new class as consolidated debenture stock. Thus the revised total of the capital liability June 30, 1913, stood at \$1,531,830,692.

The increase in Canadian railway mileage for the fiscal year 1913 was 2577, as compared with 1327 in 1912, 699 in 1911, and 627 in 1910. Part of the increment for 1913 is accounted for by the bringing into the report of 1396 miles of the Grand Trunk Pacific Railway, which

hitherto, although in operation, were officially regarded as under construction.

On June 30, 1913, the Canadian Pacific Railway had a mileage leased and owned of 11,508, as well as 970 miles of double track; the Grand Trunk Railway, 5049 miles, with 707 miles of double track. On the eastern division of the National Transcontinental Railway, under construction by the Dominion government from Moncton, N. B., to Winnipeg, Man., a distance of 1805 miles, 90 miles of main-line track were laid during the season ended Nov. 30, 1913, and the total mileage of main-line track laid to this date was 1822, including double track. The western section of the National Transcontinental, from Winnipeg to Prince Rupert, B. C., is under construction by the Grand Trunk Pacific Railway Company. The track was connected on the last section between East and West at mile 1371 west of Winnipeg on April 7, 1914, so that construction trains were enabled to pass over the entire line from Winnipeg to Prince Rupert. In the summer of 1914, regular train service was in operation between Winnipeg and Prince George, B. C., a distance of 1279 miles, and also between Prince Rupert and Priestly, B. C., 337 miles.

In September the Grand Trunk Pacific announced through passenger and freight service between Fort William and Prince Rupert, placing the latter city in direct communication with eastern Canada and the United States, and affording access to a large number of towns in central British Columbia, which hitherto had been reached only by stage or river steamers. The Grand Trunk Pacific had 2195 miles of main line in operation. During 1913, 1227 miles of new road were added to the Canadian Northern Railway. Progress on the Canadian Northern Pacific Railroad in British Columbia continued actively during the year, so that at its close it was anticipated that the last spike would be driven some time in 1915. Nearly all of the important bridges had been completed on October 1, but there remained a few canyons still to be crossed and some gradings in the gap. The tracklaying gangs working east from Vancouver had advanced from a point 123 miles north of the Kamloops on October 1, while the westbound gangs had carried the rail-head 48 miles west of Yellowhead Pass, so that an 86-mile gap remained to be completed on October 1. The main line within the borders of British Columbia had a total of about 50 bridges and trestles, ten of which were structures of considerable importance, while nine were viaducts or shorter span steel bridges. The mileage operated by the Intercolonial Railways is 1489. On the new line from Le Pas, Man., to Hudson Bay, under construction by the Dominion government, 82 miles of track were laid by the end of 1913, and 130 miles were graded for tracklaying. During the year 1914 there were 1978 miles of first track and 152 miles of second track completed in the Dominion of Canada, as compared with 3013 miles of new first track and 363 miles of second track in 1913. Of this amount of new construction in 1914 the Canadian Pacific built 820 miles of new line, and the Canadian Northern and its subsidiaries built 515 miles, while the Grand Trunk Pacific built 249 miles. Nearly all of this new mileage was in Western Canada, and the construction of second track was confined entirely to the Canadian Pa-

cific. At the end of 1914, 465 miles of new first track was under construction in Canada; also 2127 miles additional was surveyed, and 80 miles projected.

On October 25 it was announced by the Attorney-General of British Columbia that through the efforts of the Federal government \$6,000,000 would be loaned to the Pacific Great Eastern Railway on the security of its bonds. This amount was to aid in tiding over the financial crisis, and to provide for the continuation of construction work, which at that time was being participated in by some 6000 men on the company's payroll in British Columbia. With this loan the construction was not only continued but was carried on so strenuously that records for rapid progress were made. The completed line had been ballasted from tidewater at Squamish to Pemberton Meadows on the Lillooet River, a distance of about 75 miles, and it was proposed at once to establish a combination freight and passenger service to accommodate settlers. See below paragraphs on *History*.

The following table shows the mileage of Canadian railways by provinces, at the end of fiscal years:

	1908	1911	1913	1913
Ontario	7,928	8,322	8,546	9,000
Quebec	3,574	3,882	3,882	2,988
Manitoba	8,111	8,466	8,520	8,993
Saskatchewan	2,081	3,121	3,754	4,651
Alberta	1,323	1,494	1,897	2,212
Br. Columbia	1,738	1,842	1,855	1,951
New Brunswick	1,509	1,548	1,545	1,545
Nova Scotia	1,844	1,854	1,857	1,860
Prince Edward Island..	267	269	269	279
Yukon	91	102	102	102
In United States	225
Total	22,966	25,400	26,727	29,304

The telegraph systems include lines owned and operated by the Dominion government and lines owned and operated by railway and telegraph chartered companies. The government service, March 31, 1913, had 9729 miles of lines (including 277 knots, reckoned as miles, of submarine cables); offices, 682. The ten companies reporting in 1913 had 36,604 miles of lines, with 176,124 miles of wire, and 3331 offices. There are many coastal radiotelegraphic stations. In 1913, there were 463,671 telephones in use, with 1,092,587 miles of wire. Post offices in 1900, 9627; in 1912, 13,859; in 1913, 14,178.

FINANCE. The system of public finance includes a consolidated fund and miscellaneous accounts. To the consolidated fund are paid in the revenues and out of it are paid the expenditures properly relating to the fiscal year. The miscellaneous accounts comprehend loans, debt redemption, railway administration, capital expenditure on public works, etc. For fiscal years ended March 31 (except 1903, which ended June 30), the expenditure and the revenue of the Dominion government are shown below, in dollars. The several items are indicated as follows: *a* expenditure chargeable to consolidated fund; *b* expenditure chargeable to capital; *c* railway subsidies; *d* other charges; *e* total disbursements; *f* revenue on account of consolidated fund; *g* other revenues; *h* total revenue; *i* difference between receipts and disbursements; *j* sinking funds; *k* net difference between receipts and disbursements, that is, net excess of receipts (except in 1909, when there was a net excess of expenditure).

	1908	1909	1913	1913
a	\$51,691,908	\$84,064,232	\$98,161,441	\$112,059,587
b	7,052,725	42,593,167	80,989,576	27,206,046
c	1,468,222	1,785,887	859,400	4,985,507
d	1,588,722	4,998,238	7,181,665	255,788
e	61,746,572	133,441,524	137,142,082	144,456,878
f	66,037,069	85,093,404	136,108,217	168,689,908
g	3,311,015	456,176	524
h	69,348,084	85,549,580	136,108,217	168,690,427
i	7,601,512	47,901,944	1,083,865	24,288,649
j	2,620,588	1,922,525	1,156,456	1,884,285
k	*10,222,100	†45,979,419	*122,591	*25,617,984

* Net excess of receipts. † Net excess of expenditure.

Ordinary revenue and expenditure, that is, receipts and disbursements on account of consolidated fund, have been as follows for fiscal years:

Receipts			
	1912	1913	1914
Customs	\$ 85,051,872	\$111,764,699	\$104,691,238
Excise	19,261,662	21,447,445	21,452,087
Post office	10,492,894	12,051,729	12,954,580
Railways	11,034,166	12,442,208	18,894,817
Miscellaneous	10,268,123
Total	\$136,108,217	\$168,689,908	\$163,174,895
Disbursements			
	1912	1913	1914
Debt charges	\$12,706,850	\$ 18,089,405	\$ 13,353,519
Sinking funds	1,156,456	1,884,285	1,371,429
Provincial subsidies	10,281,045	13,211,800	11,280,469
Civil govt.	4,774,678	5,109,459	5,607,795
Public works	10,344,487	13,468,505	19,007,518
Defense	7,580,600	9,114,538	11,151,399
Revenue collection	28,256,780	33,006,201
Other	28,060,541	28,675,259
Total	\$98,161,441	\$112,059,587	\$127,384,478
Surplus	37,946,777	56,630,366	35,789,922

The following figures relate to March 31, 1913 and 1914: Total debt, \$483,232,555 and \$544,391,369; total assets, \$168,930,930 and \$208,394,519; net debt, \$314,301,626 and \$335,996,850. The net debt increased from \$152,451,589 in 1880 to \$237,533,212 in 1890, \$265,493,807 in 1900, \$336,268,546 in 1910. Interest paid on debt in the fiscal year 1914, \$12,893,505; interest received from investment, \$1,964,541.

NAVY. The Naval Service Department was established in 1910. A programme of construction was introduced, but subsequently abandoned. Another programme was introduced in December, 1912, in a bill appropriating \$35,000,000, but in 1913 the bill failed of enactment. The only ships of fighting value are the first-class cruiser *Niobe* (11,000 tons) and the second-class cruiser *Rainbow* (3000 tons). There are 24 small vessels, 8 of which are for fishing protection duty, 3 are used on the Great Lakes, 2 are ice-breakers, 4 are detailed for lighthouse duty, and the remainder are used in the revenue and surveying services. See below, under *History*.

ARMY. While every citizen of Canada between the ages of 18 and 60 is liable for service in the militia under the Canadian Militia Act of 1904, yet compulsory service up to 1914 was unnecessary, and cadet and volunteer training sufficed. There was a small permanent force, about 3500, largely for purposes of instruction, and a volunteer force of about 75,000, with annual periods of training. On the outbreak of

the war a large number of volunteer organizations were mobilized in various camps of instruction, new recruits were enlisted, and early in the autumn the regiments, convoyed by battleships, were transported to England. Naturally the greatest secrecy attended these operations and few details were forthcoming during the year. See below, under *History*.

GOVERNMENT. The executive authority is exercised in the name of the King of Great Britain and Ireland by an appointed governor-general acting through a privy council, or responsible ministry. The legislative power is vested in a parliament of two houses, the Senate and the House of Commons. The Senate consists of 87 members, nominated for life by the governor-general. Members of the House of Commons—221 in number—are elected by popular vote and hold office for 5 years unless the Parliament is sooner dissolved. The governor-general in 1914 was Prince Arthur, Duke of Connaught and Strathearn (brother of Edward VII), who assumed office Oct. 31, 1911. On Oct. 10, 1911, the Liberal ministry of Sir Wilfrid Laurier was succeeded by a Conservative ministry under the premiership of R. L. Borden. It was composed in 1914 as follows: Premier, Sir Robert Laird Borden; minister of trade and commerce, Sir George Eulas Foster; interior, Dr. William James Roche (from Oct. 29, 1912); public works, Robert Rogers (from Oct. 29, 1912); railways and canals, Francis Cochrane; finance, William Thomas White; postmaster-general, Louis Philippe Pelletier; minister of marine and fisheries, John Douglas Hazen (also minister of the naval service); justice, Charles Joseph Doherty; militia and defense, Samuel Hughes; secretary of state, Louis Coderre (from Oct. 29, 1912, also minister of mines from Feb. 10, 1913); minister of labor, Thomas Wilson Crothers; inland revenue, Wilfrid Bruno Nantel; customs, John Dowsley Reid; agriculture, Martin Burrell; ministers without portfolio, George Halsey Perley, Albert Edward Kemp, and James Alexander Lougheed; solicitor-general (not in the cabinet), Arthur Meighen (from June 26, 1913).

Each of the provinces has an elected legislature, an executive (lieutenant-governor) appointed by the governor-general and acting through a responsible ministry.

HISTORY

THE GOVERNOR-GENERAL. Early in May, 1914, it was announced that Prince Alexander of Teck, Queen Mary's younger brother, would succeed in October to the post of governor-general and commander-in-chief of the Dominion of Canada, upon the expiration of the three-year term of Prince Arthur, Duke of Connaught and Strathearn, who assumed office Oct. 10, 1911. In America, as well as in the far distant Australasian colonies of the British Crown, this appointment of a second prince of the royal family as Canadian governor-general gave rise to the query whether the office was to be filled henceforth solely by persons of royal birth, and elevated to the dignity of what might be styled a secondary British throne. In Canada the appointment was interpreted as a high compliment, and the *Montreal Star* printed the forecast—which sounds somewhat oddly to citizens of a republic—"it goes without saying that he (Prince Alexander) will continue the demo-

cratic tradition at Rideau Hall." Prince Alexander, however, had no opportunity to continue or to abandon the democratic tradition at Rideau Hall; for when the month of October arrived, Canada, along with the whole empire, was engaged in a titanic war, and on account of the war the Duke of Connaught was retained in office.

NAVAL POLICY. The outstanding feature of Canadian politics in 1913 had been the wordy battle waged over the government's proposal to contribute \$35,000,000—the cost of three super-dreadnoughts—to the Imperial navy. A hostile Liberal majority in the Senate of the Dominion Parliament had defeated the project, but only temporarily; and it was generally conceded that the whole tenor of Canadian naval policy remained wavering in the balances of party-politics. While public opinion continued to be agitated on the subject, the premier seemed content to bide his time. During the course of the debate in January on the Address in Reply to the Speech from the Throne, he intimated that the naval question would not be reopened until the government had gained a majority in the Senate, and it would be possible to atone for the Senate's regrettable decision of last year. "So far as the permanent policy of naval defense is concerned, I gave a pledge to the people previous to the last general election that it should be submitted to them at a general election before it should be undertaken. That pledge still holds good." His quiet confidence was only strengthened by an incident in March which caused no little confusion in the ranks of the Liberal Opposition. On March 17 Mr. Churchill in a speech that has already become famous, alluded to the failure of Canada to participate in the work of imperial naval defense. Immediately the *Montreal Star* came out with the sensational headline, "Canada's Shame," bitterly lamenting that Canada's delinquency had given the First Lord of the Admiralty occasion to administer such a public rebuke, and concluding: "The whole blame for this biting national humiliation . . . rests upon the Liberal majority in the Canadian Senate, which killed the only naval bill that could possibly have passed last session." The Liberal party was thus on the one hand subjected to the most violent reproaches, while on the other hand it found itself obliged to defend Sir Wilfrid Laurier's pet policy of creating local colonial fleet units against the new policy enunciated by the British Admiralty of concentrating colonial as well as imperial first-class warships where they would do the most good—in European waters watching the dangerous German navy. Rather than alter its own policy, the Liberal press of Canada now accused Mr. Churchill of inconsistency and vacillation.

REFORMING PARLIAMENT. Under normal conditions, Sir Robert Borden could not hope to build up a ministerial majority in the Senate except by waiting for Liberal Senators to die off, one by one, and appointing Conservatives to fill their places. During the months of March, April, and May, he gained four seats in the Senate by the deaths of three (including Sir George Ross, the Liberal leader in the Senate) and the withdrawal of one Liberal Senator. But this process was too slow. When Parliament was opened in January, 1914, Sir Robert Borden explained his plan for the creation of 9 new sena-

torial seats, which would be distributed, 2 to Manitoba, 2 to Saskatchewan, 2 to Alberta, and 3 to British Columbia, so that these four western provinces would have six senators apiece, as their recent growth well warranted. Incidentally, the nine new seats might be filled with Conservatives. Parliament was therefore asked to consent to an amendment of the British North America Act, and one of the ministers was sent to London to take up the question with the Imperial government. Meanwhile the most diverse opinions were ventilated as to the proper place, constitution, and authority of the Senate, and the possibility of abolishing the upper chamber.

The government proposed also to redistribute the representation in the lower house of the Dominion Parliament. Important movements of population since the last redistribution (in 1903) made it necessary to increase the membership of the House from 221 to 234, the representation of Quebec remaining fixed at 65 members as the standard for determining the unit of representation. A summary of the changes is subjoined:

	Before	After
Alberta	7	Increased by 5 12
British Columbia	7	Increased by 6 13
Manitoba	10	Increased by 5 15
New Brunswick	13	Decreased by 2 11
Nova Scotia	18	Decreased by 2 16
Ontario	86	Decreased by 4 82
Prince Edward Island	4	Decreased by 1 3
Quebec	65	65
Saskatchewan	10	Increased by 6 16
Yukon Territory	1	1
Total	221	Increased by 13 234

It will be readily observed that whereas the eastern provinces stood to lose 9 seats, the western provinces might rejoice in a gain of 22. No one disputed the growth of the West, or its importance in wealth and population, which had increased by leaps and bounds; but the citizens of the eastern provinces, as represented by Mr. Mathieson (premier of Prince Edward Island), Mr. Flemming (premier of New Brunswick), and Mr. Murray (premier of Nova Scotia), did protest, and that most earnestly, against the diminution of their own representation. Mr. Mathieson even produced original documents to prove that by the terms of the union Prince Edward Island was always to have at least six members in the Dominion House of Commons.

THE TARIFF AND THE BUDGET. While naval policy and parliamentary reform occupied the centre of the stage, a less conspicuous place was found for the perennially interesting subject of the tariff. In January the Manitoba Legislature unanimously adopted a resolution asking the Dominion government to remove the countervailing duty on wheat, thus opening the market of the United States to West-Canadian farmers. Also in the Dominion Parliament a demand was raised for the removal of food-duties; but Mr. White, the minister of finance, declared that abolishing the food-duties would not reduce the cost of living, but would simply add to the present troubles by throwing over fifty thousand men out of work. Consequently it was not much of a surprise when the draft budget for 1914–15, presented April 6, entirely omitted any downward revision of the tariff. Sir Wilfrid Laurier in vain offered an amend-

ment: "that wheat and wheat products and agricultural implements be placed on the free list, and that steps be taken to alleviate the high cost of living by a considerate removal of taxation"; but his amendment was straightway defeated by a clean party vote of 88 to 46. In explaining the budget, Mr. White remarked that although the past fiscal year (1913-14) had been characterized by a severe financial stringency and a falling-off of \$5,000,000 in the Dominion revenues, he hoped that for 1914-15 there would be a surplus of \$36,500,000 over the ordinary expenditures; but this surplus would all be consumed in special expenditures, and the government would increase its debt by \$19,000,000, which amount was to be advanced to aid various railways.

GOVERNMENT AID FOR RAILWAYS. In order to insure the rapid development of her enormous uncultivated areas, Canada has had to grant lavish aids and subsidies to the private corporations which have undertaken to build her railways. The administration of such sums has, however, not always been above suspicion of blame; for example, a commission appointed to investigate the cost of the National Transcontinental portion of the Grand Trunk Pacific Railway reported a wastage of \$40,000,000. Nevertheless, short of government ownership, there was no alternative to subsidizing private enterprise, however wasteful or untrustworthy. When, therefore, the Canadian Northern Railway appealed to the government for a loan of \$20,000,000 or more, it was expected that some assistance would be granted, for the sake of enabling the company to complete its construction work, although a different form of assistance might be chosen. Finally the government decided to guarantee a bond issue for the railway to the amount of \$45,000,000, and at the same time to insist upon the reorganization of the company. The capitalization of the Canadian Northern and subsidiary companies, amounting to \$145,000,000, was reduced to \$100,000,000 in a new merged company, of which the government received stock to the par value of \$40,000,000, including the \$7,000,000 stock transferred to the government last year when a subsidy was granted to the railway. Sir W. Mackenzie and Sir Donald Mann owned the remaining \$60,000,000 of the capital stock. As safeguards in consideration of the bond guaranty, the government required (1) that the proceeds of the bond issue should be used solely for the completion of the Transcontinental system, and (2) that should the company at any time fail to meet its obligations, the government might summarily dismiss the present directors, or might vest the enterprise in a new corporation, or might take over the road directly in trust for the people. These proposals, endorsed by the Conservative and condemned by the Liberal caucus, were vigorously opposed in the House of Commons by Sir Wilfrid Laurier, who declared that public funds to the amount of \$280,209,705 had already been advanced to the Canadian Northern, and asserted that if the government invested so much of the people's money in the enterprise, the government ought not to be in the position of a mere minority stockholder, with Sir William Mackenzie and Sir Donald Mann reaping all the profits, but should assume a controlling interest in the Transcontinental system. After an acrimonious discussion, in the course of which

the demand was made for a Parliamentary investigation of the Canadian Northern, on May 28 a series of resolutions were passed approving the government's scheme, and a bill embodying the same was finally approved by the Senate June 9; whereupon the arrangement was effected with the Canadian Northern, July 16. Another railway enterprise was much discussed in 1914, for the construction of a railway 1500 miles long in the region of the Canadian Rocky Mountain coal deposits; the backers of the scheme, among whom D. A. Thomas (of Cardiff, Wales,) was chief, applied for a charter under the corporate name of the "Pacific Peace River and Athabasca Co." An even grander project—to connect Georgian Bay with the St. Lawrence by canal—was referred to a commission. It is also worth noting that the government received a petition begging it to establish a transatlantic steamship line in order to counteract the exactions of the North Atlantic shipping combine.

SUNDAY ITEMS. The government brought in a bill on February 17 to regulate the incorporation of trust companies and to require the auditing of accounts of such companies, and the furnishing of detailed returns to the Finance Department showing all investments. A parcels post was inaugurated February 9, with rates considerably lower than the existing express rates; in consideration of the increased volume of postal business, the railways received an increased subsidy of about \$3,000,000 in place of \$2,000,000 a year. With regard to public lands a new arrangement was proposed in January, 1914, by the premiers of Manitoba, Saskatchewan, and Alberta, in a joint letter to Sir Robert Borden; the three provincial premiers proposed that the Dominion government should surrender to the provinces its control over public lands, timber, coal, and other natural resources, and at the same time continue to pay the cash subsidies which were originally granted to the provinces in lieu of their natural resources. The question was debated in the Dominion Parliament during February, at which time Sir Robert Borden stated that he could not accede to the demand without undertaking a sweeping revision of the whole system of financial relations between the Federal government and the provinces.

The interesting question whether titles of honor, conferred by the Crown, are incompatible with the spirit of democracy, was raised in the House of Commons in February, when Mr. Burnham introduced a bill to abolish all titles in Canada; Sir Wilfrid Laurier agreed in principle and suggested that an Address to the King would be better than a bill; the government, however, defended the bestowal of titles and the bill was defeated. Among trade-unionists a lively interest continued to be shown in the fate of the men who were last year imprisoned for rioting in connection with the Vancouver Island coal strike. As the last NEW INTERNATIONAL YEAR BOOK (page 118) recorded the facts, the strike began on May 1, 1913, and led to disastrous rioting in August, 1913; in 1914 the strike still dragged on. In April it was necessary to send 200 more soldiers to Nanaimo (on Vancouver Island) for the preservation of order while the United Mine Workers of America held a mass meeting on May 1 as a mark of sympathy for the miners who had been out on strike just a year. As far as the men arrested last

year were concerned, 46 who pleaded guilty of unlawful assembly were released on suspended sentence by the Special Assize Court on March 24, 1914; 8 were sentenced to one year; Joe Angelo of the United Mine Workers of America was given four years' penal servitude; and John Place, a Socialist member of the British Columbia Legislature, was convicted of "unlawful assembly," but was released without further imprisonment. On June 19 an explosion in the Hillcrest coal mines (near Fernie, B. C.) killed 189 miners. Little was heard of this disaster, but a wave of horror swept over the land when about a thousand lives were lost in the sinking of the *Empress of Ireland*, May 29, in the St. Lawrence River, after collision with a Norwegian collier. See SAFETY AT SEA.

THE KOMAGATA MARU. One of the most remarkable episodes of the year was the attempt of a shipload of Hindus to secure admission into Canada in spite of the determination of the Canadian government to prevent the influx of Asiatic immigration. As more fully explained in the article on INDIA, the subjects of Great Britain's Indian Empire keenly resented the avowed intent of the British self-governing colonies to debar Indian laborers, and particular irritation was caused by the hypocritical Canadian law which forbade the entry into Canada of Orientals except by direct passage from the land of their birth, thus excluding Indians, because there was no steamship line on which they might pass directly from India to Canada. To fulfill the requirements of this law, Gurdit Singh, a wealthy Hindu contractor, chartered a Japanese steamer, the *Komagata Maru*, upon which he and 379 other Hindus voyaged from Calcutta to Vancouver, not setting foot on land at any intermediate point. When the *Komagata Maru* arrived in May off the coast near Vancouver, she was moored some distance from the shore and no one allowed to land until examined by the immigration authorities. First there was the medical examination, which enabled the authorities to reject 90 of the would-be immigrants; then there was an order in council, recently promulgated, which forbade the entry of artisans, owing to the overcrowded condition of the industrial-labor market; and then there was the question whether the Hindus could not after all be excluded under the "direct passage" rule, since their ship had touched at Hongkong on the way over. It was clear that the authorities would strain these rules to the utmost in order to exclude the Hindus, and the minister of the interior publicly stated that with the exception of 13 who had previously lived in Canada, the Hindu immigrants would be shipped back to Asia, unless the courts should forbid. The attitude of the Hindus, on the other hand, grew steadily more defiant. Gurdit Singh had thrown down the gauntlet: "We are British subjects. Let them keep us out if they dare, and think of the consequences to our British Empire in India." As the days lengthened into weeks, and still admission was denied, the Hindus resorted to a hunger strike, and cabled a message to King George saying that they had been starving and without water for two days and had not been permitted to land to obtain supplies; but the officials affirmed that the *Komagata Maru* was well provisioned. Then, it was said, the Hindus engaged in weird religious ceremonies, dancing on deck and beating their cymbals and

gongs in a frenzy of despair. Meanwhile at Ottawa the Dominion Parliament was passing a Naturalization Bill, designed with a view to securing uniformity within the British Empire; and at Victoria the Court of Appeals was hearing the plea of Munshi Singh, one of the Hindus, who applied for a writ of habeas corpus. The court handed down a decision which extinguished the last hopes of the immigrants; and on July 19 a hundred Vancouver policemen set out to compel the *Komagata Maru* to sail for Hongkong. But the Hindus, now thoroughly enraged, beat off the police and refused to leave. They were not prepared, however, to offer like resistance to the menacing guns of the Canadian cruiser *Rainbow*, which presently appeared on the scene. Cowed in spirit, and totally defeated in their purpose, they at last consented to depart peacefully, provided the government would defray the cost of their return passage and provision. This being done, the *Komagata Maru*, with over 350 Hindus on board, put out to sea July 23 on her return passage to Asia. It was hoped that this closed the incident; but in October news was received that in Canada one of the immigration inspectors, William C. Hopkinson, had been murdered by a Hindu, and that in India the returned passengers of the *Komagata Maru* had engaged in a serious riot.

CANADA'S LOYALTY IN WAR. The fact that a large number of Canadians had long insisted on speaking French instead of the English language, and the growing spirit of independence in the colony, had led many observers to suspect that Canada was but loosely bound to the British Empire. But with the approach of war, in those terrible first four days of August, Canada suddenly became unanimously and enthusiastically loyal. Everywhere was manifested the same air of calm conviction that in the forthcoming struggle, if struggle there was to be, Canada would zealously take her part in the defense of the Empire. On July 31 Mr. Hughes, minister of war, had declared that in event of Great Britain's declaring war, Canada could have 20,000 soldiers on transport ships within a fortnight. On August 1, the governor-general informed the British government that "if unhappily war should ensue, the Canadian people will be united in a common resolve to put forth every effort and make every sacrifice necessary to ensure the integrity and maintain the honor of our Empire." On August 3 the *Canada Gazette* published an Imperial proclamation calling out the Royal Naval Reserves; and when war was declared on the night of August 4-5, crowds in the streets and theatres sang the national anthem and cheered the name of the king.

Three hours after the declaration of war, the Canadian government issued a call for Parliament to meet on August 18; in opening the special session the Duke of Connaught proudly boasted "the spirit which animates Canada inspires His Majesty's dominions throughout the world, and we may be assured that united action to repel the common danger will not fail to strengthen the ties that bind together these vast dominions." Instead of offering his usual carping comment, Sir Wilfrid Laurier promised the whole-hearted support of the Opposition in this great fight "for freedom against oppression, for democracy against autocracy, for civilization against reversion to that barbarism in which the supreme law, the only law, is the law of

might." It took the Parliament only five days to pass the necessary eight war bills, and to appropriate \$50,000,000 for war expenditures. This sum was to be raised by increasing the customs and excise duties on sugar, spirits, coffee, and tobacco.

Meanwhile patriotic enthusiasm was rampant throughout the length and breadth of the land. Manitoba was offering to create a battalion of infantry; Hamilton Gault of Montreal was equipping a special regiment, the "Princess Patricia's Light Infantry," at a cost of \$100,000; the Dominion government was donating 1,000,000 bags of flour to Great Britain; the Hindus of Vancouver were offering to equip 500 Hindu soldiers who had seen service in India; Mr. J. K. Ross generously gave \$500,000 to the finance minister, out of a fortune made in Canadian coal and iron; the province of Quebec proffered 4,000,000 pounds of cheese; Nova Scotia promised 100,000 tons of coal; J. C. Eaton of Toronto gave \$100,000 for a battery of quick-firers and offered his yacht *Florence*, the fastest on the Great Lakes, as well as his wireless station at Toronto, the most powerful north of Long Island, for the use of the government; Prince Edward Island came forward with 100,000 bushels of oats, British Columbia with 25,000 cases of tinned salmon, Manitoba with 50,000 bags of flour, Ontario with 250,000 bags of flour, Saskatchewan with 1500 horses; Sir Thomas Shaughnessy donated a hospital ship to be equipped by the women of Canada; the Bank of Montreal contributed \$100,000 and the Canadian Pacific a like amount; and a Patriotic Fund was started by popular subscription, which by October 12 exceeded \$5,000,000.

Gratifying as were such manifestations of loyalty, they would not fight the Empire's battles. Now the Canadians sighed for warships to offer; fortunately Canada was able to purchase two powerful submarines, just completed for Chile, and to place them at the Admiralty's disposal, together with the Canadian cruisers *Niobe* and *Rainbow*. And as for soldiers, Canada immediately offered to send an expeditionary force of 20,000 or more, and issued a call for volunteers. So generous was the response, that within three weeks there were 32,000 men in the Canadian training camp at Valcartier, preparing for active service, and almost 10,000 others under arms; while 150,000 had volunteered their services and were waiting only to be called. Consequently Colonel Hughes, minister of defense, was able to announce that the Canadian expeditionary force would be increased to 31,200 men and 7500 horses. The expeditionary force of over 30,000 was dispatched, and Canadian soldiers were sent to garrison Bermuda and Newfoundland, and still there were—as was announced on October 12—some 200,000 men drilling in Canada. On October 18, Sir Robert Borden declared that Canada would keep 30,000 volunteers continually in active training, to be drawn upon in units of 10,000 at regular intervals during the course of the war. The first Canadian contingent, which was transported by giant liners to gladden the eyes of English folk at Plymouth (where the Canadian expeditionary force arrived on Oct. 14, 1914), and to share in the battle for Britain, was but the beginning.

Not to be overlooked was the effect of the

war in welding together the French and the English factions in Canada. The friction between French Canadians and English Canadians had been especially irritating before the outbreak of the war. In Ontario, for example, the question of teaching French in schools in French districts was so warmly agitated that an Irish professor was removed by the French-Canadian authorities of Ottawa University and the English-speaking students went on strike in April. Similarly in Montreal old jealousies were revived by the election of a French-speaking mayor for the term which had customarily been given to one of English extraction. Where the English-speaking population prevailed, the French had for long years been subjected to slights, it was argued, and therefore in places where the French element was in a majority the English could hardly complain if their privileges were curtailed. Again in Winnipeg the issue was raised, this time on religious rather than linguistic grounds, when in April a big Catholic banquet refused to give the King precedence over the Pope on the list of toasts. Several prominent persons placed a political interpretation upon this incident and accused the Catholics—who were largely French Canadians—of being disloyal to the King; but this quite unjustifiable accusation was strenuously repudiated by the Catholics, who demonstrated their unimpeachable patriotism by singing the National Anthem at their banquet before honoring the toast of "the Pope." Bishop Fallon of London, who was the principal speaker, even carried the war into the enemy's camp by saying, "It is late in the day to teach us a lesson in loyalty, with Sir Edward Carson drilling to drive the Empire to irremediable ruin." But all these petty quarrels and misunderstandings vanished in a moment when war was declared, and while Frenchmen and Englishmen fought side by side in the Old World, French and English Canadians in the New World were drawn together in a new bond of union. To the 2400 French-Canadians who joined the first contingent Colonel Hughes paid unreserved tribute of praise; in addition, with the warm approbation of Sir Robert Borden, the French Canadians of Quebec and Ontario undertook to raise a special French regiment; and it was suggested that 15 French regiments might eventually be formed. For other items of interest see articles on the separate Provinces of the Dominion.

CANADIAN RAILWAYS. See CANADA.

CANALS. Aside from the Panama Canal which is discussed under its own head some of the more notable work of the year is outlined in the following paragraphs.

CAPE COD CANAL. The Cape Cod Canal, the construction of which had been under way for a number of years, was formally opened on July 29, 1914, and communication established between the waters of Buzzards Bay on the south and those of Cape Cod Bay on the north, shortening the distance between Vineyard Sound and Boston by about 70 miles, and eliminating considerable danger due to hidden reefs and banks along the coast of the cape, and the prevalence of fogs. The canal is a sea-level canal without locks, and practically a straight line with but a single curve. It is lighted by electricity at night, so that a passage can be made at any time either night or day. The

railway and highway bridges, which are modern, are structures mostly of the bascule type, having a width of 150 feet in clear between the piers. For the greater part of its length the canal has a bottom width of 100 feet and a depth of 25 feet at mean low water, and at three points the bottom width is increased to 250 feet so as to make passing points for vessels, while in the approaches a width of 250-350 feet is maintained in the channel which extends to deep water at both ends of the canal, the two approaches having a combined length of about five miles. In addition to the excavation an important engineering feature was the massive breakwater, 3000 feet in length from the shore line, to protect the entrance of the canal from filling in by the action of the waves, in addition to forming a shallow harbor for shipping. The excavation for the most part was done by hydraulic dredges. There were two of these machines, capable of handling 4000 cubic yards per day, and the most difficult part of the work, which aggregated the handling of 20,000,000 cubic yards, was to remove a deposit of bowlders, some of which were of large size. These were excavated by a type of steam shovel. In addition to its commercial features the Cape Cod Canal forms a link in the scheme of water commerce along the Atlantic Coast and thus possesses some strategic and military value. The water traffic from the south to New England amounts annually to \$25,000,000, a large part of which is coal, and the increased safety and shortening of the trip around the cape were expected to prove important commercial factors for New England. The tolls for passage through the canal as set at the time of opening ranged from \$3 for motor boats and other small craft to \$70 for freight vessels of from 950 to 999 tons. Those over 1000 gross tons were to pay 10 cents per gross ton for each passage.

At the time of opening, the Cape Cod Canal as finished was fully 25 feet deep at low water, except for about one mile in its central portion, where dams separating the two parts had been placed, there being at this time only about 18 feet depth at this portion. During the remainder of the year this central section was being removed and the canal generally put in order for deep draft ships in the spring of 1915. The work of improvement undertaken during the closing months of the year included the lighting of the channel with electric lamps for a 500-foot distance, the placing of piles at either end and near the approaches, where vessels might moor, and other work necessary to the passage of large steamers and deep draft barges in the summer of 1915. The United States government was engaged in installing buoys in the Buzzards Bay approach and constructing a lighthouse on the end of the breakwater in Cape Cod Bay. From the time of opening to the end of the year yachts, fishing schooners, and other small craft to the number of 600 passed through the new channel and the number was increasing daily. In bad weather, which occurred off Cape Cod during December, the canal was eagerly availed of by such craft.

Towards the end of the year lower tolls through the Cape Cod Canal were made effective to meet the needs of crude material carriers engaged in traffic to and from New Eng-

land. Vessels carrying loads through the canal were thus entitled to use the canal free when returning empty.

NEW YORK BARGE CANAL. During the year the engineers of the western division of the New York State Barge Canal prepared plans for the construction of a section of the canal under six railroad crossings at Rochester and six west of that city. This work had been postponed on account of litigation as to the right of the State to exercise eminent domain in the case of the land occupied by the railroads. It was decided that the State had this right, but it must build and maintain approaches necessary for crossing the railroads. By the end of September it was stated that about 70 per cent of the work on the canal between Buffalo and Albany had been turned over by the contractors to the State.

The total length of waterway involved in the improvement of the various systems, embraced in the New York Barge Canal, including the lakes forming a part thereof, was approximately 530 miles, 435 of which were embraced in the improvement of the Erie, Oswego and Champlain canals, and 95 of which were embraced in the Cayuga and Seneca canal system. Of this total mileage the State Engineer and Surveyor of New York reported that there had been completed to Dec. 1, 1914, approximately 300 miles on the Erie, Oswego and Champlain canals improvement and 70 miles on the Cayuga and Seneca canal improvement, making a total of 370 miles of completed waterway of dimensions sufficient to accommodate Barge canal craft. Or in other words, approximately 70 per cent of the entire length of the contemplated improved canal system had been completed to Barge canal dimensions on that date. Of those portions which had not been completed in their entirety it was conservatively estimated that the work for such sections was at least 80 per cent completed and that the balance of the work necessary to complete such sections should be performed in such time as to permit the entire Barge canal system being utilized sometime during the navigation season of 1916 or by the spring of 1917 at the latest.

The State Engineer and Surveyor of the State of New York reported to the legislature on Dec. 29, 1914, that of the total amount of work contracted for there has been performed work amounting approximately to \$72,700,000 and there was uncompleted on contract approximately \$8,500,000 worth at the end of the fiscal year. On the Cayuga and Seneca Canal at the end of the fiscal year there had been placed under contract work to the amount of \$4,852,735, on which there had been completed \$3,058,572.

At the end of the year all the important structures provided for in the Barge Canal system had been completed with the exception of the guard gate and dam at Rochester, which had been delayed on account of the railroad crossing interference and the delay in providing a scheme of construction in the Genesee River. The completion of the dam at Crescent was to be hastened so that the work would be finished prior to the opening of navigation in the spring of 1915, and make possible the canalization of the Mohawk River from Waterford to Schenectady. By the spring of 1916 it was estimated that the canal from the Hudson

CANAL

LAKE STEAMER "JAMES A. FARRELL" IN NEW CANAL AWAITING THE FIRST DOWN LOCKAGE.

NEW ST. MARYS CANAL AT SAULT STE. MARIE, MICHIGAN

1430

River at Waterford to the city of Oswego on Lake Ontario would be completed to the Barge Canal Terminals, and that portion of the Erie Canal from the junction of the Erie and Oswego Canals at Three River Point as far westerly as the old canal aqueduct in the Montezuma Marshes was nearly completed at the end of the year, as was also the connecting channel from Onondaga Lake to the Seneca River, while in the vicinity of Lyons changes in the plans had somewhat delayed the work.

In regard to providing Barge Canal Terminals as authorized by Chapter 746 of the Laws of 1911, by the end of 1914 contracts had been entered into for the construction of terminal walls, piers, etc., at Erie Basin in Buffalo and Gowanus Bay in New York City, at Oswego, at Thomson and at Troy. Terminal contracts were completed at Fonda, Frankfort, Herkimer, Ilion, Ithaca, Little Falls, Lockport, Whitehall, and Albany, while the construction operations at Schenectady, Amsterdam, Fort Plain, and Plattsburgh were practically completed. Contract plans were prepared for other places and for incidental works involved, while much was done in the way of considering plans for operating machinery and warehouses for the handling and storing of freight.

ST. MARYS FALLS CANAL. On October 21 the Davis lock, the new third lock, and the separate canal on the American side at Sault Ste. Marie were opened to commerce. The new lock is 1350 feet long between gates, affording a usable length of not less than 1300 feet with a width of 80 feet and a least depth of 24½ feet over the sill. The new separate canal had a width of from 260 to 300 feet. The increased depth of the lock made it no longer necessary for the heaviest draft vessels to use the Canadian canal on account of the limited depth of about 18½ feet at low water through the Poe or second American lock. On the first down lockage two steamers carrying 23,000 tons of ore were passed through. The first appropriation for the work was made in 1907 and excavation was in progress since 1909, the masonry being built in 1912 and 1913 and the machinery and gates during 1914. There are two pairs of operating gates in each of the locks so that the total length of the masonry is 1750 feet. The new lock can be filled or emptied in a little more than six minutes, and will accommodate two of the largest lake steamers with one operation. The new canal is crossed by a long Straus bascule bridge, carrying a railway track.

During the season of 1914, which was 214 days, the number of vessel passages through the Sault Ste. Marie canals aggregated 12,639 for the United States canal, and 6078 for the Canadian canal, making a total traffic of 18,717 vessels. The net registered tonnage was 24,690,381 for the United States canal and 17,295,985 for the Canadian canal or a total of 41,986,369. The more important items in the list of articles carried through the canals eastbound were iron ore, 31,410,069 tons, wheat 150,284,095 bushels, and grain 68,338,072 bushels, while westbound 2,240,505 tons of hard coal and 12,246,716 tons of soft coal were the more important articles of commerce.

THE HOHENZOLLERN CANAL. This canal, joining the rivers Oder and Spree, and connecting Berlin, the capital of Germany, by water with

Stettin on the Baltic Sea, 150 miles distant, was opened on June 17 by the German Emperor. The history of this canal dates back to 1669, and its completion marks an epoch in the development of German inland waterways, but it has had other effects in producing cheap transportation in Germany. It makes it possible for vessels of 600 tons and under to go to Berlin from the Baltic, with a saving of more than 50 per cent in freight rates as compared with those of the railways. The canal cost \$12,500,000, and it was estimated that some \$3,000,000 worth of freight would be shipped annually through the new waterway, while there would be a corresponding benefit to the important seaport of Stettin on the Baltic.

KIEL CANAL. During the year the new locks of the Kaiser Wilhelm Canal or Kiel Canal were formally opened on June 24. This canal, which was completed in 1895 after eight years of work, extends from the mouth of the Elbe on the North Sea to Kiel on the Baltic, a distance of about 60 miles. It was constructed to have a normal width of 72 feet at the bottom and 220 feet at water level, with a depth of 29½ feet. This canal is an important element in the German scheme of naval defense, and the reconstruction of the locks and increased depth have resulted largely from military necessity. The locks as first built were 492 feet long, 82 feet wide, and 32 feet deep, being arranged to take care of the large tide variations at the western entrance, and the differences and variation of water level in the Baltic, due to gales. The locks at Kiel remained open most of the time, while those at the Elbe were operated only at certain times. The reconstruction of the canal, begun in 1907, involved its enlargement so that when finished in 1914 it had a width of 335 feet at the surface and 144 feet at the bottom, and a depth of 36 feet, while new locks were built at each end. These new locks have an available length of 1082.6 feet and a width of 147.6 feet, while intermediate gates could be used to have a chamber 328 feet long. These locks are of greater length than those of the Panama Canal. The cost of reconstructing the canal was approximately \$55,000,000.

BALTIC-BLACK SEA CANAL. During the year a favorable report was submitted by the commission appointed by the Russian Duma and Senate in 1910 to consider the proposed Baltic-Black Sea canal scheme. The project involved the canalization of the Dnieper and the Dwina, the former flowing into the Black Sea at Khereson and the latter into the Gulf of Lavonia at Riga. These two rivers are separated by a divide at their sources, and they would be connected here by artificial waterways, so that the total length of canal of 1540 miles would be established.

NORWAY. During the year the scheme for a waterway between Lake Mjösen, Norway and the sea was brought up and a part of the canalization of the Glommen River was proposed. This would involve building several dams on the section from Vamma to Mörkfås, so as to make the Glommen navigable from Oieren to Sarpsborg and on to Fredericksstad. Natural locks would have to be constructed and various schemes of locks and tunnels in order to make a passage from Scarpasfos Falls feasible.

CANAL TOLLS. See PANAMA CANAL TOLLS.

CANARY ISLANDS. A group of islands off the northwest coast of Africa, constituting a province of Spain. Area, 2808 square miles, with a population (1910) of 444,016, of whom 162,601 in Gran Canaria, 45,782 in Palma, 180,327 in Tenerife. The capital is Santa Cruz de Tenerife, with (1910) 63,004 inhabitants; Las Palmas, the most important town, had 62,886. The leading products and exports include potatoes, bananas, onions, tomatoes, and nuts.

CANCER. Abderhalden demonstrated the presence in the blood of animals of certain substances called by him "protective ferments," produced as the result either of experimental stimuli or pathological conditions. Abderhalden's sero-diagnosis of cancer was applied by Ball in 51 examinations for malignant conditions in the body and the reaction was always positive. In clinically malignant growths it was positive in 20, and negative in 8 cases in which there was a suspicion of malignancy; and positive in 4 and negative in 12 out of 16 clinically nonmalignant cases. In other words a diagnosis could be made by clinical symptoms without the aid of this intricate method of investigation in the vast majority of cases. For a masterly review of the whole matter, consult Bainbridge, *The Cancer Problem* (New York, 1914).

Davis calls attention to the frequency of **PARAFFIN CANCER** among workers in this material. Pure paraffin apparently is not concerned in the production of skin lesions, but rather the irritating substance separated from crude paraffin during the process of refining. The substance which seems to be implicated is the "pressed distillate." The crude paraffin is run into great presses and the distillate or heavy oil squeezed out. The paraffin remaining in the press, termed "slack wax," is scraped off by men who use spade-like instruments and work, as a rule, bare-armed. During the first few months of this employment the men suffer from "wax boils," affecting principally the arms and neck. After a number of years pigmented spots make their appearance on the skin of a certain proportion of the workers. Some of these spots are scaly, resembling the lesions of psoriasis; others are small rust-colored areas. These may be followed by wart-like growths, and finally by true epithelioma. It is believed by those familiar with the industry that protection of the skin from contact with the distillate, and strict cleanliness, prevent the development of all of these lesions.

ANILIN CANCER seems to affect the urinary passages, particularly the bladder, in workers among anilin dyes. The substances possessing the necessary irritating qualities are most of them distillation of coal and petroleum products and the tumors which they induce belong therefore to the tar and paraffin cancer group.

TOBACCO CANCER. Melzer in 1850 attracted attention to tobacco cancer. He studied the incidence of the disease at the General Hospital at Laibach during the years between 1787-1849; 433 patients had cancer and of these 142 had the growth upon the lip, 127 were men and 15 were women, all in adult life. These people smoked wooden, copper-sheathed pipes, with stems not over two inches long, so that the bowl came into almost direct contact with the smoker's lips. Among Stokes's 350 cases of cancer of the lip, only three were women, and these

were assiduous smokers—peasants from the west of Ireland. Most statistical studies of the incidence of cancer indicate the marked prevalence of the disease in the upper digestive and respiratory tract in the male sex, which is especially addicted to tobacco. Russell points out that cancer of the jaw and tongue increases with the increase of the habit of smoking. In Switzerland from 1905 to 1909 cancer of the lip was five times more frequent in men than in women, lingual cancer 10 times more frequent in men, and cancer of the larynx, parotid glands, and pharynx seven times more frequent. The irritating substances in tobacco are probably not only contained in the smoke, but also in the tobacco juice. Cancer of the cheek and mucous membrane of the mouth is apparently often produced by holding masses of tobacco against the cheek.

KANGRI-BURN CANCER occurs on the thighs or abdomen of the people of Kashmir in consequence of the custom of carrying a portable fire-basket beneath their clothing. Of 4902 tumors removed in the Kashmir Mission Hospital in the course of 25 years, Neve found 1720 were malignant, 1189 epitheliomatous or surface growths, and 484 were on the thighs or abdomen. Neve believed the irritation to be due to the heat, but other investigators point out that the skin of these patients is also subjected to the action of soot and gaseous emanations from the fire-baskets. In this connection it may be pointed out that chimney-sweep's cancer is undoubtedly due to the irritation of soot and is believed to be associated etiologically with the character of the coal (pit coal) which is used in England. Apparently this produces irritation of the skin similar to that brought about by paraffin and tar. Davis sums up his studies by pointing out the similarity of the lesions following chronic irritation of the above types, which he thinks suggests a similarity or even identity of the irritating agents in the several classes of cancer. The assumption is inevitable that there is some chemical body residing in certain coal and petroleum products which is capable of inducing inflammatory reaction in the tissues and finally epithelioma. Ross, Cropper, and Ross declare that they have demonstrated the presence of chemical bodies, 25 or 30 in number which are capable of inducing cell division in the human body. These substances they term "auxetics." Auxetics have been demonstrated in gas works tar, but not in blast furnace tar. They can induce atypical epithelial overgrowths in animals by the use of gas works tar containing auxetics, but obtain negative results in experiments with blast furnace tar.

Fibiger has for some time been studying cancers found in the stomach of rats which are apparently connected with a parasite peculiar to them. This seems to be a new species of *Spiroptera* and it has been found only in the numerous rats infecting sugar warehouses. None was found in 1100 rats from other parts of Denmark, nor in 350 from other countries. Fibiger considers the cockroach to be the intermediate host and thinks that these insects were probably brought in the sugar from the West Indies. The parasites were found in seven out of eight dead rats sent in from a West Indian port and in 52 out of 70 cockroaches. See **RADIOTHERAPY**.

CAPE COD CANAL. See CANALS, and MASSACHUSETTS, *Other Events*.

CAPE COLONY. See CAPE OF GOOD HOPE PROVINCE.

CAPEN, SAMUEL BILLINGS. An American merchant and philanthropist, died Jan. 30, 1914. He was born in Boston in 1842, and was educated in public and high schools of that city. In 1859 he entered the carpet store of Wentworth and Bright, and three years later became a partner in the business which finally took the firm name of Torrey, Bright, and Capen Company. From 1882 to 1899 he was president of the Congregational Sunday School and Publication Society, and from 1894 to 1899 of the Boston Municipal League. From 1905 until his death he was president of the board of trustees of Wellesley College, and from 1906 chairman of the executive committee of the Laymen's Missionary Movement of the United States and Canada. In 1899 he was elected president of the American Board of Commissioners for Foreign Missions and it was while traveling in the East in its interests that he died in China.

CAPE OF GOOD HOPE PROVINCE. One of the four original provinces of the Union of South Africa (q.v.). Capetown, the capital, had, according to the census of 1911, with suburbs, 161,579 inhabitants (85,442 whites); Capetown municipality had 87,159 (29,863 whites). Kimberley and Beaconsfield, 44,433 (17,507 whites); Kimberley municipality, 29,525 (13,598); Beaconsfield municipality, 14,294 (3,404); Kenilworth, 614 (505). Port Elizabeth, 30,688; with suburbs, 37,063 (20,007 whites). East London 20,867; with suburbs, 24,606 (14,899 whites). Grahamstown, 13,830; Paarl, 11,108; Simonstown, 4751; Vryburg, 2461; Mafeking, 2296. Of the total population, Europeans form about one-quarter and the colored races three-quarters; one-fifth of the population is urban.

The crownlands alienated in 1911 totaled 1,712,250 acres, bringing in a revenue of £62,015. Total area disposed of to December, 1911, 140,000,000 acres. The census of May 7, 1911, returned 974,266 morgen (one morgen is equal to 2.11654 acres) of land under cultivation, 376,873 morgen fallow, and 58,058,667 devoted to grazing. Wheat was grown on 230,916 morgen, yielding 1,305,006 muids; oats, 238,113 morgen, 1,228,927 muids; corn, 115,394 morgen, 1,727,864 muids; kafir corn, 9206 morgen, 299,422 muids; rye, 43,097 morgen, 144,132 muids; barley 43,002 morgen, 373,509 muids; tobacco 2084 morgen, 3,767,179 pounds; alfalfa 61,174 morgen, 100,233 tons. A muid of wheat, corn, peas, or beans weighs 200 pounds; oats and potatoes, 150 pounds; barley, 160 pounds. Wine output, 7,488,987 gallons; brandy, 617,040. There were (1911) in the province 2,715,330 cattle, 333,962 horses, 17,134,513 sheep, 7,953,414 goats, 505,730 swine, 47,159 mules, 191,086 asses, 782,087 ostriches.

The state-aided schools numbered June 30, 1911, 4306, with an enrollment of 217,095, and an attendance of 187,073; teachers, 8446.

Sir N. F. de Waal administered the province in 1914. See SOUTH AFRICA, UNION OF, for area, population, and other statistics.

CAPE VERDE ISLANDS. A group of Portuguese West African islands, having a total area of 1516 square miles, carrying a population (1910) of 142,552. Capital, Praia.

CARINTHIA. See AUSTRIA-HUNGARY.

CARLETON, BUCK G. An American surgeon and writer on medical subjects, died Oct. 20, 1914. He was born at Whitefield, N. H., in 1856, and was educated in the public schools of Littleton, N. H. He received his medical education at the New York Homeopathic Medical College, taking his degree in 1876. For a year he was in the medical department of New York University and a member of the house staffs of several hospitals. For several years he was demonstrator and professor of anatomy at the Homeopathic Medical College, and was consulting surgeon of the Hahnemann Hospital.

CARNEGIE FOUNDATION FOR THE ADVANCEMENT OF TEACHING. See section so entitled under UNIVERSITIES AND COLLEGES.

CARNEGIE GEOPHYSICAL LABORATORY. See GEOLOGY and MINERALOGY.

CARNEGIE INSTITUTE OF TECHNOLOGY. An institution for technical education founded in Pittsburgh in 1909 by Andrew Carnegie. Previous to 1912 it was known as the Carnegie Technical School. The enrollment in the autumn of 1914 was 3285, and the faculty numbered 202. The institute consists of four separate schools, each with its own faculty, buildings, and student body. These are the School of Applied Science, the School of Applied Design, the School of Applied Industries, and the Margaret Morrison School for Women. The four schools offer night courses in practically the same subjects as are given in the day courses. There were no notable changes in the faculty during the year. The only noteworthy benefaction received during the year was a gift of \$2,000,000 from Mr. Carnegie. The amount of productive funds amounts to \$8,000,000, and the present income to \$530,746. The library contains 350,000 volumes, and the students have the privilege of using the Carnegie Library of Pittsburgh. The director is A. A. Hammerschlag.

CARNEGIE INSTITUTION OF WASHINGTON. A summary is given below of the important work carried on in 1914 in the several departments of the institution.

DEPARTMENT OF BOTANICAL RESEARCH. The greater part of the work of this department is carried on in its principal laboratory at Tucson, Ariz. Relating to it, however, comprehensive studies of desert plant life in many parts of the globe are undertaken. A study was made during the year of several desert basins in the Western States similar in general characteristics to the Salton Sea. In addition to the work carried on by members of the departmental staff, various investigations were pursued by about 20 collaborators, several of whom were temporary residents at the Desert Laboratory. The facilities of this laboratory were enlarged during the year by the completion and equipment of a specially designed small building for studies in photo-chemistry.

DEPARTMENT OF ECONOMICS AND SOCIOLOGY. The work of this department has been confined in recent years to the preparation of divisional monographs. Dr. Victor S. Clark, in charge of the division of manufactures, has devoted his time exclusively to this work. Of the comprehensive "Index of Economic Material in the Documents of the States" projected by the department and prepared under the direction of

Miss A. R. Hasse, the volume for New Jersey was in press at the end of the year. The volumes of this index for eleven different States have already been issued.

DEPARTMENT OF EXPERIMENTAL EVOLUTION. The observational, statistical, and physical methods applied by this department are constantly adding to the sum of facts and of inductions essential to advances in biological knowledge. During the past year observations and experiments were made on mucors, plants, pigeons, poultry, and seeds, while the director continued his statistical studies in the relatively new field of departures from normality in mankind. Among the most important researches of the year are those of the director in human heredity, those of Dr. Blakeslee and Dr. Gortner on mucors, those of Dr. Riddle on the Whitman pigeons, those of Dr. Harris on the characteristics of seeds, and those in cytology by Mr. Metz. Dr. R. A. Gortner resigned during the year to accept a position in the University of Minnesota.

GEOPHYSICAL LABORATORY. In less than a decade this establishment has not only accomplished the formidable task of constructing the necessary apparatus and of preparing many of the pure minerals concerned, but has already begun the processes of analysis and synthesis which are leading to extensive additions to our knowledge of rock and mineral formations found in the earth's crust. This department published during the year 48 papers, many of them in German as well as in English. See **CHEMISTRY**.

DEPARTMENT OF HISTORICAL RESEARCH. Investigations of this department have proceeded effectively during the year. In addition to the members of the permanent staff, several collaborators took part in these investigations, which required explorations of historical archives in England, Scotland, France, Spain, Holland, Russia, and Switzerland. There were published during the year *Guide to the Materials for American History to 1783*, in the *Public Record Office of Great Britain*, and *Guide to the Materials in London Archives for the History of the United States Since 1783*. Work on the preparation of a similar guide to the data on American history in the archives and libraries of Paris was interrupted by the war. Work in Holland was also suspended, but researches in Great Britain and Russia suffered little interruption. Progress was made on the projected *Atlas of the Historical Geography of the United States*.

DEPARTMENT OF MARINE BIOLOGY. In accordance with plans approved by the Trustees in 1912, an expedition to Torres Straits, Australia, was undertaken in the latter part of 1913, where observations and examinations in the geological formation of Thursday Island and other islands were undertaken. On returning to America the director was engaged during April and May of 1914 in two minor expeditions with the departmental vessel *Anton Dohrn*. These researches were carried on along the Florida Keys.

DEPARTMENT OF MERIDIAN ASTROMETRY. The activities of this department are concentrated on the derivation of stellar positions for the comprehensive catalogue in preparation, on supplementary measurements of stellar coördinates with the meridian circle of the Dudley Observatory, and on investigations of residual

stellar motions. Researches were also carried on on the problems of star-drift, including the speed and direction of motion of our solar system. A catalogue on stars is progressing favorably.

NUTRITION LABORATORY. Favorable results have followed the location of the Nutrition Laboratory in Boston near the Harvard Medical School. Several improvements were made in the laboratory during the year and a number of additions to equipment were installed. These latter include new respiration apparatus for studies of metabolism in muscular work of men and of small animals, a reconstruction of an earlier form of bed calorimeter, and additional apparatus for photo-electric registration of physiological action in subjects under observation, whether near by or at a distance.

DEPARTMENT OF TERRESTRIAL MAGNETISM. The extensive operations of this department on the oceans and in foreign countries were supplemented during the year by the new departmental laboratory, whose completion and occupation took place nearly simultaneously with the beginning of the second decade of the department's existence. This laboratory and its site provide greatly enlarged facilities for research as well as unsurpassed quarters for the resident departmental staff. The nonmagnetic ship *Carnegie* on June 18, 1914, left for a cruise in the North Atlantic. In this, the third of her longer expeditions, she traversed about 10,000 miles. At the end of the year she was refitting for a longer cruise during 1915-16 in southern latitudes.

SOLAR OBSERVATORY. At the end of the year the Mount Wilson Solar Observatory completed a first decade of its history. Progress in the construction of the 100-inch telescope was made during the year and many additions and improvements in the apparatus already installed at the observatory were made. The principal results of the work are noted in the article **ASTRONOMY**.

During the year the Institution lost two members of its Board of Trustees,—Silas Weir Mitchell (q.v.) and John Lambert Cadwalader (q.v.). At the annual meeting of the Board of Trustees on December 11, Dr. Simon Flexner resigned as trustee and the following new members were elected: Honorable Charles Payne Fenner, Honorable Henry Cabot Lodge, Mr. George Wharton Pepper, and Dr. Theobald Smith. At this meeting a Department of Embryology was established under the direction of Professor Franklin P. Mall of the Johns Hopkins Medical School. The president of the Institution is Robert S. Woodward.

CARNIOLA. See **AUSTRIA-HUNGARY**.

CAROLINE ISLANDS. A group of islands off the north coast of New Guinea. The islands were ceded in 1899 by Spain to Germany, and became administratively a part of the German New Guinea Protectorate. Area of main islands, 307 square miles; population (1911), 55,000.

CARR, CAMILLO CASSATTI CADMUS. An American soldier, died July 24, 1914. He was born in Harrisonburg, Va., in 1842. He entered the University of Chicago in 1859, but left in his senior year before graduation to enlist in the army. He served as a private in 1862-3, in the latter year was made second lieutenant, and in 1864 first lieutenant. He was wounded in the

battles of Todd's Tavern, and Cedar Creek, Va. In 1864 he was promoted to be captain. After the Civil War he was engaged in service against the Indians and took part in the Apache campaigns in Arizona from 1867 to 1882. In all he spent over twenty years campaigning in the Indian country. From 1885 to 1894 he was cavalry instructor in the United States Infantry and Cavalry School at Fort Leavenworth, Kan. In the following year he served as inspector-general of the Department of Columbia, and in 1898-9 was in command of the western part of Porto Rico. He became lieutenant-colonel, commanding the Fifth Cavalry, in 1898. In 1900-01 he commanded a regiment in the Philippine Islands. He was in charge of the Department of Missouri in 1904, and the Department of Dakota from 1904 to 1906. He was retired by operation of law with the rank of brigadier-general in 1906. He was a member of several patriotic societies. He translated from the French of Gen. F. de Brack, *Cavalry Outpost Duties*, and was a frequent contributor to military journals.

CARRANZA, VENUSTIANO. See **MEXICO**, *History*.

CARSON, SIR EDWARD. See **GREAT BRITAIN**, *History*, *passim*.

CASTELNAU, CURIÈRES DE. See **WAR OF THE NATIONS**.

CATHOLIC UNIVERSITY OF AMERICA. An institution of higher learning under the auspices of the Roman Catholic Church, founded in Washington, D. C., in 1867. The students enrolled in the several departments in the autumn of 1914 numbered 700, with a faculty numbering 75. The university received during the year a gift of \$500,000 from the Knights of Columbus, and the same amount from the Theodore B. Barselin estate. There were no notable changes in the faculty during the year. The total endowment of the university amounted on June 30, 1914, to \$2,721,277, and the total income to \$315,350. The library contains about 80,000 volumes. The rector is Rt. Rev. Thomas J. Shahan.

CATSKILL AQUEDUCT. See **AQUEDUCTS**.

CATTERALL, RALPH CHARLES HENRY. An American historian and educator, died Aug. 2, 1914. He was born in Bolton, England, in 1866, and came with his parents to the United States in 1869. He graduated from Bucknell University in 1891, and from Harvard in the following year. He took post-graduate studies at the University of Chicago, receiving the degree of Ph.D. in 1902. From 1894 to 1902 he was instructor in history at the University of Chicago. In the latter year he became assistant professor of history in Cornell University, serving in that chair until 1905, when he was appointed professor of modern history. He retained this position until his death. He was the author of *The Second Bank of the United States* (1902).

CAVALEY. See **MILITARY PROGRESS**.

CAWEIN, MADISON JULIUS. An American poet, died Dec. 9, 1914. He was born in Louisville, Ky., in 1865, and received a high school education. Mr. Cawein began writing when he was still a young man and he received early recognition as one of the most gifted and musical of American poets. Some of his lyrics and poems on nature are especially beautiful. His verses appeared in magazines and periodicals in

the United States and England. He was a prolific writer and his published volumes include: *Blooms of the Berry* (1887); *The Triumph of Music* (1888); *Red Leaves and Roses* (1893); *Poems of Nature and Love* (1893); *The Garden of Dreams* (1896); *Weeds of the Wall* (1901); *A Voice on the Wind* (1902); *Nature-Notes and Impressions* (prose and verse, 1906); *An Ode, in Commemoration of the Founding of the Massachusetts Bay Colony* (1908); *New Poems* (1909); *The Giant and the Star* (1909); *Minions of the Moon* (1913); *The Poet and Nature and the Morning Road* (1914). He wrote also *The Shadow Garden and Three Other Plays* (1910). In addition his *Poems, Selected by the Author, with Foreword by William Dean Howells*, was published in 1913. He was a member of the National Institute of Arts and Letters.

CAYENNE. See **FRENCH GUIANA**.

CELEBRATIONS. There were three great commemorative celebrations in the United States during the year, as follows: the Lake Champlain Centenary in Plattsburg, N. Y., the Star Spangled Banner Centenary in Baltimore, Md., and the Commercial Tercentenary Celebration in New York City.

LAKE CHAMPLAIN CENTENARY. This had for its purpose the commemoration of the hundredth anniversary of the battle of Lake Champlain on Sept. 11, 1814, when Com. Thomas Macdonough, with a fleet of 14 vessels carrying 86 guns and 850 men, completely defeated a British fleet of 16 vessels, carrying 96 guns and about 1000 men under the command of Capt. George Downie. A Plattsburg Centenary Commission, of which Francis Lynde Stetson was made chairman, was created by the New York Legislature and \$125,000 was appropriated while Congress contributed a like amount. The exercises began on September 6, continued until September 12, and included, besides religious services and addresses, several historical pageants.

STAR SPANGLED BANNER CENTENNIAL. In Baltimore, Md., during the week of September 6, was held a centennial celebration in honor of the battle of North Point which occurred on Sept. 11, 1814, when Gen. John Stricker with 1700 men repulsed a superior land force under Sir Robert Ross (aided by a naval contingent under Admiral George Cockburn); and also in memory of the writing of the Star Spangled Banner by Francis Scott Key on September 13 (in recognition of the heroic defense of Fort McHenry against the British). The National Star Spangled Banner Centennial Commission was incorporated on Nov. 3, 1913, with James H. Preston as president, and for the expenses of the celebration Baltimore contributed \$50,000, Maryland, \$75,000, and the citizens of Baltimore \$40,000. The exercises began on Sunday (September 6), with services in the churches, "Patriotism" being selected as the theme for the addresses, a public concert in the afternoon, and general illumination of the city in the evening. Monday (Labor Day) was given up to a large civic and industrial parade in which there were numerous floats, showing typical industries. The *Constellation*, the oldest used vessel in the U. S. navy, arrived, escorted by United States and foreign warships. Tuesday was devoted to a floral automobile parade, colonial lawn fêtes, and a grand carnival in the evening. Wednesday was celebrated by a parade of national orders with allegorical

floats, and the unveiling of four tablets on historic buildings in Baltimore. Thursday's programme included the unveiling of tablets commemorative of historic events, notably one on Fort McHenry; and also an electrical historic pageant with 24 floats illustrative of incidents and events of the War of 1812, the battle of North Point, and historical happenings leading to the dawn of the morning when Key wrote his immortal poem. On Friday was given a parade of the army and navy, State and visiting militia and military organizations, while in the evening there was a military ball in honor of the visiting military and other distinguished guests. Saturday was designated as "Star Spangled Day" and was celebrated by the dedication of Fort McHenry as a public park, with an address by Secretary Bryan representing President Wilson; the singing of Key's anthem by 6000 school children forming a human flag, and the unveiling of a statue of Maj. George Armistead; while in the evening there was a grand banquet and elaborate fireworks. Throughout the week Baltimore was specially illuminated each evening; and band concerts, historical exhibitions and other entertainments were held. Consult *Official Programme and the Story of Baltimore*, 165 pp. (Baltimore, 1914).

NEW YORK COMMERCIAL TERCENTENARY. This celebration was organized to commemorate the granting on March 27, 1614, of a general charter by the States General of the United Netherlands, promising to give an exclusive charter for four voyages to any Dutchman who should discover new passages, havens, countries, or places good for trading. During the summer of that year, certain merchants of Amsterdam and Hoorn sent out five ships to New Netherland, and upon making report to the States General of their discoveries, were granted, on Oct. 11, 1614, the exclusive privilege of trading to this region for four voyages. This was the beginning of the regularly chartered commerce of New York. After this trading had continued 10 years, the Dutch made a permanent settlement in 1624 at what is now Albany, and in 1626 New Amsterdam was permanently settled on Manhattan Island.

In December, 1912, Mayor Gaynor of New York City appointed a citizens' committee to arrange for the suitable observance of the completion of three centuries of American commerce, which committee was subsequently enlarged and became incorporated as the New York Commercial Tercentenary Commission, of which Gen. Howard Carroll became president. The celebration began on March 27 and continued until November 21. The first event was on March 27 at Fort Wadsworth, Staten Island, when tableaux representing the beginning of trading with the Indians were presented, the participants being New York State Indians and descendants of old Dutch families of New York. In the evening a public meeting was held at which addresses were made by Mayor Mitchell of New York and Mayor Stevens of Albany. On August 12 a local festival was held at New Brighton, Staten Island, at which historical tableaux were produced and folk dances and songs of all nations were rendered by school children. On August 18 a local festival was given in Brooklyn which included athletics, drills, dancing, and historical scenes enacted in costume, the latter commemorating particu-

larly events in the history of Brooklyn. On August 19 a local festival was given in Bronx Borough with tableaux and dances illustrating the Indian, Dutch, English Colonial, and modern periods. On August 29 another local festival was given in Central Park, New York City, and consisted of a pageant of Manhattan. Ten floats represented the Indian Period, Dutch Period, Early Education, Education of To-day, Recreation, Tribute of the Nations, Industrial Education, Cog Wheel, Band Box, Commerce and Horn of Plenty. On Saturday, October 24, the Jewish congregations, and on Sunday, October 25, the Christian churches were requested to observe the day with special recognition of "God in History." On October 28, an automobile pageant parade was held in the evening, followed by a reception to Governor Glynn and Mayor Mitchell, honorary presidents of the Commission. On October 29 there was a reception at the Metropolitan Museum of Art. On October 31 historic cannons were dedicated in Battery Park and later a Harlem Pageant was given; while in the evening a Commercial Pageant consisting of historical, educational, commercial, industrial, and symbolical floats, patriotic bodies, and other interesting features paraded. From November 7 to 21 there was held in the Grand Central Palace a series of exhibits representing Old New York and Modern New York, with displays by merchants and manufacturers showing the development of the commerce and industry of the city and State as well as the country at large. An exhibition of the life, industries, and arts of the American Indians, with illustrated lectures, was a feature of the Commercial Exhibits. In addition there were public musical festivals given in the various boroughs of New York City on October 27, 29, and 30, and daily during November 1-6. During the week beginning October 26, many of the leading thoroughfares were illuminated and adorned by strings of incandescent lights and pennants on either side.

The programmes of these three historical celebrations have been given in some detail, as they show the most recent development of celebrations in which the money is spent so that the people may enjoy the spectacular features without cost to themselves, while the historical features are by no means neglected. The most valuable incident of the Star Spangled Banner Celebration in Baltimore was that upward of 20 historical sites were permanently marked by artistic tablets or memorial statues.

PEACE CELEBRATION. (Consult *NEW INTERNATIONAL YEAR BOOK*, 1913, p. 237.) Owing to the war in Europe the programme of the American Peace Centenary Committee has been postponed until hostilities shall have ceased. In the meanwhile however, strong committees (nearly a hundred in number), have been organized in all of the larger cities of the United States and also in Great Britain, Canada, Newfoundland, and elsewhere throughout the British Empire. Among the things already accomplished may be mentioned the purchase in England of Sulgrave Manor in Northamptonshire, the ancestral home of George Washington; and the publication of a *Historical Review of the Century of Peace* by William A. Dunning. Among the projects that have been started are, a statue of Lord Chatham to be presented to the United States; a replica of the statue of

Lincoln by St. Gaudens to be presented to Great Britain; a statue of Francis Parkman to be presented to Canada; the erection in the city of Washington of a memorial in commemoration of the motherhood and womanhood of the Anglo-Saxon-Celt-Teutonic world, to be known as the Queen Victoria Memorial; and a great peace memorial to be placed on a peak of the Rocky Mountains.

CELLI, ANGELO. An Italian scientist, died at Rome in May, 1914. He was born in 1857, and after completing his medical education was appointed at a comparatively early age professor of hygiene at the University of Palermo. A year afterward he became professor of hygiene in the medical faculty of the University of Rome, where he remained until his death. He was later appointed Chief of the National Board of Health and became a Senator. As a teacher, investigator, and promoter of social legislation his work was important. The organized efforts for the suppression of malaria, and the sanitary improvement of the Campagna region, were mainly due to his work. His activity covered a wide field, including researches on the parasites which cause malaria, on cerebrospinal meningitis, cholera, pellagra, dysentery, rabies, flies as transmitters of disease, and many other topics. He was foremost in bringing about the government monopoly of quinine and the sale of that drug practically at cost in every post office. At the World's Fair at St. Louis in 1904 he was one of the leading delegates to the International Congress of Arts and Sciences.

CELLOPHANE. See **CHEMISTRY, INDUSTRIAL.**

CELTIC PHILOLOGY. See **PHILOLOGY, MODERN.**

CEMENT. During 1914, the general business depression and slackening of building operations exerted a marked effect upon the cement industry, and before the outbreak of the European war cement mills were operating at but little more than 50 per cent of capacity. The business with South America, Asia, and Africa that confidently had been expected to result from hostilities in Europe failed to develop. It was said that complications concerning shipping and exchange acted to restrain the trade. Later in the year, the business remained at about the same level as during the spring months. The total quantity of Portland, natural, and puzzolan cement produced in the United States in 1913 was 92,949,102 barrels, valued at \$93,001,169, as compared with 83,351,191 barrels, valued at \$67,461,513 in 1912. Almost the entire product was Portland cement. This amounted to 92,097,131 barrels, valued at \$92,557,617, which represents an increase of nearly 10,000,000 barrels over the production of 1912, and an increase in value of about \$25,500,000. Pennsylvania produced by far the greatest amount in 1913, or 28,701,845 barrels. Indiana was second, with 10,872,574 barrels. California ranked third in the production; New York fourth; Illinois fifth. These States all produced an excess of 5,000,000 barrels. There were producing plants in twenty-five States in 1913. The apparent consumption of Portland cement in 1913 was 85,809,649 barrels. The industry has shown great progress. In 1900 the total production was 8,482,020 barrels. One of the most important uses of cement at the present

time is in the construction of concrete roads. The imports of cement into the United States in 1913 was approximately 84,630 barrels, valued at \$138,187. There has been a continuous decline in the imports of foreign cement for several years. The total quantity exported in 1913 was 2,964,358 barrels, valued at \$4,270,666. Most of this was Portland cement.

The natural cement produced in the United States in 1913 amounted to 744,658 barrels, valued at \$345,889. This was a considerable decrease from the production of 1912. Natural cement was produced in 1913 in thirteen plants distributed in eight States. New York is first in the production of natural cement. Puzzolan was manufactured during 1913 at three plants, respectively in Alabama, Pennsylvania, and New York. The total output was 108,313 barrels, valued at \$97,663. ♦

Production of Portland cement during 1914 in the United States was estimated by the United States Geological Survey at 88,514,000 barrels, a decrease of 3.8 per cent from the output of the previous year. Estimated shipments during 1914 were 86,715,000 barrels, a decrease of 2.2 per cent from the figures of 1913. While the Lehigh, Illinois, Indiana, and Pacific Coast districts reported decreases of both production and shipments of from 9 to 12 per cent, encouraging increases were shown in the New York, Maryland-Virginia, Iowa-Missouri, and Rocky Mountain districts during 1914. See **CONCRETE.**

CENTENARIES. See **CELEBRATIONS** and **EXPOSITIONS.**

CENTRAL AMERICA. See articles on Central American Countries.

CEROLIN. This new preparation consists of the glycerides of fatty acids together with cholesterol, lecithin, and ethereal oil, all of which are found in yeast, of which cerolin is claimed to be the active constituent. Recent investigations indicated that the laxative action of yeast depends on its fatty and lipid constituents, rather than the ferments. Cerolin was said to be useful in boils, acne, and other purulent affections of the skin. It was also said to benefit cases of habitual constipation, leucorrhea, erosions of the cervix and similar affections. The substance is a neutral honey-like semifluid mass of a yellowish to brownish color and has the odor of yeast. It is prepared by extracting fresh purified beer yeast with alcohol and separating the dissolved fat from the alcoholic extract by suitable means.

CEYLON. An island in the Indian Ocean, lying south of India; a British crown colony. Capital, Colombo.

AREA AND POPULATION. The total area of the island is 25,332 sq. miles. The population, March 10, 1911, numbered 4,110,367, an increase of 14.9 per cent over the population as enumerated in 1901. The Sinhalese numbered 2,715,686; the Tamils, 1,060,167; Burghers and Eurasians, 26,673; Moors, 267,054; Malays, 12,992; Europeans, 8524; others, 19,271. The population was divided according to religion as follows: 2,474,393 Buddhists, 939,701 Hindus, 284,482 Mohammedans, 410,525 Christians, and 1266 others. The Indian coolies on the tea estates number about 440,000; they are not indentured. Including coolies born and settled in Ceylon, the total number of plantation laborers is estimated at 510,000. The principal towns with their population in 1911 follow: Colombo, 213,396;

Negombo, 13,152; Moratuwa, 27,253; Kalutara, 13,006; Kandy, 30,148; Jaffna, 40,539; Galle, 40,187; Matara, 13,851; Batticaloa, 10,715; Trincomalee, 9086; Kurunegala, 8163; Badulla, 6488.

EDUCATION. The total number of scholars in government schools at the end of 1912 was 104,049, in government-aided schools, 221,233, and in unaided schools, 34,375. In 1868, the total number of scholars in all schools was 6897. Government expenditure in 1912, Rs. 1,707,218. Vernacular instruction is free, and all government schools are nonsectarian. There are industrial, technical, medical, and normal schools.

PRODUCTION. About one-quarter of the total land area is under cultivation as follows: 942,621 acres under coconut palms; 680,574 under rice; 580,845 under tea; 101,706 under grains other than rice; 215,000 under rubber; 47,292 under cinnamon; 43,358 under cacao; 16,241 under tobacco; 1512 under coffee; and 263 under cinchona. The development of the rubber industry is shown by the fact that in 1898 only 750 acres were planted to rubber; in 1901, 2500; in 1904, 11,000; in 1905, 40,000; in 1906, 100,000; in 1910, 186,634; and in 1911, 215,000.

The export of tea in 1912 was 192,019,591 pounds; in 1911, 186,594,055 pounds; in 1900, 149,264,602 pounds; in 1890, 45,799,518. Coconut-palm products, exported in 1912 were valued at Rs. 32,435,862; cinnamon, Rs. 2,835,591; cacao, Rs. 2,718,041.

Plumbago mines and pits in the island number 449, with an estimated total yield of 654,650 cwts. in 1912, valued at over Rs. 8,346,787. Gem quarries number 1986. The government has resumed possession of the Manaar pearl banks. Salt is a government monopoly. Native industries are gold, silver, ivory, and tortoise-shell work, pottery-making, wood-carving, etc.

The live stock in 1907 numbered 1,559,271 cattle, 98,746 sheep, 179,123 goats, 3985 horses, and 96,305 swine.

COMMERCE. The total value of all imports for the calendar year 1912 was Rs. 181,999,991; in 1911, Rs. 164,405,788; 1910, Rs. 163,520,076; 1909, Rs. 133,782,127; 1903, Rs. 116,259,636. The chief imports are rice from India, valued at Rs. 46,867,538 in 1912, and textiles and coal from the United Kingdom. The total value of all exports for the calendar year 1912 was Rs. 198,954,902; 1911, Rs. 182,028,968; 1910, Rs. 166,569,107; 1909, Rs. 146,899,631; 1903, Rs. 108,764,335. The total customs revenue in 1912 was Rs. 13,393,672. Imports and exports to and from the United Kingdom in 1912 were valued at Rs. 50,999,044 and Rs. 97,756,191 respectively; in 1911, Rs. 43,443,786 and Rs. 87,359,604. Total tonnage entered and cleared during 1912, 15,420,142, of which 10,114,485 tons British; during 1911, 14,926,764, of which 9,571,159 tons British.

COMMUNICATIONS. All railway lines are owned and worked by the government. Broad-gauge lines extend from Colombo to Bandarawela, 160½ miles; from Polgahwela to Kankasanturai, 212¼ miles; Peradeniya Junction to Kandy and Matale, 21 miles; Ragama Junction to Mahara Quarry, 1½ miles; Colombo to Matara, 98½ miles; Ragama to Negombo, 14½ miles; Fort Junction to Wharf, 1¼ miles. Narrow-gauge lines connect Colombo with Yatiyantota, 47¾ miles; Avisawella with Ratnapura, 27 miles; Nanu Oya with Ragalla, 19¼

miles. Total railway mileage, 604½ miles. The total cost of construction to June 30, 1912, was Rs. 102,367,082. Revenue for the year ended June 30, 1912, Rs. 14,113,877; expenditure, Rs. 6,337,583.

There are broad-gauge lines under construction from Madawachchi to Talaimannar, 66 miles; Negombo to Chilaw, 27 miles; Bandarawela to Badulla, 21 miles. A narrow-gauge line is projected from Ratnapura to Kahawatte (for Pelmadulla), 17 miles. There is a plan for an embankment along the islets and shoals of "Adams Bridge," for uniting the railway systems of India and Ceylon; which, on completion of the Manaar extension, will be brought within twenty miles of each other.

Ceylon is in direct telegraphic communication with India, and thence with Europe and the East. There are internal telegraph and telephone systems.

FINANCE AND GOVERNMENT. The unit of value is the rupee, worth 33.44 cents. The revenue is derived mainly from customs duties, land sales, licenses, salt, stamps, and railway receipts. Salt is a government monopoly, and the revenue from its sale for the calendar year 1912 was Rs. 1,522,542. The total revenue for the calendar year 1912 was Rs. 50,156,329; for the fiscal year 1911-12, Rs. 47,264,222; for the calendar year 1910, Rs. 43,741,758. Expenditure, 1912, Rs. 49,277,370; 1911-12, Rs. 48,643,687; 1910, Rs. 36,467,708. The public debt stood Dec. 31, 1912, at Rs. 91,960,909.

The colony is administered by a Governor (Sir Robert Chalmers in 1914), aided by an Executive Council of six members and a Legislative Council of twenty-one members.

The Maldivé Archipelago, 400 miles to the westward, is tributary to Ceylon. There are 17 groups, with about 72,200 inhabitants.

CÉZANNE. See PAINTING AND SCULPTURE.

CHAFFEE, ADNA ROMANZA. An American soldier, died Nov. 1, 1914. He was born in Orwell, Ohio, in 1842, and was educated at the public schools. At the outbreak of the Civil War he enlisted as a private in the Sixth United States Cavalry; served throughout the war and at its close had risen to the rank of first lieutenant in the regular army, with a brevet of captain for gallant services. He remained in the military service after the close of the war and took part in many campaigns against the Indians. He was promoted to be a major in 1885, lieutenant-colonel in 1897, brigadier-general in 1898, and major-general in July of the same year. In the Spanish-American War he commanded the third brigade in the Second Division of the Fifth Army Corps. From 1898 to 1900 he was chief of staff of the Division of Cuba. He commanded the China relief expedition in 1900-01, and in 1901-02 commanded the Division of the Philippines. He was commander of the Department of the East in 1902-03, and was assistant to the chief of staff in 1903-04. From 1904 to 1906 he was chief of staff of the United States Army. After over forty years of service he was retired at his own request with the rank of lieutenant-general, in 1906. General Chaffee was one of the finest examples of the officers who rose from private to the highest rank. Although he was a stern disciplinarian, he never demanded of others what he hesitated to do himself, and superiors and subordinates

united in praise of the earnest, tireless way in which he accomplished every task that was set for him to do.

CHAMBERLAIN, ALEXANDER FRANCIS. An American anthropologist and educator, died April 9, 1914. He was born at Kenninghall, England, in 1865, and graduated from Toronto University in 1886. He took post-graduate studies at that university and at Clark University, receiving the degree of Ph.D. from the latter in 1892. Until his death he was professor of anthropology at Clark University. From 1900 to 1908 he was editor of the *Journal of American Folk-Lore*, and was department editor of the *American Anthropologist*. He was a member of many American and foreign anthropological societies and made special investigations of the Kootenay (British Columbia) Indians under the auspices of the British Association in 1891. From 1904 to 1905 he was chairman of the Democratic City Commission of Worcester, and in the latter year he was Alderman-at-large of the city of Worcester. His published writings include: *Child and Childhood in Folk Thought* (1896); *The Child—A Study in the Evolution of Man* (1900); *Poems* (1904). He also published many essays and papers on anthropological and other subjects, and contributed to the *NEW INTERNATIONAL ENCYCLOPEDIA* and other works of reference.

CHAMBERLAIN, JOSEPH. An English statesman, died July 4, 1914. He was born in London in 1836, the eldest son of Joseph Chamberlain. More than 100 years before his birth his ancestors had carried on an extensive business as leather merchants and shoe manufacturers in Cheapside, London, and Chamberlain's father planned for him a mercantile career. He was sent to a school by his parents, but at the age of sixteen left to enter upon the business of screw manufacturing in which his father was also interested. The business was prosperous, but not highly remunerative. Shortly after his connection with the business he invented a screw with a point so sharp that it could be driven into the board without a hole having been previously made for its insertion. This improvement resulted in such an increase in the business that at the age of thirty-eight Joseph Chamberlain was able to retire and to devote himself to his real interest, that of politics. He had in the meantime removed to Birmingham, which from that time on remained his residence. In 1870 he became a member of the first Birmingham School Board, and in 1873 was elected mayor of the city. He was twice reelected. The city government of Birmingham was at this time at a low ebb of civic morality, but Chamberlain made it famous among the cities of the world as a well-governed municipality. The slums were wiped out and a boulevard was constructed over the place where they had stood. One of the chief reforms which he put through as mayor was the securing of legislation which led to the city's ownership and management of the local water works and gas works. The plan was highly successful and the cost of gas to the public was reduced. He became widely known as a Radical, and his chief strength at this time was with the common people of Birmingham, with whom he was immensely popular. His first attempt to enter Parliament was unsuccessful, but his forceful speeches attracted the attention of John Morley, who invited him to contribute to the

Fortnightly Review. His papers in this journal were sensational. They attacked bitterly the conservatism of Mr. Gladstone and the Manchester school of politics. Mr. Gladstone's offer in 1874 to abolish the income tax was met by a cynical attack by Chamberlain. Gladstone was openly accused of trying to perpetrate a fraud on the working classes by offering in return for votes relief from their burdens. Chamberlain was finally elected to Parliament in 1876, and he had the advantage of a reputation already established. His first speech, delivered a few weeks after he took his seat, caused a stir. As a result of his contribution to the victory of the Liberals in 1880 he was given a seat in the Cabinet with the presidency of the Board of Trade. Up to 1885 he was the only Radical in a Liberal Cabinet. In the election of 1885 the office of First Lord of the Admiralty was offered to him, but he declined it in order to go back to the presidency of the Board of Trade. He hesitated, however, about joining this Cabinet in any post, replying to Mr. Gladstone's invitation that he would not be a party to any scheme for a separate Parliament in Dublin. He finally consented to accept upon the understanding that he should be free to resign if the Irish measure put forward by the Government should be one of which he felt he could not approve. When the Irish bill was completed Chamberlain, exercising this right, resigned, and was followed by Lord Hartington, John Bright, and others. The Ministry fell, and Mr. Chamberlain was the subject of a storm of abuse for what his enemies called his "treachery." He then threw his strength on the side of the Conservative element and formed the Liberal Unionist party, to which Mr. Gladstone owed his defeat. He was sent to the United States on a diplomatic mission in connection with the fisheries dispute between the United States and Canada, and from 1895 to 1903 served as Secretary of State for the Colonies. One of the most notable features of his official life was his share in the conduct of the Boer War and his mission to South Africa to reconcile the Boers to England. In 1903 he launched at Birmingham his scheme for the revision of the fiscal policy of the country and the adoption of a policy of "preferential tariffs." In September of that year, believing such a policy to be at variance with the wishes of the majority of the various constituencies, he resigned from the Ministry in order to devote himself to explaining and popularizing his proposal. Shortly after his resignation, however, his health and powers of mind began to fail, and he was obliged to take a trip to the Continent for his health. His last appearance in the House of Commons occurred on Feb. 16, 1910. He was then in his seventy-fourth year and in such feeble physical condition that he was unable to sign his name in the book of members. Mr. Chamberlain was one of the most commanding personalities of his time. It is frequently said of him that he had more American characteristics than English. He had great capacity for leadership and was equally effective as a legislator, administrator, orator, and debater. In 1888 he married Mary Endicott, the daughter of William C. Endicott, at one time Secretary of War in the Cabinet of President Cleveland. Mr. Chamberlain was chancellor of the University of Birmingham in 1901, and was at one time Lord Rector of Glasgow University.

CHAMBERLAIN, JOSHUA LAWRENCE. An American soldier and educator, died Feb. 24, 1914. He was born in Brewer, Me., in 1828, and graduated from Bowdoin College in 1852. In 1862 he was commissioned lieutenant-colonel of the Twentieth Maine Infantry and later became its colonel. This regiment took a prominent part in the Battle of Gettysburg, and General Chamberlain received the Congressional Medal of Honor for "daring heroism" in holding the position of Little Round Top and carrying Great Round Top. After this battle he commanded a brigade of the fifth army corps. In 1864 he was promoted brigadier-general by General Grant "for meritorious and efficient services in battle and especially gallant conduct in leading his brigade against the enemy in the assault on Petersburg." This is said to be the only promotion made by General Grant on the field of battle. He was brevetted major-general on March 29, 1865, for "conspicuous gallantry in action," and was appointed to command the parade at the formal surrender of Lee's army at Appomattox in April of that year. Up to the close of the war he commanded the first division of the fifth corps. After the war he declined a colonelcy in the regular army and was honorably discharged on Jan. 15, 1866. During his services he was three times wounded, once almost mortally. From 1861 to 1871 he was Governor of Maine and was major-general of the militia of the State from 1879 to 1880. From 1871 to 1883 he was president of Bowdoin College, and from 1874 to 1879 was also professor of mental and moral philosophy in that college. He was lecturer on political science and public law at Bowdoin from 1883 to 1885. In 1878 he was United States Commissioner at the Paris Exposition, and in 1884 was president of the Society of the Army of the Potomac. He was also an official or member in many other patriotic, literary, and scientific societies. He delivered many orations at the dedication of monuments, commemorating the Civil War, and also lectured on Civil War subjects, notably on the Battle of Gettysburg. His published writings include: *Maine, Her Place and History* (1876); *American Ideals* (1890); *Ethics and Politics of the Spanish-American War* (1898); *The New Nation* (1899); *De Monts and Acadia* (1904); *Ruling Powers in History* (1905). He also contributed articles to several encyclopædias. From 1900 to the time of his death he was surveyor of customs at the port of Portland, Me.

CHAPARRO. See DYSENTERY.

CHARITIES. Recent years have seen an unprecedented expansion of the scope, purposes, and financial resources of charitable and philanthropic organizations in the United States and Europe. While 1914 did not bring forth any startling financial gifts or endowments, nevertheless the money supplied to public and private charities and corrections in the United States was estimated at \$500,000,000 for the year, four-fifths of which went to private volunteer activities. Following the devastation of Belgium there was in addition an outpouring of American wealth by private organizations, the Rockefeller Foundation, the American Red Cross, and the States. (See RED CROSS and RELIEF FOR WAR VICTIMS.) The great extent of unemployment in the winters of 1913-14 and 1914-15 also called for widespread emergency organizations and relief committees. (See UNEMPLOYMENT.)

The reader should also consult the following articles: CHILD LABOR; EUGENICS; JUVENILE COURTS; LABOR; MINIMUM WAGE; OCCUPATIONAL DISEASES; OLD-AGE PENSIONS; PENSIONS FOR MOTHERS; PENOLOGY; PROSTITUTION; SOCIAL ECONOMICS; SOCIAL INSURANCE; WOMEN IN INDUSTRY; and WORKMEN'S COMPENSATION. In few of these references will matter bearing on charity as poor relief be found, but the tendency is now very strong for prevention to take precedence of mere temporary relief, and hence those movements aiming to establish a more just social and industrial system are related to constructive philanthropy. Much attention is given to the determination of causes of dependency and delinquency as a first scientific step toward their final elimination. There is also a tendency for public supervision and control to increase on the grounds that haphazard relief may do more harm than good; that system and efficiency require governmental regulation, and that the interests of the State are paramount. The scope, aims, and problems of modern charitable undertakings are sufficiently indicated by the accounts of certain conferences.

NATIONAL CONFERENCE OF CHARITIES AND CORRECTIONS. This met at Memphis, Tenn., for its 41st annual session, May 6-15, under the presidency of Professor Graham Taylor of the Chicago School of Civics and Philanthropy. At the same time there met in Memphis, the Southern Sociological Congress (see SOCIOLOGICAL CONGRESS, SOUTHERN); the National Probation Association (see PENOLOGY); the National Conference on Education of Backward, Truant, Delinquent, and Dependent Children; the American National Red Cross, and certain societies described below. It was determined to hold the 1915 Conference at Baltimore, May 12-19, with Mrs. Mary Willcox Glenn as president. The following committees for 1915 were created with chairman as indicated: *Children*, C. C. Carstens of Massachusetts; *Corrections*, J. T. Gilmore of Toronto; *Public and Private Charities*, George S. Wilson, District of Columbia; *Family and Community*, R. M. Little, Pennsylvania; *State Care of Insane*, Dr. Walter E. Fernald of Massachusetts; *Education for Social Work*, Porter R. Lee of New York; *Health*, Dr. Richard C. Cabot of Massachusetts; *Social Legislation*, Professor Henry R. Seager of Columbia University; and *Social Hygiene*, Martha P. Falconer of Pennsylvania. Each of the main topics has several associated topics included with it. After much discussion in which considerable dissatisfaction with the method of selecting officers was shown, the president was authorized to appoint a committee to report at the next Conference, means of giving members a larger voice in such selections. Another committee was appointed to consider the advisability of changing the name to the National Conference of Social Betterment Agencies.

The 1914 conference had sessions on children; family and community; neighborhood; corrections (see PENOLOGY); defectives; standards of living and labor; public charities; social hygiene (see PROSTITUTION); and public health. President Taylor devoted his address to the problems of the country as a political and social unit. He found the inefficiency of county administration in the indifference of voters, the sway of partisan politics, the neglect of legislatures, the confusion and neglect of various governmental

agencies, and the lack of coöperation. He urged the necessity of humanizing politics, encouraging volunteer coöperation, and especially rehabilitating and revitalizing the country church.

In the session on Children, Dr. Francis Bradley of Atlanta recommended children's health conferences in connection with schools, charities and other organizations, as invaluable means of treating child hygiene. Mr. C. C. Carstens of Boston pointed out that the social and moral conditions of small towns and villages are often deplorable and hence social agencies must prepare to meet the special needs of the rural child. A paper on rescue agencies showed that these no longer seek merely to extricate the child from bad home conditions, but to elevate the entire home. Standards of efficiency in the care of children in institutions, in boarding houses, in free family houses, were discussed by several speakers. Opinion favored the boarding home, as opposed to the common practice of placing out all sorts of children in free homes in distant States where supervision is difficult. Roger N. Baldwin of St. Louis advocated a model children's code to include: establishment of eugenic conditions of birth; regulation of employment of mothers before and after child-birth; reporting of births; regulation of midwifery; relief of poor mothers; support of illegal children by fathers; compulsory education laws and a state-wide educational system; comprehensive juvenile court system; relief of destitute children; supervision of child-caring agencies. The conservation of child life by the promotion of hygiene, prevention of child labor, extension of school opportunities, and in the South by the organization of more social centres with teacher, preacher, and visiting nurse, was advocated.

The section on Family and Community considered charity organization work, the improvement of rural life, and the relation of business to philanthropy. Many phases of family rehabilitation were considered. One of several speakers on rural life was Booker T. Washington, who declared that seven million out of nine million southern negroes are on farms; they own twenty million acres, worth nearly one-half million dollars. The most important helps are better housing, regularity of pay, better schools, more police protection, methods to increase efficiency, and abstinence from liquor.

The section on Neighborhoods emphasized the large place recreation should occupy in country life, not merely as means of enjoyment, but as means of self-development, and increase of neighborly acquaintance, confidence, and coöperation. The fact was emphasized that the community and not the individual determines the kind of recreation and hence may send its youth to the saloon or to school social centres. The cheap candy store was considered a demoralizing agency leading to the pool-room, saloon, and sex immorality. Mr. Harry F. Ward emphasized the break-down of community life, the necessity of public provisions of recreation in the interest of better citizenship, and the evil and unwisdom of permitting play to be unconsidered.

The section on Defectives considered recent advances in science of mental hygiene. It was shown that newer methods of testing mental defects have resulted in special classes in public schools; have shown a large percentage of those in reformatories and prisons, especially juveniles, to be defective and therefore irresponsible,

incapable of reformation, and unfit to be given their freedom; and have given the courts a more intelligent basis for treating many cases. It was declared that epilepsy, insanity, and feeble-mindedness are closely connected factors in the treatment of delinquents. The colony plan of treatment, making possible separation of classes and gradation of cases, was accepted as best. Sterilization, already made legal in thirteen States and found unconstitutional in one, but constitutional in another, was shown to be little used and was believed to be largely impracticable in the present state of public opinion. Segregation is gaining rapidly in public approval. It was shown that the colony not only is not imprisonment for the imbecile and moron, but gives them largest possible freedom and happiness. The relation of venereal disease to some forms of insanity and alcohol as a direct and contributory cause of insanity were set forth. The use of the results of scientific studies of defectives and of trained psychologists by juvenile courts was described by Judge Adams of Cleveland. In Ohio every juvenile delinquent is first committed to the care of the State Board of Administration, which examines them, disposes of them individually, and then follows with its supervision. The combination of this with the New Jersey plan of special classes for defectives in public schools was advocated. It was believed that the time is ripe for a nation-wide campaign of education regarding the mentally defective.

In the section on Public Charities the following were declared to be the most pressing needs of the day: more adequate care of juvenile delinquents, special and better provision for the feeble-minded of both sexes, and more uniform laws for care of delinquent and dependent children.

The section on Standards of Living and Labor discussed protective standards for women and child workers; the work of the Oregon Industrial Welfare Commission; and the condition of mill children and messenger boys in the South. In discussing methods of maintaining standards, Secretary J. B. Andrews of the American Association of Labor Legislation described syndicalism as a sort of general discontent which gave expression to deep feelings of injustice, but as incapable of maintaining standards; collective bargaining protects gains of unions, sometimes at the expense of the general public, whereas the legislative method aims directly at just standards from the viewpoint of the worker, employer, and public. Mrs. Florence Kelley developed the necessity of more numerous local branches of the national associations represented at the conference and of greater coöperation and concentrated effort in advancing their common aims.

THE AMERICAN ASSOCIATION OF OFFICIALS OF CHARITY AND CORRECTION met at Memphis, May 4-5. This meeting was attended by members and officers of State boards of control, State boards of charity and correction, superintendents of institutions, and persons similarly connected with private institutions receiving State aid or under State supervision. They devoted themselves exclusively to topics of a very practical nature. In the 1914 session such topics were taken up as: kitchen organization and economy; organization of nursing service in a State hospital; poor relief; standard system of

accounting; pay-patient departments in a State hospital; State penal system; wage system for prisoners; and the need of a professional body of administrators and supervisors of State and private charities. President A. L. Bower of Illinois stated that the charitable, correctional, and penal institutions of the country have property valued at one and one-half billion dollars and spend three hundred million dollars per year in caring for nearly 500,000 inmates. Public institutions supported by taxes cost one hundred million dollars per year.

THE AMERICAN ASSOCIATION OF SOCIETIES FOR ORGANIZING CHARITY met at Memphis early in May. Many workers from the South and Southwest were in attendance. The relation of the negro, who constitutes from 20 per cent to 50 per cent of the population of every large southern city, to charity organizations was an important topic. The inherent weaknesses of independent negro charitable societies were shown to be lack of confidence in each other, church ambitions, and financial jealousies. It was shown that the Memphis plan of a negro auxiliary to the associated charities has the advantage of enlisting the financial and personal interest of negroes and at the same time eliminating weaknesses by securing sufficient outside control. Other topics included financing charity organization societies, and problems of family relief in unorganized communities.

The eighth biennial session of the NATIONAL CONFERENCE OF JEWISH CHARITIES met at Memphis, Tenn., May 6-8. Cyrus S. Sulzberger of New York in his presidential address discussed the lack of understanding between Jewish immigrants and native Americans, and mistakes of the latter in handling the former. The work of the Industrial Removal Office in New York, under the direction of David M. Bressler, in distributing Jewish immigrants according to opportunities for economic and social development, was discussed. A similar agency, the Galveston Bureau, carries on a like work in the South. The new problems due to the influx of thousands of immigrants from southeast Europe, the Levantine Jews, as distinct from the Russian, Galician, or German Jews, were analyzed. The committee on resolutions recommended that a survey of Oriental Jewish communities in the United States be made. The standing committee on Palestinian charities reported progress in organizing the collection of funds for Palestine. Effects of the Panama Canal on immigration were expected by various speakers to be much less than commonly anticipated. The work of the Free Loan Association and the Self-Respect Funds of New York was explained. Other topics were: free transportation for dependent individuals and families; standards of relief; settlement work; Hebrew free schools; and after-care of orphans.

OTHER CONFERENCES. The great extent and variety of charitable and philanthropic societies and movements is shown by the following partial list of meetings not here described. State conferences of charities and corrections were held in Arkansas, Colorado, Connecticut, Indiana, Iowa, Kansas, Maine, Maryland, Massachusetts, Minnesota, Missouri, New Jersey, New York, Ohio, Pennsylvania, Texas, Virginia, and Wisconsin. The 5th annual Child-Helping Conference of the Lehigh Valley, met at Allentown, Pa., May 9; National Federation of Remedial Loan

Associations, at Philadelphia, July 9-11; Canadian Association for the Prevention of Tuberculosis, at Halifax, Nova Scotia, July 13-14; American Public Health Association, at Jacksonville, Fla., November 30-December 5; American School Hygiene Association, at Philadelphia, September 22-29; American Hospital Association, at St. Paul, August 25-28; National Conference of Catholic Charities in conjunction with several other Catholic organizations, at Washington, September 20-23; American Federation of Catholic Societies, at Baltimore, September 27-30; American Institute of Criminal Law and Criminology, at Washington, October 20-22; American Humane Association, at Atlantic City, October 5-8; American Association for the Study and Prevention of Infant Mortality, at Boston, November 12-14; Seventh Triennial Council of Jewish Women, at New Orleans in December; American Prison Association, at St. Paul, October 3-8; National Housing Association, at Minneapolis, October 21-23; besides numerous conferences on rural life and problems, on education, sanitation, safety, and public service. International coöperation in study and exchange of ideas and methods was shown by the following: Third International Congress on the Welfare of the Child, at Washington, April 22-27; Fourth Triennial International Conference on the Blind, at London, June 18-24; International Congress for Children's Welfare, at Amsterdam, Holland; Third International Congress on Diseases of Occupation, at Vienna in September; International Association for Labor Legislation, at Berne, Switzerland, September 15-17; International Association on Unemployment, at Paris, September 18-19. See also PENOLOGY.

CHARITIES AND CORRECTION, NATIONAL CONFERENCE OF. See PROSTITUTION, under section entitled as above.

CHARLES I, King of Rumania, died Oct. 10, 1914. He was born in Sigmaringen, Germany, on April 20, 1839, the son of Prince Charles Anthony of Hohenzollern, head of the senior and Roman Catholic branch of the Hohenzollern. In March, 1866, he was chosen *hospodar* or prince of Rumania, which, comprising the principalities of Moldavia and Wallachia, was at the time little more than a misgoverned Turkish province. It still acknowledged the Turkish suzerainty. There was no army, the financial resources were precarious, and the condition of the people was wretched. Public affairs were in a condition bordering on anarchy. Prince Charles set about his task of governing the country with great energy, and his accomplishments were little short of marvelous. He created an army, introduced railways, and won independence for his kingdom. He also achieved military renown. In the Russo-Turkish War of 1877-78 he commanded the joint Russo-Rumanian forces and to his efforts was largely due the famous victory at Plevna. His most notable achievements, however, related to the building up of a national finance and trade. He extended the frontiers of the principality and raised it to the rank of a kingdom. He was not only the first recognized and independent sovereign of modern Rumania, but was in effect its creator. His position in the early days of his reign was not without difficulties. In 1871, when the French sympathies of his subjects exposed him as a German Prince and a Hohenzollern to great unpopularity, while failure of certain railway

schemes threw discredit upon his ideas of economic development, he summoned the members of the Provisional government from whom he had accepted the Crown and announced to them his decision to abdicate. He was, however, dissuaded from his purpose. On May 22, 1881, he was crowned King of Rumania, following the victory of Russia and Rumania in the Russo-Turkish War. Thenceforth his path was comparatively clear, although by no means easy. Following the Russo-Turkish War Russia deprived Rumania of her portion of Bessarabia and allotted in return the Dobrudja, a swampy region south of the Danube, as a compensation. There was great indignation in Rumania, and opposition became so strong that the Czar threatened to disarm the Rumanian army, a threat which drew from Prince Charles the reply, "The Rumanian army, which fought so gallantly before Plevna under the eyes of the Czar, may be annihilated, but will never be disarmed." He was, however, obliged to submit, and exerted himself to calm the national excitement. In November, 1869, he married Princess Elizabeth of Wied, who, under the name of Carmen Sylva, has gained a world-wide reputation as a writer and artist. King Charles's last year was saddened, and his end no doubt hastened by the outbreak of the great war in Europe. As a German and Hohenzollern he was reluctant to take hostile action against the German Emperor and the Emperor Francis Joseph. It was, moreover, stated that he was bound by his word of honor never to take the field against a Hohenzollern cause. Sympathies of the Rumanian people on the contrary were largely with the allies, and there was a strong sentiment in favor of participation in the war. See RUMANIA.

CHARLES FRANCIS JOSEPH, ARCHDUKE. Heir apparent to the throne of Austria-Hungary. He is the eldest son of the late Archduke Otto Francis Joseph, the younger brother of the Archduke Francis Ferdinand (q.v.). He was born in Persenberg on August 17, 1887, and on Oct. 21, 1911, was married to the Princess Zita of Bourbon of Parma, sister of the present Duke Henry of Parma. Charles Francis, up to the time of the death of Francis Ferdinand, was little known outside of Austria, but he is said to be extremely popular with the Austrian people.

CHARTER REFORM. See MUNICIPAL GOVERNMENT.

CHARTERS, MUNICIPAL. See MUNICIPAL GOVERNMENT.

CHAUTAUQUA INSTITUTION. The forty-first annual assembly of the Chautauqua Institution was held in July and August, 1914. There were courses in religious work, modern languages, mathematics and science, psychology and pedagogy, library training, music, arts and crafts, expression, physical education, mothercraft, and pre-European travel courses. Among the lecturers were Francis B. Gummere of Haverford College, President Lincoln Hulley of John B. Stetson University, Edward H. Griggs, and others. During the year *The Chautauquan*, the official organ of the institution, was merged with *The Independent*.

CHEESE. See DAIRYING.

CHEMICAL INDUSTRY. See CHEMISTRY, INDUSTRIAL.

CHEMICAL SOCIETIES. See CHEMISTRY, INDUSTRIAL.

CHEMISTRY. THEORETICAL AND PHYSICAL CHEMISTRY. Although the atomic weights of most of the elements are known with a considerable degree of certainty, redeterminations by new methods are always of value, for they may confirm the results previously obtained, and thus increase confidence in their accuracy, or, by failure to confirm them, may lead to search for possible sources of error and thereby to improvement in the methods applied. During 1914 redeterminations were published of the atomic weights of 15 elements, as follows: barium 137.36, cadmium 112.30, calcium 40.13, copper 63.55, helium 4.002, iridium 193.42, lutecium 175.00, mercury 200.37, neon 20.0, scandium 44.6, selenium 79.14 and 79.16, tellurium 127.5 and 127.6, vanadium 50.96, ytterbium 173.00 and 173.50, and yttrium 88.79; as well as of the silver-sulphur-chlorine ratios, and a study of the purity of lithium perchlorate, on which the accepted value for silver is based. It is remarkable that in no case are the results sufficiently different from the accepted values for changes to be made in the table of international atomic weights, although it appears probable that the values for helium and ytterbium are somewhat low, and those for neon, silver, and yttrium high.

Perhaps the most important piece of work in this field was the demonstration by Prof. T. W. Richards and Max E. Lemberg at Harvard University that lead obtained from different sources has different atomic weights. Samples of lead from the more important radio-active minerals and of commercial lead were purified by the elaborate methods which have made the Harvard laboratory famous, and in a series of parallel experiments the atomic weights were determined by the method of precipitation of the chloride by silver nitrate. The results obtained were directly contrary to previous experience, for similar work on samples of copper, silver, sodium, and chlorine from widely different sources, and most interesting of all, on iron of terrestrial and meteoric origin, had always shown the atomic weight of each element to be constant, no matter what its source. Lead from five different radio-active minerals gave atomic weights varying from 206.40 to 206.86, while the value obtained for ordinary lead, derived from sulphide ores, was, in exact agreement with previous determinations, 207.15. It may be noted that the spectra of all the specimens of lead were identical. These differences are entirely too great to be due to errors in manipulation, and it may be concluded that the lead of radio-active origin contains one or more components of lower atomic weight, which are so similar to ordinary lead in chemical properties that the means of purification applied failed to remove them. It is especially interesting to note that this phenomenon had previously been predicted as a necessary result of the disintegration theories of radio-activity.

While no epoch-making discoveries in the field of radio-active phenomena have been announced during the year, much work has been done, and previous views as to the constitution of the atom placed on a firmer basis. As summed up by Eve at the meeting of the Royal Society of Canada in May, 1914, the atom is to be regarded as a sort of miniature solar system. The sun is replaced by a positively charged nucleus. The planets, perhaps confined to one or more definite orbits or rings, are replaced by negative elec-

trons revolving rapidly around the nucleus, and the gravitational force is replaced by the electrical attraction between the positive nucleus and the negative electrons.

Certain work of the United States Bureau of Mines on radium deserves mention. According to the modern views of the nature of radioactive transformations, the ratio of radium to uranium in minerals should be constant. A number of apparent exceptions to this rule, especially among secondary minerals, have been found from time to time. The importance of carnotite as a source of radium led Lind and Whittemore of that bureau to make an elaborate investigation of the ratio in this mineral. Samples from small lots of carnotite were found to exhibit abnormal ratios, both high and low, but samples representing hundreds of pounds or tons gave a radium-uranium ratio identical with that of the standard, pitchblende. The most plausible explanation for these results is that radium has been transposed in the ore deposit, leached out in some places and concentrated in others, producing local differences which are equalized by mixing large quantities of ore. The Bureau of Mines also announced that a new method for the extraction of radium from its ores has been worked out, which is expected to result in a considerable lowering of the cost of its production.

The application of the Roentgen or X-rays to the study of atomic and molecular structures has been actively advanced during the year. Moseley has extended his studies of high-frequency spectra to a large number of elements, with highly interesting results. The method consists in subjecting the substances to bombardment in a cathode tube, analyzing the X-rays emitted by them with a crystal plate, and photographing the resulting spectrum bands. For each band $n = A(N-B)^2$, where A and B are constants, n the nucleus electronic charge, and N the atomic number. Assuming N to be 13 for aluminium, that for gold, the last examined, is 79, known elements corresponding to all but three of the numbers between, and the order of the atomic numbers coinciding more exactly than the order of the atomic weights with the periodicity of chemical properties. The atomic number is a more fundamental property of an element than the atomic weight, for it depends on the number of positive units of electricity contained in the atomic nucleus.

The application of the X-rays to the determination of the molecular structure of crystals has received further attention, especially from W. H. and W. L. Bragg. That the grouping of the atoms rather than of hypothetical physical molecules is responsible for the properties of crystals has now been certainly demonstrated, and Groth has pointed out that this had been previously predicted by crystallographic studies. It may now be accepted that molecules exist only in amorphous substances, that is, in gases, liquids, and colloids, while crystals consist of interpenetrating point-systems of atoms. The structure of the crystals of diamond, sulphur, copper, sphalerite, calcite, fluorite, pyrite, and quartz have been worked out by the Braggs.

INORGANIC CHEMISTRY. Several instances of allotropy in the elements have been discovered, the most noteworthy work being that done by Bridgman on phosphorus. By subjecting the ordinary yellow form of this element to extremely high pressures there was produced at low tem-

peratures a yellow hexagonal modification, and at 220° a black one with high density, fair electrical conductivity, and other marked differences from previously known forms.

A number of new compounds have been prepared, chiefly salts of the rarer metals with less common acids, but including a series in which the usually bivalent metal nickel appears to be univalent. Studies of the rare earths, especially of terbium and the constituents of the old ytterbium, both as to properties of their compounds and means for their separation, have been carried on by several investigators. Work on the complexes of cobalt, chromium, and similar metals was continued by Werner and his students and several cases of optical activity of compounds containing asymmetric atoms of these elements discovered.

Mention should be made of the work of the Geophysical Laboratory of the Carnegie Institution of Washington on mineral synthesis. In addition to the working out of the phase relations of several rock-making silicates, a particularly elaborate study was made by Allen, Crenshaw, and Merwin on the two dimorphous groups, pyrite-marcasite (FeS_2) and sphalerite-wurtzite (ZnS). It was shown that the unstable forms, the second in each case, tend to develop in the presence of excess of acid and at elevated temperatures.

ORGANIC AND BIOLOGICAL CHEMISTRY. Work in organic chemistry has been directed, as in previous years, chiefly toward the synthesis of new compounds. Many of those prepared were of only theoretical importance, but others, such as the dyes, were of actual commercial value. The brilliant work of Emil Fischer on the synthesis of complex organic substances has been extended to the glucosides and tannins, with a considerable degree of success. A few studies of the coloring matters, essential oils, and active principles of various vegetable and animal products were made during the year, among which may be mentioned Willstätter's work on the presence of chlorophyll in brown algae, and on the anthocyanins, a group of coloring matters of flowers and fruits, which were shown to be vegetable bases, in which the basic properties are due to oxonium oxygen in quinoid combination; and the work of various chemists on the composition of bile pigments, and on the constituents of urine.

Investigations which may prove to have great importance to the human race are those of Mendel and Osborne on the effect of various proteins on the maintenance and growth of the animal organism, and of Funk on the vitamins, nitrogenous compounds present in certain vegetable tissues and their bearing on nutrition. The vitamins of grains occur chiefly in the bran, and are largely removed in modern processes of milling. The greater wholesomeness of whole-grain products, in which the vitamins remain, is thus evidently connected with the important part played by these substances in the metabolism of carbohydrates.

ANALYTICAL CHEMISTRY. Research in this department has been devoted principally to the improvement of existing methods with respect to their accuracy and rapidity. The introduction of new materials in commercial channels is always followed by the publication of methods for the analysis of these substances or their constituents. The appearance of articles on the de-

termination of chromium, nickel, titanium, tungsten, and vanadium in steels and ores, of potassium and phosphoric acid in fertilizers, and of the various constituents of aluminium alloys, bronzes, and glasses, is a good index of the direction in which industrial development is taking place. See CHEMISTRY, INDUSTRIAL; PHYSICS.

CHEMISTRY, INDUSTRIAL. (See also CHEMISTRY.) Two conspicuous events have exerted an important influence on the progress of Industrial Chemistry during the past year. The first of these was the change in the tariff on sugar, resulting in a diminished output of cane sugar from Louisiana and also of beet sugar in various parts of the United States, with a corresponding financial loss to those connected with these industries. The second was the war in Europe, which stopped the shipping of chemicals and dyestuffs from Germany, not only to the United States but also to other English-speaking countries. Whether this condition would result in the development of new industries at home was a question that only the future could answer.

ORGANIZATIONS. *The American Chemical Society* held its spring meeting in Cincinnati, Ohio, during April 7-10, and had planned for a meeting to be held in Montreal, Canada, during the autumn, but this was abandoned owing to the war in Europe. The membership of this great society had increased to over 7000. The president during the year was Theodore W. Richards, of Harvard University, who was succeeded by Charles H. Herty, of the University of North Carolina.

The American Institute of Chemical Engineers held its summer meeting in Troy, N. Y., during June 17-20, and its annual meeting in Philadelphia, Pa., during December 2-6. Its membership is 214. The president during the year was M. C. Whitaker, of Columbia University, who was succeeded by George D. Rosengarten, of Philadelphia, Pa.

The Society of Chemical Industry held its thirty-third annual meeting in University College, Nottingham, England, during July 15-17, 1914, under the acting presidency of Dr. Rudolph Messel, who filled the chair owing to the fact that Sir William Crookes was obliged to relinquish the office when he was chosen to the presidency of the Royal Society. The secretary reported the membership to be 4142 as compared with 4244 last year. G. G. Henderson, professor of chemistry in the Royal Technical College of Glasgow, Scotland, was chosen president for the coming year and Manchester, England, as the next place of meeting.

The preliminary announcement of the Ninth International Congress of Applied Chemistry was distributed. The Congress was announced to be held in Petrograd, Russia, during Aug. 1-14, 1915, under the presidency of P. I. Walden of the Polytechnical School in Riga.

MEDALS. On January 23, the W. H. Perkin medal was awarded to John Wesley Hyatt for his invention of celluloid and his development of the industry connected with that compound. The W. H. Nichols medal of the American Chemical Society was on March 6 conferred on Moses Gomberg, professor of organic chemistry at the University of Michigan for his researches on tri-phenylmethyl, resulting in the discovery of the existence of carbon in the trivalent state. The Willard Gibbs medal of the Chicago section of the American Chemical Society was on May

15 given to Ira Remsen, president emeritus of Johns Hopkins University, for his many achievements in chemistry. The first award of the Charles Frederick Chandler medal of Columbia University was made, on May 29, to Dr. Leo H. Baekeland, who delivered the lecture on that occasion on "Some Aspects of Industrial Chemistry." The medal of the Society of Chemical Industry was on July 15 conferred on Sir Henry E. Roscoe for his eminent service to chemistry.

METALS. *Aluminum.* Aluminum foil is finding increasing use as a substitute for tin foil, especially for wrapping confectionery, tobacco, etc., and has the advantage of being lighter and more durable than the tin foil. It is made in Switzerland by painting sheets of pure aluminum with a solution of oil that is soluble in water, placing the sheets one upon another, or folding them, and then rolling them out to double their length in a rolling mill, then folding the sheets and rolling out again and repeating until the desired thinness is obtained. The cylinders of the rolling mill are warmed with water to 113° F. The sheets are rolled cold and finally annealed in a vacuum retort, then cooled gradually.

Mercury. A growing use is the coating of ships' bottoms with a paint containing mercury to prevent organic growth. Mercuric oxide is the active poison in antifouling paint successfully used on ships' bottoms. The metal appears to be now but little employed in making mirrors, as silver nitrate is now chiefly used. Increasing use of mercury is to be expected in the manufacture of electrical appliances and of fulminates, and possibly of paints for protective coatings on metals. The demand for mercury for amalgamating gold and silver has greatly decreased with the decreased supply of free milling ores and the increased application of cyanidation to gold and silver ores.

Platinum. After the discovery of this valuable metal in Westphalia it was reported that the amount of platinum present in the rock varies from 0.9 to 1.9 troy ounces to the cubic yard which is very rich as compared with the Russian deposits. A plant was established at Wenden, Westphalia, for the extraction of the platinum on a large scale. It is found in the form of an alloy and after being brought into solution is extracted as the nitrate.

Tin. The amount of tin available is so comparatively small that anything pertaining to its supply is of interest. From the Malay Peninsula where its mining is one of the most important industries came the announcement that mining methods are undergoing a gradual change by the introduction of the dredging system, and it was predicted that in two years the price of tin would reach a level considerably lower than the average of the previous two years. Nineteen dredges were placed on various properties in Malaya and Siam. It was said that some of the dredges were producing 600 piculs (40 short tons), and other methods were being pursued, including hydraulicking, lode mining, and calambashing. All this signified a greater output. Bolivia was reported too to be showing excellent development work and on the whole was systematically prosecuting the industry. The market therefore not only would have to bear an increased output from Malaya, but also from Nigeria and Bolivia.

The recovery of tin from tin-plate waste by

1914 had gained great importance. There were three general methods of separation—mechanical, chemical, and electrolytic,—but of these the most important was the electrolytic method of detinning. As a rule, hot liquid caustic soda was employed as electrolyte. Loosened chips of tin plate packed in wire baskets act as anodes, while the iron bath walls or iron plates suspended therein serve as cathodes. When separated, the tin is spongyform. By far the greatest amount of tin-plate waste in 1914 was being detinned by the chloride method that Lambotte, of Brussels, was the first to apply on a large scale. The principal requirements for a successful application of this method were absolute exclusion of moisture during the process of detinning, avoidance of an unduly high temperature, and proper washing of the detinned waste.

Radium. The existence of pitchblende and uranium ochre containing radium was reported from the Gaya district in Northeastern India. The pitchblende occurs as rounded nodules distributed throughout certain basic segregations, several feet in diameter, in pegmatite. In these basic segregations the following minerals occur, but not always together: White and yellow mica, triplite, ilmenite, tourmaline, pitchblende, and uranium ochre; while columbite, zircon, and torbernite also were recorded. Rewards (of \$25,000 in Ontario and \$5000 in British Columbia) were offered in Canada to the first person who discovers radium in sufficient quantity for commercial extraction. The Chamber of Mines in Vancouver, British Columbia, undertook the founding of a public radium institute in that city.

A new method for controlling smelter smoke was announced from California. The process was secret, but runs of a small plant were made on sulphide ore from the Balaklala mine, averaging about 45 per cent sulphur, and the experimenters say that every vestige of the mineral was removed from the smoke fumes.

The **METHANOMETER**, or Williams Fire-Damp Indicator, was a new detector of the hydrocarbon fire-damp, a gas responsible for many explosions in coal mines. The apparatus is made in two parts; one, an instrument which is very sensitive and responds quickly when fire-damp is present; the other, a dial indicator which shows the exact percentage of methane in the atmosphere. The detector and indicator may be placed side by side, enabling the miners to know by what percentage of fire-damp they are surrounded, or the indicator may be placed at any convenient centre. The connection between detector and indicator is electric.

ARTIFICIAL DIAMONDS. There was published in Paris early in the year an account of the manufacture of artificial diamonds by decomposing calcium carbide in an electric furnace. The details are as follows: The furnace was fitted with two horizontal electrodes, which were carbon rods approaching one another within 10 inches. It was charged with calcium carbide, fused by the continuous currents applied. At the end of 12 hours the carbide was found to be enriched with fine crystals near the anode. In the space between the two electrodes the carbide was left undecomposed. The cathode, however, was surrounded by a black mass, from which some flakes of graphite and also some colorless, mostly irregular, crystals or globules

were isolated, which consisted of pure carbon. When the furnace had been run for six hours, the length of these crystals was $\frac{1}{17}$ inch, the length increased with longer runs, and crystals of $\frac{1}{10}$ inch were obtained by the run of 12 hours; the rate of growth was generally $\frac{1}{125}$ inch an hour.

INFUSORIAL EARTH. Infusorial earth was being mined actively in California and Nevada and was finding new uses. Its porosity renders it a nonconductor of heat, and this quality in connection with its lightness has extended its use as an insulating packing material for safes, steam pipes, and boilers, and as a fireproof building material. In the United States a new use was reported in the manufacture of records for talking machines. For this purpose it is boiled with shellac, and the resulting product has the necessary hardness to give good results. In Europe, infusorial earth has been used in preparing artificial fertilizers, especially in the absorption of liquid manures; in the manufacture of water glass, of various cements, of glazing for tiles, of artificial stone, of ultramarine and various pigments, of aniline and alizarine colors, of paper, sealing wax, fireworks, gutta-percha objects, Swedish matches, solidified bromide, scouring powders, papier-mâché, and other articles.

CHLORINE. "Liquid chlorin" is the name under which liquefied chlorine gas appears in commerce. During recent years the manufacture of liquid chlorine has become well established in the United States and the product was said to be displacing bleaching powder in a number of industries. It was also being used in chemical industries such as detinning. The gas is generated by the electrolysis of salt brine and is then dried, compressed, and cooled until it liquefies. It is marketed in steel cylinders having a capacity of from 100 to 110 pounds weight. The results obtained by the calcium hypochlorite process in emergency water sterilization have led to experiments with liquid chlorine for the same purpose. Excellent results as to bacterial efficiency were obtained.

MILK. A new pasteurizing process was described as follows: After being tested for acidity and butter fat the milk is first passed through a fine sieve and then heated. This is to facilitate its passage through the clarifier, which removes all impurities. It is then pasteurized at a temperature of from 155 to 165 degrees which arrests the development of the acid in the milk and destroys the bacteria. The milk then passes into the "homogenizer" where it is forced under a pressure of 3500 pounds through tiny tubes into an agate and bronze device, which grinds each separate globule of butter fat into fine particles and makes the liquid of the same consistency throughout. It is then ready for cooling and bottling or canning. The sterilizing is done after the fluid has been sealed.

A new process for making dry milk came from Stavanger and was described as follows: The process is mechanical and is not based on previous vacuum, pressure, or spray systems. The apparatus consists of a drying chamber built of bricks, insulated wood, and metal lining, within which is passed an endless traveling steel band about 20 inches in width. Through the top of the drying chamber a vessel is inserted, wherein the milk is vaporized before supplying it to the

band for final drying. In this vessel the vaporization rids the milk of two-thirds to three-fourths of its original content of water. A revolving cylinder, dipping into a cup of the partly vaporized milk, conveys the liquid to the slowly moving metal band, the milk film being thus passed into the drying chamber where it is subjected to superheated circulating air, and when scraped off from the band by a keen-edged knife contains only 2 to 5 per cent of water. The degree of desiccation may be regulated by controlling the temperature of the heated air, and, to some extent, by varying the velocity of the steel band. Dry milk, sometimes called evaporated milk or milk meal, must not be confused with condensed milk, for the two are produced by entirely different processes. Dry milk is used in connection with products of the bakery, being employed to advantage as an ingredient in ice cream, bread, biscuits, and chocolate. It is coming to be used on ships, expeditions, and explorations, where convenience of transportation and keeping qualities are important.

PALM SUGAR. The palmyra palm is one of 16 varieties of palms growing in Ceylon from which sugar may be extracted. It is the principal palm grown in the northern part of the island, especially in the neighborhood of Jaffna, but is rare about Colombo and in the upcountry. A company was organized in Colombo to manufacture and refine sugar, and its intention was to develop the production of sugar in Ceylon, which hitherto had imported nearly all that it used from Java.

EXPLOSIVES. Trotoil gelatin was a new explosive invented by Lieut. Harold C. Woodward which is referred to as the "War Department's newest, safest, and most powerful explosive." Its composition was secret, but it was described as not freezing or sweating, that it was impervious to weather conditions and shock, and that it could be hammered without destroying its power or setting it off. It is twice as powerful as 80 per cent dynamite. Trotoil gelatin is not a pushing force like gunpowder, but has a shattering force, and is therefore well adapted for demolition work.

Sabulite is a recent explosive which it is claimed is two-thirds more powerful than dynamite. The chief feature of sabulite is that it can be handled without danger both while in course of manufacture and in use. None of the ingredients is in itself explosive. Sabulite is not affected by heat or cold. It has been subjected to a temperature of 258 degrees Fahrenheit and 75 degrees below zero without its properties being affected. Another salient point about this explosive is that no poisonous fumes are given off in the explosion. Sabulite is used for blasting purposes only.

The United States Bureau of Mines found that the total production in the United States of explosives according to figures received from manufacturers was in 1913 463,514,881 pounds (231,757 short tons), as compared with 489,393,131 pounds (244,966 short tons) for 1912. This production was segregated as follows: black powder 194,146,747 pounds; "high" explosives other than permissible explosives, 241,682,364 pounds; and permissible explosives 27,685,770 pounds. These figures represented a decrease of 36,146,622 pounds of black powder, and an increase of 7,212,872 pounds of high

explosives and 3,055,500 pounds of permissible explosives.

RUBBER. The guayule shrub in Mexico and Southwestern Texas was found a profitable source of rubber, the extraction being by crushing and a simple chemical process through which the shrub is put. It was decided to apply this method to the bulia tree which is very abundant in the Fiji Islands, and it proved so successful that efforts were at once taken to exploit the industry. An enormous tonnage of the trees can be grown upon a small tract of land where they are planted and cultivated. There are enough wild trees, however, to provide a supply for years to come. Owing to the fact that the Fiji Islands are of small area and are supplied with shipping facilities, the bulia trees are convenient to transportation. The bulia tree is of very rapid growth. It attains a size of 8 to 10 feet in one year. Experts who have analyzed the bulia rubber report that it is of as high quality as the best Para product.

A modified variety of rubber sponge known as "rubber foam," suitable for pneumatic tires, was produced in Paris by an ingenious process. The product consisted essentially of india-rubber containing numerous minute bubbles of gas distributed throughout its mass. The material resembles a rubber sponge in which the cavities are separate and do not communicate with each other. Hence the name "caoutchouc mousse," or rubber foam. The process of manufacture is based on the increase of solubility of gases with increase of pressure. Rubber in the pasty stage of vulcanization is inclosed in a steel tube with nitrogen at a pressure of 3000 to 4000 atmospheres. The compressed gas dissolves in the semiliquid rubber, which, when the tube is opened, expands to four or five times its former volume and solidifies, imprisoning in its mass myriads of little gas bubbles. The product combines the properties of its two ingredients. It is as flexible as rubber and as compressible as a gas, so that it may be employed in the place of the air tube of an automobile or bicycle tire. A tire so constructed is noncollapsible, for a puncture affects only a few of the innumerable gas bubbles. Another valuable property of rubber foam is its lightness. Its density varies from 0.4 to 0.17, according to the quantity of gas forced into it. Hence, it is an excellent material for life preservers and small folding life rafts.

ARTIFICIAL WOOD. A new product that may be substituted for natural wood was invented in France. It is made by transforming straw into a solid material having the resistance of oak. The straw after being cut into small pieces is reduced by boiling to a paste, to which chemicals are added. When the paste has been reduced to a homogeneous mass it is put under presses, and planks, beams, laths, and moldings of all sizes are readily made. This new material can be sawed like natural wood. As a fuel it emits a bright flame and little smoke. It is said to be adaptable to the manufacture of match stems.

A NEW FIBRE. The spread of the water hyacinth (*Eichornia crassipes*) in the waters of Cambodia and other portions of Indo-China led to experiments with the plant as a fibre producer. It is possible to extract the fibre from the stalk by means of a Ducheman machine and after drying, preferably by gradual process, it

can be made into rope and twine as well as coarse thread suitable for matting and sail-cloth, and its use in Indo-China particularly is possible in bags for rice and other grain exports in place of the jute bags now imported. On a native loom it affords a strong flexible cloth of about the same quality as jute. The fibre takes dyes readily and has high tenacity. Its weight is about the same as that of jute, but can be reduced by treatment with chrome alum, which makes the product waterproof.

LUMINOUS INK. Luminous paint has existed for some time, and match holders, clock faces, and similar things that are lost in the dark have been coated with it. A German chemist produced a luminous compound, cheap enough to use for printing ink, which will make the type of a newspaper visible in the dark. It is claimed the compound will remain luminous for 10 years. At the same time that the luminous ink had been announced there was a French patent issued to a chemist for a bleachable ink that would enable old newspapers to be repulped for news print paper.

NEW TRANSPARENT FABRIC. Cellophane, a new product invented in Paris, has the properties of a flexible fabric and is at the same time transparent. It is a cellulosic sodium xanthate which looks like a sheet of paper, but is as transparent as glass, very tough, insoluble in water, impermeable to greasy substances, unattackable by ethers, alcohols, and alkalis. Biophane has the same qualities, but is thicker; it is to cellophane what cardboard is to paper, and it costs less, weight for weight. Perfumery uses cellophane as a wrapping for its products, and biophane serves in the manufacture of transparent boxes that, while they are as strong as the ordinary kind, allow the contents to be seen. Compressible tubes may also be made of it instead of the more expensive tin. Medicine employs cellophane in numerous ways, owing to its valuable quality of being easily sterilized, either by steam, which it will stand up to 150° C., or by boiling water, alcohol, hydrogen dioxide, formol, or lysol. It is also very serviceable in the preservation of objects wrapped in it, particularly dressings. Sterilization is effected at 145°, and the enclosed object remains perfectly sterile, owing to the peculiar properties of the cellophane.

A NEW ANTISEPTIC. A new antiseptic that is of value in the treatment of typhoid fever, dysentery, cholera, and other diseases arising from the presence of bacteria in the intestinal tract is giving excellent results. It consists of a solution of sodium sulphate, to which has been added a quantity of trimethyl-methoxyphenol in the form of a gelatin emulsion.

EFFECT OF THE WAR IN EUROPE. The effect of the war in Europe has been to stop the importations into the United States from Germany and Austria-Hungary of raw materials and chemicals that are so largely used in industrial chemistry. It was hoped that in some instances this condition would tend to improve existing industries in America by the establishment of new plants, and the bureaus of the United States Department of the Interior have made careful investigations with a view of ascertaining the existence of deposits of raw materials and their development. Three industries were specially affected, that is, the fertilizer, the dyeing, and the chemical industries. For

the maintenance of agriculture mineral fertilizers are essential, and these contain large quantities of potassium salts, which had been imported from Germany. There are deposits of these salts in California and efforts were being made to develop them for our own consumption. Secretary Lane announced in September that the first American potash would be produced by a plant in Searles, Cal., before the beginning of 1915, and the output that at first would be five tons a day would soon be increased to 120 tons. Deposits of phosphates are abundant in the Southern States and the announcement was made that there were 3,000,000 acres of phosphate land in Western States lying near smelters from which is produced the sulphuric acid necessary to convert these phosphates into soluble forms available for plant food. Sodium nitrate (Chile saltpetre) comes almost entirely from the west coast of South America and two-thirds of the output from that region has been exported to Europe, but owing to inability to obtain money from foreign bankers many of the works have been shut down. A large quantity of the artificial dyestuffs used in the United States comes from abroad, and for the year ending June 30, 1914, the imports of these products from Germany alone amounted to \$7,940,061. There was hope that this quantity might be produced by American manufacturers whose aniline dyes are said to be fully equal to the German. The output of this material in 1909 in the United States had a value of \$16,428,676, but manufacturers claimed that they cannot be expected "to build up the dye industry without an increase in the tariff." From England it was reported that for all orders received after Dec. 1, 1914, the prices of materials dyed black would be increased by 10 per cent and colored materials would be advanced 20 per cent. Certain materials such as antimony and manganese used in the steel industry had been imported, but deposits in the United States were to be developed for these metals. Kaolin, of which 85 per cent had been imported for the use of potters, was in 1914 being mined in Southern California. Talc, which is also used in making pottery and finds a demand as a filler in making paper, had been imported from France and Italy, but since the supply was cut off from abroad it was reported that a large deposit of this mineral of great purity had been discovered near Silver Lake in California. Deposits of raw materials, hitherto not available owing perhaps to the high cost of transportation, were likely to be developed, and chemical products, including drugs, were likely to be manufactured in the United States in larger quantities than formerly, provided satisfactory tariff conditions could be had.

LITERATURE. A series of *Bulletins*, showing the value of certain descriptions of merchandise exported from Germany, Austria-Hungary, and Great Britain to all destinations in a recent year, were issued by the Board of Trade in London. The following pertain to industrial chemistry: Cement, Fertilizers, Fire-proof Bricks, etc., Heavy Chemicals, Hollow Glassware, Medicines, Lubricating Oils, Painters' Colors and Varnishes, Perfumes and Cosmetics, Photographic Goods, Scientific Instruments (except electrical), and Soaps.

CHESS. The European War interrupted the international chess tournament which opened at

Mannheim, Germany, in July. With the competition about two-thirds finished the prizes were distributed according to the standing of the players when the halt was called. The year was notable, however, because of the meeting of Dr. Lasker and J. R. Capablanca at the championship tourney held in St. Petersburg. The Cuban champion gained an early lead but eventually was overhauled and beaten. Rudolph Spielmann won the Gambit tourney at Baden, thereby stamping himself as one of the most proficient players in the world at this particular style of the game.

The twenty-second American intercollegiate tournament was won by Yale after a play-off with Columbia. Pennsylvania carried off the laurels in the triangular college matches. Cornell was second and Brown third. In the Western intercollegiate tourney the University of Chicago and Armour Institute tied for first place.

Several notable contributions to the literature of the game were made during the year. These include a handbook by Carl Schlechter of Vienna; *Chess Swindles* by F. J. Marshall, champion of the United States, and *Rice Gambit* by O. Duras of Prague.

CHICAGO, UNIVERSITY OF. A university for higher education, founded in Chicago, Ill., in 1892. The number of students enrolled in the autumn of 1914 was 3888, and the faculty numbered 274. There were no notable changes in the faculty during the year and no noteworthy benefactions were received. The productive funds of the university amount to \$18,598,275, and the income from all sources to \$910,496. The library contains 431,362 volumes. The president is Harry Pratt Judson.

CHICAGO, ROCK ISLAND, AND PACIFIC SITUATION. See RAILWAYS.

CHILD LABOR. Perhaps the most important development during the year in the child labor problem was the greater recognition given by the Federal government. The Children's Bureau of the Department of Labor rendered its first report, and the Palmer Bill was introduced into the House, receiving the unanimous approval of the committee. In essence, the bill provides a 16-year age limit for the employment of children in mines, a 14-year limit in factories, and 18 years for night work or for more than eight hours per day. Moreover the bill would prevent the sending or the offering for shipment in interstate commerce of the products of manufacturing or mining establishments where child labor is employed in violation of these standards. It thus went farther than previous bills which merely prohibited the actual shipment of goods in whose manufacture child labor had been employed. Another fact of importance was the decision in Massachusetts to continue the eight-hour law for children in spite of numerous and powerful protestations. There are now seven States, namely, Alabama, Nevada, New Mexico, North Carolina, South Carolina, Utah, and Wyoming, which have no 14-year limit, while Mississippi still has none for boys.

NATIONAL CHILD LABOR CONFERENCE. The tenth annual conference on child labor was held under the auspices of National Child Labor Committee at New Orleans during March. "Child Labor and Law Enforcement" was the general topic discussed. It was pointed out in this connection that in several of the Southern

States the law was often very laxly, and sometimes not at all, enforced. In North Carolina, for example, Dr. McKelway stated that it was hardly possible to get juries in the cotton mill countries to bring in a true bill against violations of the law. Inability to pass child labor statutes in the South was ascribed to the recent development of the textile industries there, and the fact that but half a century has elapsed since the abolition of slavery. Among the other topics considered were: the need of a constructive appeal; the menace of child labor; the enlightenment of the public; the child on the street; the difficulty of securing child labor legislation in the South; the place of woman in the carrying out of the law, and many kindred subjects. The reports from several State committees showed advances in nearly every case. A resolution was passed expressing regret at the act of Maryland in reducing the age limit for workers in the canneries.

LEGISLATION. Of the 14 States holding legislative sessions in the year all took some action on child labor, either favorable or adverse; and no fewer than five enacted entirely new codes. All of the latter were steps in advance and sought to reduce hours, to prohibit night work, and to raise the minimum age for employment especially in the hazardous occupations. The first child labor law ever secured by popular initiative was that enacted by Arkansas in September, after the legislature had voted a similar bill down. This is based on the Uniform Child Labor Law and establishes a 14-year-old limit, the eight-hour day, and other provisions of the model statute, besides granting the State board of health the power to extend the list of dangerous or unhealthful trades prohibited to children. Kentucky, New Jersey, and New York were the only other States to make the eight-hour law a part of their code; but Mississippi, on the other hand, amended her provisions on this matter by lowering her requirement. Efforts were made to repeal this law in Massachusetts and Ohio, but were unsuccessful. The 14-year limit was extended by Georgia, Kentucky, Louisiana, and New Jersey, while South Carolina defeated a bill to establish it. A backward step was taken in Maryland, when the eight-hour law was amended so as to apply only to boys under 14, and girls under 16, the ages formerly being 16 and 18 respectively.

CHILE. A South American republic, on the Pacific coast. The capital is Santiago.

AREA AND POPULATION. The republic extends from Peru to the southern limits of South America, about 4230 kilometers. The width varies, but may be stated as approximately 285 kilometers. The country is divided into 23 provinces and one territory. The area, as officially stated, and the population, as calculated for the end of 1911, are shown in the following table; the last column gives the provincial capitals:

Provinces	Sq. km.	Pop.	Capitals
Aconcagua	14,210	134,136	San Felipe
Antofagasta	120,718	120,522	Antofagasta
Arauco	8,866	62,495	Lebu
Atacama	79,585	65,495	Copiapó
Bío-Bío	13,587	101,329	Los Angeles
Cautín	15,105	164,396	Temuco
Chiloé	22,255	92,665	Ancud
Colchagua	9,987	159,548	San Fernando
Concepción	8,422	227,732	Concepción
Coquimbo	34,862	179,982	La Serena
Curicó	7,714	108,455	Curicó
Linares	10,210	112,566	Linares
Llanquihue	91,676	116,094	Puerto Montt
Magallanes (Ter.)	171,438	24,009	Punta Arenas
Malleco	7,701	114,098	Angol
Maule	6,410	117,324	Cauquenes
Nuble	8,823	171,047	Chillán
O'Higgins	6,066	94,888	Rancagua
Santiago	14,672	556,601	Santiago
Tacna	28,958	48,654	Tacna
Talca	9,948	182,982	Talca
Tarapacá	46,957	117,922	Iquique
Valdivia	21,637	136,441	Valdivia
Valparaíso	5,059	305,875	Valparaíso

Chile *757,366 3,459,951 Santiago

* 292,366 square miles.

The population of Santiago is estimated at about 400,000 and of Valparaíso about 200,000. The 1907 census returned the population of the larger cities and towns as follows: Santiago, 332,724; Valparaíso, 162,447; Concepción, 55,330; Iquique, 40,171; Talca, 38,040; Chillán, 34,269; Antofagasta, 32,496; Viña del Mar, 26,262; Curicó, 17,573; Temuco, 16,037; La Serena, 15,996; Talcahuano, 15,561; Valdivia, 15,229; Punta Arenas, 12,199; Coquimbo, 12,106; Los Angeles, 11,691. Marriages, as reported for 1912 and 1913, numbered 21,298 and 21,341; births, 135,255 and 139,974; deaths, 104,295 and 111,255; excess of births over deaths, 30,960 and 28,619. The government encourages immigration, offering facilities for the transportation of workingmen desiring to settle in Chile; nevertheless immigration declined from 6024 in 1908 to 3098 in 1909 and 2543 in 1910.

EDUCATION. Primary instruction is free, but not compulsory; there is a low average attendance at the public schools. The State religion is Roman Catholicism, but religious toleration prevails.

PRODUCTION. The area under cultivation in 1911-12 was 1,233,663 hectares, or 1.62 per cent of the area of the country. Of the cultivated area, 584,264 hectares, or 47.4 per cent, were planted to cereals. Some of the important crops in 1911-12, in respect of area and yield, were as follows: wheat, 444,870 hectares, 6,150,231 metric quintals; barley, 41,876 hectares, 707,862 quintals; oats, 27,972 hectares, 490,651 quintals; corn, 22,766 hectares, 387,774 quintals; kidney beans, 36,559 hectares, 454,262 quintals; potatoes, 26,672 hectares, 2,627,954 quintals; vines, 56,781 hectares, 19,643,799 decaliters of wine. Chile's wheat production was 5,162,035 quintals in 1907-08, 4,828,822 in 1908-09, 5,373,281 in 1909-10, 4,960,216 in 1910-11, and 6,150,231 in 1911-12. Wool production in 1911-12 amounted to 92,493 quintals, of which 57,035 were credited to Magallanes territory.

The mineral resources are exceptionally rich and include, besides various metals, deposits of sodium nitrate, iodine, calcium borate, sulphur, salt, coal, etc. Formerly the country was famous for its copper production; there was a decline, but in recent years the copper output has increased. The northern provinces of Antofa-

gasta and Tarapacá are notable for their enormous production of sodium nitrate. The value of the sodium nitrate export in 1912 was about 86.7 per cent of the value of the total exports. The value of the total mineral production in 1912 is reported at 372,662,774 pesos, as compared with 178,768,170 pesos in 1902.

Industrial establishments, as reported for 1911, numbered 5722; capital, 471,287,333 pesos; persons employed, 74,618; wages paid, 73,064,668 pesos; raw materials used, 300,727,098 pesos (Chilean 194,966,052 pesos, foreign 105,761,046 pesos); annual product, 535,037,093 pesos.

COMMERCE. Imports and exports in 1913 were valued at 329,517,811 pesos gold and 391,237,197 pesos gold respectively, as compared with 334,454,779 and 377,104,530 in 1912. In the special trade, imports and exports have been as follows, in thousands of pesos gold:

	1909	1910	1911	1912	1913
Imports	262,083	297,486	348,990	334,455	329,518
Exports	306,430	317,213	330,621	377,105	391,237

The principal classified imports in 1912 and 1913 respectively were as follows, in thousands of pesos gold: textiles and their manufactures, 82,016 and 76,843; mineral substances, 59,711 and 61,028; fuels, oils, paints, etc., 49,312 and 54,316; machinery, apparatus, instruments, etc., 44,264 and 40,990; vegetable substances, 36,235 and 38,176; animal substances, 24,813 and 21,502. Classified exports in 1912 and 1913, in thousands of pesos gold: mineral products, 336,068 and 346,209; animal products, 20,770 and 25,225; vegetable products, 19,836 and 19,399; beverages, 173 and 192; miscellaneous, 258 and 213; total, 377,105 and 391,237. The principal exports are reported as follows for 1911 and 1912 respectively, in thousands of pesos gold: sodium nitrate, 262,649 and 292,327; copper, 18,687 and 30,777; wool, 7696 and 8367; calcium borate, 6231 and 6145; iodine, 5140 and 5385; hides and leather, 8983 and 5330; meat, 3769 and 3249; oats, 1590 and 2363; wheat, 1384 and 2124; beans, 1834 and 1604; bran, 1150 and 1286.

Imports and exports by principal countries, in thousands of pesos gold:

	Imports		Exports	
	1912	1913	1912	1913
U. Kingdom	105,751	98,709	150,966	152,187
Germany	90,929	81,086	76,879	84,309
United States	46,045	55,089	67,168	83,324
France	19,893	18,146	21,010	24,241
Belgium	8,555	15,538	12,683	15,548
Peru	18,198	18,179	2,502	2,557
Australia	8,273	9,161	851
Argentina	11,238	8,939	8,093	2,835
India	9,144	8,732
Italy	8,246	8,702	1,089	1,786
Spain	8,513	8,112	5,026	2,705
Brazil	2,856	2,663	4,745	1,439
Uruguay	1,521	1,742	7,446	1,162
Netherlands	960	184	11,604	12,247
Japan	866	887	2,628	8,658
Total including other	334,455	329,518	377,105	391,237

Share of the principal ports in the total trade, 1913: Valparaíso, 47.98 per cent of the imports and 5.08 per cent of the exports; Talcahuano, 10.83 and 2.67; Antofagasta, 10.07 and 15.91; Iquique, 8.65 and 17.91; Taltal, 3.10 and 9.58; Tocopilla, 1.89 and 10.54; Punta Arenas, 3.16

and 4.04; Pisagua, 0.71 and 3.45; Mejillones, exports 11.12 per cent; Caleta Buena, 7.71; Coloso, 4.72.

SHIPPING. In 1912 there were entered in the foreign trade 5093 steamers, of 15,070,782 tons, and 579 sail, of 1,061,745 tons; total, 5672 vessels, of 16,132,527 tons. Cleared 4548 steamers, of 13,387,035 tons, and 498 sail, of 926,480 tons; total, 5046 vessels, of 14,313,515 tons. In the coasting trade, there were entered in 1912, 9133 vessels, of 10,342,888 tons; and cleared 9852 vessels, of 12,535,309 tons. Of the steamers entered in the foreign trade, 2355, of 7,396,697 tons, were British; 1685 steamers, of 5,788,339 tons, German; 759, of 1,056,153 tons, Chilean.

At the end of 1912, the merchant marine included 149 vessels, of 83,070 tons; of which, steamers numbered 83, of 51,167 tons.

COMMUNICATIONS. At the end of 1912, there were in operation, as officially reported, about 8000 kilometers of railway. This figure includes the Bolivian section of the Arica-Alto de La Paz line (233 kilometers) and the Bolivian section of the Antofagasta-Oruro line (482 kilometers). Some details are shown below:

	Km.	Re- ceipts	Ex- penditures
Arica à La Paz <i>b</i>	439.5 <i>c</i>	845	1,054
Longitudinal Norte y Sur <i>b</i> ..	1,320.0	668	1,800
Aislados del Norte <i>d</i>	994.0	1,900	2,249
Red Central.....	2,286.4	37,084	42,475
Regional de Chillán à Pinto..	85.0	64	78
Regional de Aconcagua à Castro..	97.0	18	54
Private lines.....	2,872.0	38,812	22,384
Total.....	8,044.2 <i>e</i>	78,832	70,039

a Thousands of pesos gold. *b* For year 1913. *c* Of which, 233 km. in Bolivia. *d* Of which, 482 km. in Bolivia. *e* 4998 miles, of which 444 in Bolivia.

On the Trans-Andine Railway, which was one of the most costly and difficult to build, there was experienced a severe winter, and the first mail train was operated only on August 20, no passenger trains having passed over that railway since the end of May, and the international train from Chile to Buenos Aires was suspended. The Howard Syndicate notified the Chilean government that it would make delivery of the Southern Longitudinal Railway on August 1. It was stated that there was danger of a general railway strike in Chile, owing to the dismissal of a number of employees on the State railway.

Towards the end of the year the Chilean government notwithstanding its limited financial resources determined to proceed with the construction of the following new lines: Paine to Talagante; a line to connect the Traiguén branch with the main line; the Iquique and the Antofagasta extensions to the Longitudinal Railway; a line from Melpilla to Las Cabras; Valparaíso to Casablanca; San Vicente to Perallilo and Parronal; Valdivia to Los Canelos; Freire to Cunco; Los Angeles to Santa Barbara and Quilaco; San Clemente to Colorado, with a branch to Queri; San Bernardo to Puente Alto; Quilpe to Melipilla; San Carlos to San Fabian; Artificio to Quincolmo; El Alamo to Molina; Cauquenes to Chanco; Quirihue to Coelemu; Yumbled to Rio Claro; Bulnes to San Ignacio and thence to El Recinto.

In 1912 State telegraph offices numbered 364, with 15,501 kilometers of line and 29,015 kilometers of wire; offices of the State railways, 277,

with 5319 kilometers of line; offices of private lines, 139, with 4847 kilometers of line and 14,409 kilometers of wire. In all, there were 780 telegraph offices, with 25,667 kilometers of line, 1595 telegraphic instruments, and 2466 employees. There are several radiotelegraph stations. Post offices in 1912 numbered 1114.

FINANCE. The monetary unit is the peso. The peso gold is equivalent to 18 pence, or about 36.5 cents; the paper peso fluctuates in value. Accounts of revenue and expenditure are kept partly in pesos gold and partly in pesos paper. Reduced to gold value, revenue and expenditure are stated as follows, in thousands of pesos:

	1901	1906	1911	1912	1913
Revenue ..	105,843	165,721	197,502	221,882	209,788
Expenditure ..	120,282	142,429	199,014	235,127	216,487

For 1913 the ordinary revenue is stated at 96,752,728 pesos gold and 164,950,825 pesos paper; ordinary and extraordinary, 97,165,452 gold and 207,908,819 paper. The expenditure corresponding to the budget for 1913, is stated at 50,335,966 pesos gold and 266,914,989 pesos paper; the total expenditure made in 1913, 78,526,901 gold and 254,695,833 paper. Of the 1913 revenue, the sum of 90,683,769 pesos gold and 61,269,987 pesos paper was derived from customs; of the gold revenue, export duty on sodium nitrate furnished 90,128,621 pesos. The budget for 1914 showed estimated expenditure by ministries as follows: interior, 549,399 pesos gold and 53,035,441 pesos paper; foreign affairs, 1,510,146 and 4,722,708; justice, 10,651,649 paper; public instruction, 344,118 gold and 38,993,906 paper; finances, 60,401,310 and 18,040,995; war, 451,172 and 39,612,402; marine, 35,736,518 and 18,828,026; industry and public works, 221,256 and 25,367,552; railways, 22,554,664 and 42,774,288; total, 121,768,583 pesos gold and 252,626,967 pesos paper.

Public debt, Dec. 31, 1913: external, £33,912,340 (452,164,533 pesos gold); internal, 155,822,535 pesos gold and 32,920,839 pesos paper. Paper money in circulation at end of 1913, 183,822,354 pesos.

ARMY. An active army, in reality a national militia, is maintained and by law all citizens from the ages of 18 to 45 are liable to service, though only about 20,000 are actually in service. The recruits are summoned to the colors in their twentieth year and are trained for one year, after which they serve nine years in the reserve of the active army, and the remainder of the time in the second reserve which is organized as a second line army and in time of war would bring the total strength up to about 80,000 men. Each of the four military districts into which the country is divided furnishes a division on mobilization. There are 48 battalions of infantry, 8 regiments of cavalry, 2 batteries of horse artillery, 32 batteries of field artillery, 8 batteries of mountain artillery, 2 battalions of fortress artillery, and 8 battalions of engineers.

NAVY. The Chilean navy, as reported for 1914, included the following: three battleships, aggregating 19,016 tons; one armored cruiser and four protected cruisers, 21,468 tons; two torpedo cruisers, 1474 tons; six torpedo-boat destroyers, 4553 tons; five torpedo boats, 728 tons; three transports, 30,565 tons; and several auxiliary vessels. Personnel, 515 officers and 6284

men. There were under construction in 1914 two dreadnoughts, aggregating 56,000 tons; two submarines, 610 tons; four torpedo-boat destroyers, 7200 tons.

GOVERNMENT. The legislative power rests with a congress of two houses, the Senate (36 members, elected for six years) and the Chamber of Deputies (118 members, elected for three years). The chief executive is the President, who is elected by indirect vote for five years and is ineligible for the next term. He is assisted by a responsible ministry and by a council of State, which includes five members nominated by himself and six chosen by the congress. The President in 1914 was Ramón Barros Luco, who was inaugurated Dec. 23, 1910.

HISTORY. The Congress was called in special session in May, for the purpose of voting a bill for the conversion of the paper *peso*. The bill provoked an unexpectedly long debate and was still under discussion when the special session gave place to the regular session on May 31. The presidential message, delivered at the opening of Congress, contained the affirmation that, after wiping out previous deficits, the ordinary revenues (374,000,000 *pesos* or \$75,000,000) would leave a surplus of 34,000,000 *pesos* (\$7,000,000) to be expended on public works. For questions arising in regard to the preservation of Chilean neutrality during the war consult the article on the WAR OF THE NATIONS. For Chile's part in the attempted mediation of the Mexican question, consult the article on MEXICO, *History*. See also INTERNATIONAL ARBITRATION AND PEACE, *Bryan-Wilson Treaties*.

CHINA. Formerly the Chinese Empire; since Jan. 12, 1912, the Chinese Republic, following a successful revolution ended by the abdication of the infant Emperor. Capital, Peking.

AREA AND POPULATION. The republic is composed of China proper, or "the 18 provinces," Manchuria (three provinces), Sinkiang province (including East Turkestan), and Mongolia and Tibet (dependencies). Outer Mongolia was recognized as autonomous in 1913. The population is unknown. Of China proper there have been many censuses or government estimates, based upon enumeration by households. The computation is made by multiplying by the average in a household, exclusive of children under six years of age. In the table below the area is given in square miles by provinces, with the census taken in 1910, and the 1912 estimates of the Maritime Customs:

	Sq. M.	Census '10	M. C. Est.
Anhui	54,826	14,077,688	36,000,000
Chekiang	38,680	13,924,655	11,800,000

Total provinces	2,445,851	325,817,760
Mongolia	1,076,292	1,800,000 (†)
Tibet ‡	756,000	2,000,000 (†)
Grand total	4,278,143	329,617,750

* Honan, Kansu, Kweichow, Shansi, and Shensi, 55,000,000. † Not including children under six years. ‡ Including Koko-Nor and Tsaidam.

For the census taken in 1910 the enumeration by households differs in different provinces, averaging from 3.1 to 5.8; in Chihli it was 5.5, but in Peking city 5.8. In some provinces the average was not ascertained, or at any rate not published. The mean of the ascertained averages was 4.8, and this figure was used in calculating the population of provinces for which no specific average is given. The problem is further complicated by incomplete returns from Shansi and Szechwan. The figure for the latter given in the table is not shown by the census, but is the number reported by the viceroy to the Peking authorities. The population figures for China proper, excepting the one for Szechwan, are those published in 1912 by W. W. Rockhill, the late American minister at Peking, in his monograph interpreting the 1910 census; he concludes that, although the new information furnished by the 1910 census is insufficient for definite conclusions, it tends to confirm the opinion that the population of China is much smaller than we have been led to believe and that in the last century it has increased only slowly if at all. The annual estimates of the Maritime Customs as given above for 1912 are widely quoted; but in respect of more than half of the provinces they are undoubtedly greatly exaggerated, being based on no known authority.

According to a census undertaken by the Minister of the Interior in 1912, Peking had an estimated population of 692,500. The 1910 census gives Peking a population of 805,110, of whom adult males numbered 500,819, adult females 256,638, and children between the ages of 6 and 16, 47,653. Estimating the proportion of infants under six at 2 per cent, the total of all persons in Peking would be about 821,000. The population of the larger treaty ports following is taken from the Maritime Customs estimate, which are probably more nearly accurate than those for the provinces: Canton, 900,000; Hankow, 826,000; Tientsin, 800,000; Shanghai, 651,000; Foochow, 624,000; Chungking, 598,000; Soochow, 500,000; Ningpo, 350,000; Hangchow, 350,000; Nanking, 267,000; Changsha, 250,000; Chinkiang, 184,000; Antung, 161,000; Wuhu, 122,000; Amoy, 114,000; Wenchow, 100,000; Shasi, 90,000; Swatow, 66,000; Kongmoon, 62,000. An estimate of the custom's authorities in 1912 returns the number of foreigners resident in China at 144,754, of whom 75,210 were Japanese, 45,908 Russian, 8,690 British, 3869 American, 3133 French, 2817 German, 2785 Portuguese, and 2342 other nationalities.

EDUCATION. During the year 1910 the reorganization and development of the educational system was projected and the contemplated establishment of a university at Peking was carried out. Occidental learning begins by degrees to replace the ancient system, which was limited almost entirely to the study of Chinese classical literature. The imperial edict of Sept. 3, 1905, abolished the system of examination in the classics as the only passport to State employment. New schools are opened daily, and because of the lack of scientific text-books in the vernacular, the study of Japanese and European languages has become an imperative necessity. Old style schools, whose curriculum is confined practically to the Chinese classics, still exist in sufficient numbers so that the traditional type of education is not yet extinct. There are several medical schools. The Imperial University (Peking) and the university at Tientsin have a European and Japanese staff in addition to Chinese professors. A new university at Hankow is projected. There are over 300 daily, weekly, or monthly journals in the country.

The creeds acknowledged by the Chinese are Confucianism, Buddhism, and Taoism. Temples of all creeds numbered, according to the police report at end of 1908, 1049, with 1553 Buddhist priests, 133 Taoist priests, and 102 nuns; students 934, servants 975, and lodgers in temples 15,445. Ancestor worship is everywhere observed. Mohammedans number about 30,000, principally in the Northwest. There are about 1,000,000 Roman Catholics, and many Protestant sects have missions throughout the country. Nature worshippers still exist in the hill regions of the interior.

INDUSTRIES. Agriculture is the leading industry, though the country is rich in minerals. In the North the principal crops are wheat, barley, corn, millet, and other cereals, and beans and peas; in the South, rice, sugar, indigo, and cotton are grown. In the South and West tea and silk cocoons are important products, and sericulture is carried on in all the provinces. About 27 per cent of the world's supply of raw silk comes from China. Large quantities of opium were formerly produced, but the output, as well as the importation from India is being greatly restricted, pursuant to government decree. Szechwan has been a large producer of opium, but since the agreement between China and Great Britain (May 8, 1911) to suppress both native production and Indian import, Szechwan has substituted wheat for poppy cultivation, and promises to regain her position as one of China granaries. The government of India has agreed that the export of opium from India to China shall cease before 1917, conditionally upon the establishment of absolute proof of the non-existence of poppy cultivation throughout the republic by that date. No Indian opium is to be conveyed into any Chinese province which has succeeded in suppressing cultivation. Smuggling over the Southern border, however, still goes on, and in 1912, owing to the disturbed state of the country and the inability of the new government at Peking efficiently to enforce the law in the provinces, the area under poppy cultivation greatly increased, entailing much friction between the Chinese and British governments.

The mineral wealth of the republic is very great, and its coal deposits are known to be

among the richest in the world; but their exploitation is comparatively insignificant. Of the minerals worked, the more important are tin (in Yunnan), iron, antimony, lead, zinc, copper, and salt. The iron works at Hanyang, near Hankow, were seriously damaged during the revolution of 1911. Although many mining concessions have been granted to foreigners, the opposition of provincial or other authorities has effectually prevented their development.

Cotton, silk, and wool are the leading manufactures. A total of 34 mills was reported Jan. 1, 1912, with 932,506 spindles and 4635 looms. Flour and rice mills are being erected at the large centres. The silk trade has been injured by the substitution in European markets of inferior imitations.

COMMERCE. In the table below are shown values in haikwan, or Maritime Customs taels, of imports general and special (for consumption) and exports general and special (Chinese produce) for successive years:

	1910	1911	1912
Imps. gen.	476,553,402	482,576,127	485,726,000
Imps. spec.	462,964,894	471,508,943	473,097,031
Exps. gen.	394,421,836	388,410,350	382,949,000
Exps. spec.	380,838,328	377,388,166	370,520,408

Details of the 1912 imports for consumption and exports of domestic produce are given in the table below, with values in thousands of haikwan taels.

Imports	1000 t.	Exports	1000 t.
Cotton textiles	81,425	Raw silk	76,789
Cotton yarns	62,664	Beans, etc.	41,206
Opium	47,707	Tea	33,778
Petroleum	24,846	Cotton	17,252
Sugar	24,086	Silk Mfrs.	17,018
Flour	12,694	Skins	15,196
Tobacco	12,425	Oils	15,046
Rice	11,660	Sesame	11,966
Dyes	11,462	Tin	11,711
Fish	10,551	Straw goods	7,644
Iron	8,806	Wool	6,863
Coal	8,221	Wheat	6,258
Arms, etc.	7,748	Cattle	6,555
Matches	6,985	Mattings	3,770
Leather	6,414	Tobacco	3,761
Machinery	5,792	Silks	3,741
Paper	4,804	Peanuts	3,599
Sacking	4,156	Meats	3,884
Timber	4,042	Coal	3,862

Of the total tea export (197,559,867 pounds in 1912), 12,771,733 pounds went to Hongkong, 13,054,000 pounds directly to the United Kingdom, 62,997,466 pounds to Russia and Siberia, and 21,006,266 pounds to the United States. The trade with Hongkong is principally transit, the imports into China from Hongkong being chiefly from Great Britain, and the exports from China to Hongkong being intended for re-shipment to European and other countries. The principal countries of origin and destination in the 1912 trade follow, with values in thousands of haikwan taels: Hongkong, 147,801 imports and 103,384 exports; Japan, 91,017 and 45,262; United Kingdom, 74,856 and 15,900; British India, 46,646 and 7,573; United States, 36,198 and 35,050; Russia, 21,232 and 55,197; Germany, 21,130 and 14,339; Belgium, 8,751 and 6,555; Straits Settlements, 8605 and 6339; Macao, 6408 and 4573; Dutch East Indies, 6048 and 1613; French Indo-China, 3319 and 1497; Korea, 3155 and 5443; France, 2932 and 38,809; Austria-Hungary, 2275 and 1873; Canada, 1111 and 885; Netherlands, 982 and 7615; Italy, 486 and 10,843; other coun-

tries, 2774 and 7770; a total of 485,726 imports and 370,320 exports in the special trade. Re-exports, 12,629; resulting in total net imports 473,097 and gross exports 382,949. In addition to the oversea trade, the republic has an extensive coasting and river traffic, carried on by British and other foreign vessels as well as by native craft.

SHIPPING. Vessels entered and cleared in the 1912 foreign trade are shown in the table below according to nationalities:

	Entered		Cleared	
	No.	Tons	No.	Tons
British . . .	4,944	4,930,821	5,084	5,185,716
Japanese . . .	2,140	2,991,411	2,096	2,960,345
German . . .	710	1,310,494	745	1,467,953
French . . .	476	599,589	474	575,807
American . . .	256	262,178	243	255,254
Norwegian . .	240	242,873	250	250,802
Russian . . .	105	193,777	111	213,511
Chinese . . .	25,466	50,859,991	25,111	2,002,961
Total* . . .	34,543	12,847,881	34,267	13,223,601

*Including other.

Included in the merchant marine in 1912 were 68 vessels of 100 tons and over, with an aggregate net tonnage of 90,420.

COMMUNICATIONS. Railways reported open to traffic at the beginning of 1912 had a total length of 5822½ miles inclusive of Russian and Japanese lines in Manchuria; inclusive of lines on which work had been begun (though subsequently suspended or abandoned); there were reported as under construction, 2202 miles. At the beginning of 1914 there were reported to be 5960 miles open to traffic and 2273 under construction. An edict providing for the reversion to government control of all trunk railway lines was issued in 1911. This edict was promulgated May 9, 1911, and did much to contribute to the unrest that exploded in the rebellion of the following October.

In 1914 in the Province of Shantung there were two railways in operation, built of standard gauge: the Shantung railway from Tsingtau to Tsinanfu, 256 miles, and the Tientsin-Pukow line, 690 miles long, traversing the western portion of the province. The former was German owned and operated. The latter was divided into two sections; the northern (457 miles long and built by the Germans), ran from Huschowfu on the southern border of Shantung to Tientsin; the southern section, built by the British, but in common with the northern section operated by Chinese, is 235 miles long and extends from Huschowfu south to Pukow on the Yangtze River. The Chinese government administered both sections as an undivided government railway, with a European engineer and commission. The Shantung Railway was taken possession of by Japan early in October and remained under her control during the year, notwithstanding Chinese efforts to prevent it.

The Russian diplomatic agent in Mongolia signed an agreement in Kyachta, on September 17-30, with the Urga government, which recognized the right of the Mongolian government to build railways within its own territory, and approves the policy of coöperation with the Russian government and Russian lines, with certain concessions to the latter country.

Considerable commercial and political importance was attached to the right to construct the railway from Blagoveshchensk, on the left bank

of the Amur River, to Aigun, Mergen, and Harbin, with a connection between Mergen and Tsitsihar, secured by Russia from China. This taps large and rich tracts of territory, and gives access to the Amur River and the new Amur Railway, on the left bank of the river, and binds this region to Russia, giving her a railway connection and dominance over the whole of Northern Manchuria, as she owns the line from Vladivostok through Manchuria to Russia, and had nearing completion the railway traversing Russian territory from Vladivostok north of the Amur to Karimska, where it joins with the Siberian Railway. The new railroads would enable Russia to put Harbin in immediate control of the trade approaches to the large territory of the Amur, and give her the northern section of the projected line from Chinchow to Aigun. The right to build the Chinchow-Aigun Railway was secured from China by Americans, but the southern half of it was granted to Japan by China, and the northern section secured during the year by Russia.

In 1914 it was reported that more provinces in China were engaged in railway construction than at any previous time. The Board of Communications and the British and Chinese Corporation, Ltd., during the year signed an agreement for the construction of some 600 miles of railway from Nanking to Nanchang and Ping Siang, where it would connect with the Ping Siang and Changsha and Hankow-Canton Railways. This line it was thought would materially strengthen British interests along the Yangtze-Kiang, especially in connection with the Pukow-Sinyangchow Railway. This new line was to connect with Hangchow and Shanghai, and also with a line from Nanchang to Wuchang, so that there would be an aggregate length of nearly 1000 miles, to be built and operated under British auspices and from British materials.

ARMY. Little progress was reported during 1914 in the reorganization of the Chinese army, which was interfered with by the rebellions occurring after the Revolution of 1911. The governing scheme was that of the edict of 1912, providing for the recruitment and formation of a model army on European lines, consisting of 36 divisions, each of about 10,000 combatants. While conscription is reserved, the army is nominally formed by volunteers who are in active training for three years. The organization is far from cohesive though there are some well drilled units, and few military critics in 1914 would hazard an estimate of the strength of the forces, one authority stating the peace establishment at an uncertain 150,000 men which on a war basis could be raised to some 200,000. At any rate during the troubles of 1914 the Chinese government did not essay to use its military strength in the enforcement of neutrality.

NAVY. A plan for the reorganization and reconstruction of the Chinese fleet was under discussion at the beginning of 1914, between the Chinese government and the British admiralty, whereby British officers would be lent to China on much the same terms as they are now lent to Greece. Aside from small craft, the only serviceable vessels are several cruisers, and none of these is an armored ship. Four of them (one of 4300 tons and three of about 300 tons each), were built in 1897 and 1898. The fifth, the

Ying Swei, of 2400 tons, was launched at Barrow in July, 1911, and the sixth, the *Chao Ho*, of 2400 tons, at Elswick in the following October. Both vessels were completed in 1912. A seventh cruiser, of the same type as the *Ying Swei*, was launched at the yard of the New York Shipbuilding Company in May, 1912, and in that year three gunboats, of 780 tons each, were built in Japan, and two smaller ones at Kiel. At the end of 1913 two destroyers were building, one at Elbing and one at Trieste. There is a considerable number of torpedo boats, river gunboats, etc., of which not more than half the torpedo boats are fit for action. Of the four destroyers (built 1898-99), captured in 1900 by the allies, Great Britain, France, Germany, and Russia each obtained one.

FINANCE. No estimates of revenue and expenditure are published as in other countries; calculations, based upon imperfect data, recently placed the revenue at 297,000,000 taels and the expenditure at 576,000,000 taels. The Imperial Maritime Customs, with a large staff of foreign and Chinese subordinates, is the controlling service, under the direction of an inspector-general (British), F. A. Aglen in 1914; so long as British trade predominates, this post is to be held by a subject of Great Britain. His powers have not been materially affected by the transfer in May, 1906, of the department from the Foreign Board to the Board of Revenue, when two Chinese administrators-general were appointed. Besides the collection of dues at treaty ports, the department directs their lighting and navigation and maintains a small fleet of cruisers to enforce its regulations. The department formerly controlled the post office, but this was transferred in 1911 to the ministry of communications. The receipts from maritime customs in 1912 were returned at 35,526,495 taels, and from opium likin at 4,424,117.

The Haikwan, or maritime customs tael, fluctuates with the price of silver; it was worth about 79 cents in 1907, 65.5 cents in 1908, 63.4 cents in 1909, 66 cents in 1910, 65 cents in 1911, 75.3 cents at the end of 1912, 72.3 cents at the end of 1913. By a government decree promulgated at Peking Feb. 10, 1914, a new currency system was introduced whereby a coinage will be substituted for the various and sundry coins and sycee now in use and representing the basis of the various issues of paper currency by the several Chinese provinces. Under the mandate only the central government at Peking can now mint coins. The new currency will be on the decimal system; the unit will be the yuan, or dollar, which is to be of 72 candarons of 90 per cent silver and 10 per cent copper; the actual quantity of pure silver is fixed by the mandate at 23.97795048 grams. The four silver coins are the yuan, the half-yuan, the 20-cent piece, and the 10-cent piece. There will be one nickel coin, the 5-cent piece, and five kinds of copper coins—the 2-cent, 1-cent, 5-li, 2-li, and 1-li pieces. The values are in decimal progression; one-tenth of a yuan is the chiao, or 10-cent piece; one hundredth of a yuan is the fen, or 1-cent piece; one-thousandth of a yuan is a li. The half-yuan will contain 70 per cent of pure silver and the other silver coins the same. The half-yuan will contain 9.583777 grams of pure silver, the 20-cent piece, 3.72990248 grams, and the 10-cent-piece 1.86495124 grams.

GOVERNMENT. The last reigning Emperor of

the Manchu dynasty which began in 1644, was Pu-yi (reign title, Hsün-t'ung), who was born Feb. 11, 1906, and succeeded his uncle, Tsai-t'ien (reign title, Kuang-hsu), who died Aug. 14, 1908. His father, Prince Chun, was regent. Pu-yi abdicated Feb. 12, 1912, and a republic was established, which was recognized by the United States May 2, 1913, and by the other powers Oct. 6, 1913. Yuan Shi-kai was declared provisional President Feb. 15, 1912, and was elected (Oct. 6, 1913) and inaugurated (October 10) as the first constitutional President, for the term 1913-19, with General L. Yuan-hung as Vice-President. The presidential office is open to men of at least 40 years of age, who have resided in the country for 10 years. There is a legislative Assembly composed of an Upper House of 274 members, elected by the provincial assemblies and various electoral colleges for six years, one-third retiring every two years; and a Lower House of 596 members, elected by restricted manhood suffrage. A political council of 71 members met first on Dec. 15, 1913, to discuss an appointment of another council to draft a constitution and to advise the government on administrative measures.

The ministry (August, 1913) was composed as follows: premier, Hsu Shih Ch'ang; minister of finance, Chou Tzu Ch'i; foreign affairs, Sun Pao Ch'i; education, T'ang Hua Lung; war, Tuan Ch'i-jui; justice, Chang Tsung Hsiang; interior, Chu Ch'i Ch'ien; agriculture and commerce, Chang Ch'ien; communications, Liang Tun Yen; navy, Liu Kuan Hsiung.

HISTORY

YUAN SHI-KAI'S CONSERVATIVE REFORMS. The events of the year 1914 made it more than ever apparent that since the successful Revolution of 1911 a powerful reaction had set in. In their campaign against President Yuan Shi-kai, whom they disliked both for his conservatism and for his domineering attitude, Dr. Sun Yat-sen and other radical republicans had brought about the abortive July Rebellion of 1913, which was as unfortunate for China as it was disastrous for themselves; while the radical republicans in Parliament by too stubbornly opposing the President's policies had prevented the National Assembly from accomplishing any solid constructive work, and thus provoked Yuan Shi-kai to issue the famous mandate of Nov. 5, 1913, which dissolved the *Kuo Ming Tang* (or radical-republican, anti-presidential party) and deprived its members of their seats in the National Assembly. The remaining members of the National Assembly lingered forlornly in Peking until that ill-starred body—China's first parliament—was formally dissolved on Jan. 12, 1914. The new year, therefore, found Yuan Shi-kai substantially in possession of dictatorial power, with a free hand to work out his own policy of conservative progress. The Chinese people, he held, were not violently to be wrenched from their ancient customs by an impatient group of inexperienced enthusiasts, but were to be prudently conducted along the path of progress by a strong and a wise government. The presidential authority, according to him, must be strong enough to command the respect of foreign nations and to compel the obedience of domestic disturbers; it must be wisely exercised to maintain the balance between conser-

vatism and innovation, in order that China might preserve all that was best in her venerable civilization of the past, while cautiously absorbing what was advantageous in the political, military, and industrial culture of the modern world. Working out this policy, in the year 1914, Yuan Shi-kai proved his conservatism by restoring the public worship of Heaven and the cult of Confucius; by reviving the old lunar New Year Day (Jan. 26); by re-introducing some of the features of the old official system; and by abolishing some of the republican innovations in the government; at the same time he gave evidence of constructive statesmanship by introducing a revised and more practical constitution, by reforming the judicature (in accordance with a mandate dated Dec. 28, 1913), by establishing a model army corps for the introduction of European military methods, by imposing the death penalty on officials who accepted bribes, by threatening to degrade officials who retained the traditional queue, by endeavoring to reorganize the fiscal and railway systems, and by inviting young men who had studied abroad to present themselves for employment in the government's service. With the revival of the old religious ceremonies we shall deal more particularly in the following section; at present we shall concern ourselves with the constitutional changes of the year.

CONSTITUTIONAL CHANGES. To replace temporarily the National Assembly, Yuan Shi-kai convoked an Administrative Council, an advisory body partly appointed by the President, and partly by the provincial Governors. This Administrative Council aided Yuan in drawing up rules for the formation of a Constitutional Convention, which were promulgated Jan. 26, 1914. On March 18 Yuan formally inaugurated the Constitutional Convention, and directed it to revise the Provisional Constitution compiled at Nanking in 1912. With admirable expedition, and under the presidency of Sun Yuchun, the Convention prepared the draft of a new provisional constitution, which on May 1, 1914, was promulgated by the President to replace the Provisional Constitution of March 11, 1912. By the new Provisional Constitution (1) the President was entrusted with almost regal powers. The Secretary of State and the nine ministerial departments were responsible to no parliament, but rather to the President, who thus clearly controlled the civil administration. The President was, moreover, commander-in-chief of the army and navy, with power to declare war and peace, and even to make treaties: only if the borders of the country were in question, or if burdens were to be imposed by treaty on the Republic, must he obtain the ratifying consent of the Senate. (2) The Senate (*Lifayuan*) was to be a legislative body with the privilege of drafting bills, preparing the budget, and consenting to loans; it was to be convoked by the President and dissolved by the President with the consent of his Council of State (*Tsanchenggyuan*). (3) Other interesting clauses in this remarkable document concerned the impeachment of the President before a Special Court of Justice, and of ministers before a Court of Administration, upon accusation by the Censors. It should also be noted that in times of grave danger to the nation, the President in council might issue legislative decrees without waiting to convene the Senate. (4)

This new Provisional Constitution of May 1, 1914, was to remain in effect until a final constitution had been drafted by a special committee of ten members of the Council of State and ratified by a National Assembly—not the old National Assembly, but a new body whose membership was to be determined by the same committee of ten.

The Senate (*Lifayuan*) was not immediately called into existence, nor were the rules governing its formation at once laid down. Yuan Shi-kai's first concern was rather to create his Council of State (*Tsanchenggyuan*), and to this end he published a presidential mandate on May 23 outlining the constitution of the Council; on May 26 he nominated the members; and on June 20 the Council of State held its formal inaugural session. With General Li Yuan-hung (Vice-President of the republic) as chairman, there sat seventy councilors: among them were former officials, viceroys, governors, retired diplomats, and a few members of the dissolved parliament. Partisans of "Young China" might complain justly that the new Council of State included no champion of their democratic ideas. A new edict was promulgated on December 29, fixing the term of office of the President at ten years, but providing for an indefinite continuation of a president in office, if the Senate, by a two-thirds vote, consider "that the actual political situation makes desirable such extension."

Hardly less important than the reorganization of the central government were the changes effected in the local government system during the year 1914. On February 28 Yuan Shi-kai issued a mandate abolishing the Provincial Assemblies which had been set up by the Revolution. On May 23 he took the further step of separating the military from the civil administration in the provinces and reviving, with important modifications, the old Manchu provincial system. The civil administration of each province was entrusted to a High Intendant (*Chinganshih*), under whom were Intendants (each governing a "circuit"), and a still lower order of magistrates. The *Tutuhs*, or provincial military commanders, were done away with a month later; they had given too much trouble to the central government, and their powers smacked too strongly of feudalism; in place of the *Tutuhs* new officers were created with the dignified title of *Chiangchun* and with command over the military affairs of not one, but six or seven provinces. In this fashion Yuan Shi-kai hoped to break down the old provincial lines in military affairs and to strengthen the hands of the Peking government in both financial and military control. Somewhat later in the year reports were received that one of Yuan's ministers had submitted proposals to the *Tsanchenggyuan* for the establishment of new local assemblies on the basis of a very limited franchise, with the purpose of utilizing the local gentry and head men of the villages in the republican government, and in close correlation with the executive authorities.

REVERSION TO CONFUCIANISM AND THE WORSHIP OF HEAVEN. One of the most interesting, if not the most important, events of the year was the reversion to Confucianism and the Worship of Heaven, already alluded to in a previous paragraph. Only after a lengthy and weighty debate in the Administrative Council did Yuan Shi-kai venture to publish his famous decree of

Feb. 7, 1914, whereby the worship of Heaven and the cult of Confucius were officially authorized to be performed publicly by the President or his deputy, by the provincial Governors or their deputies, and privately by any person who might so desire. The Worship of Heaven, traditionally performed by the Chinese Emperors before the Revolution, was to take place according to ancient custom in the Temple of Heaven at the Winter Solstice, with the use of the ceremonial Kow-tow, and the accompanying sacrifice of a bullock; the President, however, was not to wear the diadem, but only a special costume. The worship of Confucius was to be performed semi-annually by the President in the Temple of Literature, and was actually so performed by Yuan on March 7 and on September 28. This reversion to what many observers had esteemed a religion of the past was in some quarters taken as an indication that Yuan Shi-kai was a hopeless reactionary, opposed alike to Christianity and to progressive constitutional government; and the dissolution of the parliament together with the stringent Press Law (April 3) was cited as an additional evidence of his tyrannical character. It should be remembered, however, that in his decree of February 7 Yuan took especial care to explain that he was not establishing a State Religion, and that the religious liberty of the individual citizen would in no way be violated. At almost the same time Yuan Shi-kai issued a decree ordering local officials to protect Christian missionaries, and deploring the murder of Father Rich (a Jesuit) in Anhui on January 25 by brigands.

It should also be recorded that the government refused to deify the Emperor Hwang Ti, and that when in October the Emperor Hsuan Tung appealed for funds no one responded except General Chang Hsün. In October also was celebrated the anniversary of the Revolution. Thus it appeared that at least for the present Yuan Shi-kai had no intention of restoring the dethroned dynasty. It is therefore only just to regard his reestablishment of the Worship of Heaven and the worship of Confucius as he himself explained it—a public recognition of the moral principles which did in the past and should in the future, help to assure the personal integrity of many of China's citizens, and strongly contribute to the stability and honor of the State. As commentaries on the wisdom of this, and of Yuan Shi-kai's policies in general, considerable interest attaches to the statements of Dr. G. E. Morrison and Dr. Frank J. Goodnow, who had served as foreign political and constitutional advisers to the Chinese President. Dr. Morrison spoke in a most optimistic vein of the situation in China, and called attention to the fact that many of Yuan's officials were men of high character and foreign education; he also remarked the improvement in the financial condition due to the increased yield of the Salt Gabelle under Sir Richard Dane's supervision. Dr. Goodnow expressed the conviction that Yuan was "endeavoring to lead China into the paths of constitutional government as fast as her faltering steps will permit," and the belief "that the form of government provided by the amended provisional constitution is more in accord with the history and conditions of the country than was the original provisional constitution." Still more hopeful

was Professor Jeremiah Jenks of New York University (Director of the Far Eastern Bureau), who stated that he had received reliable information to the effect that Yuan Shi-kai was about to receive the support of the Revolutionary leaders, Dr. Sun Yat-sen, Chen Chi-mei, Hu Hai-king, Wu Han-ming, and Pei Wen-wei. Quite the opposite opinion was held by Professor Charles A. Beard of Columbia University; General Hwang Hsing, the exiled leader of the first Chinese Revolution, and one of the most influential radicals, had personally assured Professor Beard that the report of a reconciliation was quite false; and that such reports were circulated "to curry favor in the United States for President Yuan, to the end that he will be able to finance his despotism" by negotiating a loan in America.

CABINET CHANGES. The constitutional changes of the year were accompanied by readjustments in the Cabinet. Hsuing Hsi-ling, who was elected to be Premier by Parliament in July, 1913, and who formed his Cabinet on Sept. 8, 1913, was relieved of his duties on Feb. 13, 1914. Sun Pao-chi, the Minister of Foreign Affairs, was appointed temporarily to discharge the functions of premier. During the same month the portfolio of education, previously held by Wang Tah-sieh, and the portfolio of justice, previously held by Liang Chi-chao, were bestowed upon Yen Sui and Chang Tsung-hsiang respectively. An even more sweeping redistribution of cabinet posts took place on May 2, 1914, when the Cabinet was constituted as follows (the names marked with the asterisk are those of new members): Secretary of State (the post of prime minister had been replaced by that of secretary of State), Hsu Shih-chang*; foreign affairs, Sun Pao-chi; finance, Chow Tzu-chi; navy, Admiral Liu Kuan-haiung; army, General Tūan Chih-jui; agriculture, Yang Shi-chi*; interior, Chu Chi-chien; education, Tang Hua-lung*; communications, Liang Tun-yen*; justice, Chang Tsung-hsiang.

WHITE WOLF'S BRIGAND REBELS. Throughout the first half of the year the Press was filled with tales of sensational exploits of the terrible White Wolf (*Pai Lang-chai* or *Lao Peh-lang*), who led an army of revolutionaries, religious fanatics, and plain brigands, looting villages, plundering towns, and terrorizing the countryside in the three Provinces of Honan, Hupeh, and Anhui. In the autumn of 1913, White Wolf had surprised the Lutheran missionaries at Tsaoyang in northeastern Hupeh and preyed on the villages along the Hupeh-Honan border. In January, 1914, he looted Loshan, then Kuangshan, then Kuangchow, then Shangcheng and Kushih. Next he crossed the border from Honan into Anhui and descended upon the town of Liuanchow, where his followers murdered Father Rich, a French Jesuit missionary. Moving swiftly and secretly, the White Wolf army was able to take the worthless garrisons and police forces of the various towns by surprise; upon entering a city, the bandits would shoot down all who appeared to resist, and while part of the force kept watch the rest would systematically canvass the town, ruthlessly robbing, and not hesitating at murder and rape. Then, as suddenly as they came, the White Wolves would be gone.

The government troops seemed to be either unable or unwilling to restore order in the ter-

ror-stricken provinces, although Yuan Shi-kai was bitterly reproached for not putting an end to this outrage. In March and April it was reported that fifty thousand government troops were pursuing White Wolf in the Province of Shensi; but always he eluded the hostile armies, and, crossing over into Kansu, continued his devastating career. At Taochow, on June 1, thousands of the populace were killed. But at last, on August 5, White Wolf was killed near Hsueh-chow (in Honan) by a Chinese officer who received \$50,000 reward; White Wolf's followers were now easily dispersed; and comparative quiet was restored. The White Wolf movement had been the most serious disturbance of the year, but minor mutinies had occurred at Kalgan, on June 24, at Chenchow (in Honan), on July 13; there had also been many symptoms of unrest in Nanking and Canton; and on the border of Kiangsu and Shantung had appeared a new secret order of "All Buddhist Boxers."

MONGOLIA. In December the palace of the Hu-tuk-tu, with many sacred objects of great value, was entirely destroyed by fire.

INTERNATIONAL RELATIONS. The Mongolian question, which had approached a critical stage in 1913, owing to the support given by Russia to Outer Mongolia's desire for independence, continued to agitate Chinese opinion, but not so acutely. To be sure, a band of Outer Mongolians made an incursion in January into Inner Mongolia (Inner Mongolia was still under Chinese control, whereas Outer Mongolia had become virtually an independent principality under Chinese suzerainty in 1912), approached to within 100 miles of Kalgan, and killed the local chieftain who was loyal to China. It is true also that in April the self-styled "Imperial Mongolian government" addressed a despatch to British, French, American, and German ministers requesting that their respective governments send to Urga consuls or other representatives to conclude treaties of friendship and commerce with Outer Mongolia. But this time the Mongolians received no encouragement from Russia. In May the Russian foreign minister announced before the Russian Duma that Russia had withdrawn her troops from Chihli Province, as a mark of confidence in Yuan Shi-kai's government, and that the Urga Mongolians, overconfidently counting on Russia's favor, were foolishly attempting to wrest from China Inner Mongolia as well as Outer Mongolia. It will be remembered that the main points at issue between Peking and Petrograd had been settled by the Russo-Chinese treaty of Nov. 5, 1913, which had recognized Outer Mongolia as an autonomous province under the suzerainty of China; various minor questions, however, remained to be settled, and the boundary was not yet definitely determined. A tripartite conference was therefore arranged at Kiakhta between delegates of Russia, China, and Outer Mongolia. On September 9 the delegates came together for the first time.

Quite similar to the Khiakta Conference was the Simla Conference, to which Chinese, British, and Tibetan representatives had been called late in 1913, for the purpose of discussing the question of Tibetan autonomy and delimiting the boundary of Inner and Outer Tibet. Over Outer Tibet China was to retain only a shadowy kind of suzerainty. From the outset the Tibetan negotiations were made difficult by the un-

willingness of the Chinese government to concede what the British and Tibetan envoys demanded; and the conference almost met shipwreck on the fatal question, how much of Tibet was to be included in Outer Tibet. Stubbornly the Chinese refused to give up Kokonor, the Marches of Tibet, and Chiamdo, which the British wished to incorporate in autonomous Outer Tibet. So serious was the conflict of opinion on this point that on July 10 Sir Edward Grey, the British Minister of Foreign Affairs, darkly hinted that the consequences would be disastrous for China if the Peking government should refuse to ratify the agreement finally reached by the Conference.

The opium question, so long a source of difficulty between China and Great Britain, was in 1914 comparatively quiescent, seeming at last to have reached that stage where the Chinese government would be allowed to carry out its campaign to suppress the deadly opium traffic, without hindrance from the British authorities. In the course of a discussion on this topic in the British House of Commons, Mr. Theodore Taylor alleged that in 14 or 15 out of the 22 provinces of China, opium was neither produced nor imported; into 3 provinces opium could still be imported from India; but by the end of the year, it was hoped, the poppy would be cleared out of every Chinese province, and Great Britain would no longer have any excuse to force her opium on the Chinese. Mr. Taylor cited many instances where Chinese officials had publicly burned large stocks of opium, and had shot Chinese farmers who dared to cultivate the poppy.

A few shots fired at the Russian ship, *Napoleon*, in the Ussuri River in June occasioned an interchange of notes between the Chinese and Russian governments, but led to no serious altercation. Sao Ke Alfred Sze was appointed Chinese Minister to Great Britain, and Hsia Chia-fu to the United States. Professor Willoughby of Princeton University was appointed to succeed Professor F. J. Goodnow as foreign adviser on constitutional matters. In February the French *Banque Industrielle de Chine* negotiated a concession involving the construction of 1000 miles of railway from Kamchow to Chungkiang and the flotation of a twenty million dollar loan. The French also received an extension of their Concession at Kwangchowwan, the *de facto* administration of adjacent regions by the French authorities being formally recognized in July. A group of Belgian financiers on July 27 signed a preliminary agreement to construct 1850 miles of railway from Lanchowfu to Kuldja. The Standard Oil Company obtained a concession to exploit the oilfields of Shensi and Chihli provinces for 60 years, the Chinese government to receive five per cent of the crude product. In July, Yuan Shi-kai sanctioned the opening of Chingmen in Fokien as a treaty port.

CHINA AND THE WAR. The War of the Nations, in which Japan, as well as most of the European countries, was involved, affected China closely, in spite of her neutral position. At the outset, Yuan Shi-kai hoped that the Far East might not become a theatre of war, for a conflict on Chinese soil might prove worse than embarrassing for China. He therefore early declared China's neutrality, instructed the provincial and military authorities to maintain an atti-

tude of irreproachable impartiality, and appealed to President Wilson to urge the limitation of the war to Europe. The dismantling of several British gunboats at Hankow was but one of many instances showing the sincerity of China's neutrality. But the entry of Japan into the conflict (see *WAR OF THE NATIONS*) put China into a very delicate and difficult position. The Japanese ultimatum had called upon Germany to surrender the German leased territory of Kiaochow to Japan "with a view to the eventual restoration of the same to China." And it seemed to be clearly understood at Washington that Japan intended to return Kiaochow to China, safeguard the integrity of the Chinese Republic, protect the commercial privileges of the various Powers in China, and act in accordance with the "equal opportunity" principle of the Anglo-Japanese Alliance. Such action would doubtless have been on the whole favorable to China, and welcome. But from the first, the Chinese distrusted the motives which sent a Japanese expeditionary force to capture the German stronghold of Tsingtao; and distrust deepened into bitterness when the Japanese began to land troops at Lungkow, outside of the German concession, thus violating China's neutrality. While resentfully protesting, the Chinese government was too weak to oppose Japan by force; and on September 3 the Foreign Legations at Peking were informed that China would maintain her neutrality except in the area between Lungkow on the North and Kiaochow Bay on the South. Germany and Austria-Hungary remonstrated against the extension of the war zone outside of the German Concession, but the Chinese government simply disclaimed responsibility. As the operations against Tsingtao progressed, China had additional cause for complaint against Japan. The Chinese Press indignantly accused the Japanese invading army of seizing supplies without due compensation, of intruding upon private homes, of seizing the Customs House at Lungkow in order that Japanese merchandise might be admitted duty-free, and of needlessly occupying the railway stations at Weihsien and at Tsinanfu on Chinese territory. Still more aggravating was the opinion freely expressed in Japanese journals, that since Germany had forced Japan to fight for Tsingtao, Japan was no longer bound to hand over to China the territory for which Japanese soldiers had shed their blood. Japan must retain Kiaochow as compensation for her exertions. This was what Chinese opinion anticipated.

The war had also an important bearing upon Chinese finance. During the summer, just before the war broke out, the Chinese government had been counting upon a loan of \$40,000,000 from the Quintuple group of international bankers, but then the war intervened, cancelling loan projects and cutting down the customs revenues. On August 10 the Chinese government requested the Powers, in consideration of the war, to allow a postponement of the payments due to foreign governments (on the Boxer indemnity) and banks. In September the situation assumed a brighter aspect. A domestic loan of \$26,000,000 found ready subscribers in China, and the August installments of the Boxer indemnity were paid. Moreover it was rumored that a loan of \$50,000,000 had been negotiated with Messrs. Samuel of London, and that Wang Ching-fang and Tsai Shu-tung had been sent to

the United States on a financial mission. Upon the issue of these negotiations, and upon the ability of Yuan Shi-kai to utilize China's own financial resources, much depended; for without money to discharge its obligations, and without funds to pay the troops, Yuan Shi-kai's government could not hope long to continue in power. CHRISTIAN ENDEAVOR, UNITED SOCIETY OF. During the year 1914 the Christian Endeavor Week was inaugurated. This is the first week in February and it is a time for review and recruiting, and out of it has grown the "Help Out Church" movement, a definite effort to apply the power and enthusiasm of young people to the solution of problems of the church. During the year, also, the "Life Work Recruits," a movement to enlist young people for the ministry, missions, and other forms of definite Christian service, was developed, and nearly 1000 members were enrolled. The society through its State and district unions made the "Go-to-Church Sunday" a national movement, and largely contributed to its success. The society increased in number and effectiveness as a result of the efficient methods, which are applied with the same directness and system as in a business establishment. The society numbers over 4,000,000 members, with 75,000 different societies and 80 denominations.

CHRISTIANS. The total number of communicants in this denomination in 1913 was 112,902. The churches numbered 1182 and the ministers 1129. The highest representative body is the American Christian Convention, made up for the most part of delegates from the conferences. This organization has supervision of the general work of the denomination. The denomination maintains several schools and colleges, including the Union Christian College in Indiana, Defiance College in Ohio, Starkey Seminary in New York, Elon College and Franklinton Christian College (colored) in North Carolina, Palmer College and Weaubleau College in Missouri, and Jireh College in Wyoming. It has also a theological school, the Christian Biblical Institute, in Ohio. Missions are conducted in Japan, Porto Rico, continental United States, and Canada. Periodicals are the *Herald of Gospel Liberty*, the *Christian Sun*, and the *Christian Vanguard*.

CHRISTIAN SCIENCE. The most notable event of the year 1914 in the development of the Christian Science movement was the announcement by the trustees, under the will of Mary Baker Eddy, of their plan for using the income of her estate for the purpose named in her will. Mrs. Eddy bequeathed the bulk of her estate to be held and administered by trustees, with the provision that the income should be used for "more effectually promoting and extending the religion of Christian Science as taught by" her. The persons who were appointed to administer this trust are Archibald McLellan, Allison V. Stewart, John V. Ditte-

more, Adam H. Dickey, and James A. Neal,—directors of the First Church of Christ Scientist in Boston,—and Josiah E. Fernald, a banker of Concord, N. H., in whom Mrs. Eddy had shown confidence.

At the annual meeting of the Mother Church on June 8, 1914, the trustees announced that the income of her estate would be used chiefly as follows: 1. To contribute toward the expense of lectures given by Christian Science organizations outside the United States, Canada, and Great Britain. 2. To contribute toward the ever-increasing distribution of authorized literature throughout the world. 3. To contribute toward the establishment and maintenance of circulating or lending libraries of authorized Christian Science literature in connection with the denomination's churches, societies, reading-rooms, and Sunday schools. 4. To assist, in so far as is possible and practicable, in building church edifices.

The plan thus formulated has now been put into effect. Mrs. Eddy's work on Christian Science and her biography by Sibyl Wilbur were offered to public libraries throughout the United States and Canada, and furnished free of expense wherever accepted. Since the war began in Europe, large quantities of Christian Science literature have been supplied to the British fleet, German detention camps, various military hospitals, and to other places where participants in the war, reading English, German, or French languages, have been assembled. The trustees of Mrs. Eddy's will have also contributed to the expense of lectures in South Africa, New Zealand, Australia, China, the Philippine Islands, and Hawaii, these lectures having been delivered by members of the Christian Science Board of Lectureship, sent from the United States; other contributions have been devoted to the objects named in the plan to the extent of the income derived from Mrs. Eddy's estate. During 1914 the Christian Science movement, in number of adherents, number of churches, and in every respect, showed a steady and progressive development.

CITY PLANNING. Of the realization of city-planning projects during 1914, passing mention may be made of (1) marked progress in widening Michigan Ave., Twelfth St., and Canal St., which with Chicago Ave., already 100 feet in width, form the "quadrangle" in the Chicago City Plan; (2) the carrying forward of the group plan of public buildings in Cleveland and of civic centres elsewhere; and (3) notable waterfront and railway improvements at Albany. Some details of city-planning commissions, the proposed Canadian Town Planning Act, a few

competitions, and a projected American garden suburb follow.

PLANNING COMMISSIONS. One of the most encouraging features of the city-planning movement was the increasing number of official bodies commissioned to deal with city planning within the limits of the cities they represent. A list of cities having such commissions and a brief summary of mandatory legislation in Massachusetts and Pennsylvania, and permissive legislation in New York, providing for city-planning commissions, were given in the *INTERNATIONAL YEAR BOOK* for 1913. State supervision of these local commissions in Massachusetts was under the Homestead Commission. Cleveland, Ohio, which for some years past had been making steady progress with its civic centre, created a City Plan Commission with wide powers, by an ordinance approved May 14, 1914. The Commission consisted of seven members, appointed by the mayor to serve five-year terms without compensation. The members must have "knowledge and large experience" in one or more of the following subjects: architecture, landscape architecture, engineering, building, transportation, painting, sculpture, finance, commerce, industry, law, civic administration, social welfare, and real estate. The mayor at all times, and directors of city departments when matters concerning their departments are under consideration, may sit with the commission but cannot vote. The commission is directed to prepare plans for the physical development and improvement of the city, and all designs for and locations of public works of art, buildings, bridges, and other public structures. All maps and plans of land intended for public use must be approved by the commission as a condition of legality. The ordinance was drawn by a committee of the Cleveland Chapter of Architects in coöperation with Mayo Fesler, secretary of the Cleveland Civic League, and is summarized at greater length in *The American City* for July, 1914.

In New York City the Board of Estimate appointed from among its own members a Committee on City Plan consisting of George McAneny, President of the Board of Aldermen, as chairman and the five borough presidents. The Board of Estimate also appointed an Advisory Commission on City Planning, consisting of 25 members, with Charles D. Norton as chairman. Robert H. Whitten was secretary to both the committee and the commission. Mr. Norton was formerly secretary of the Chicago City Plan Commission.

PROPOSED CANADIAN TOWN PLANNING ACT. Like the United States, Canada has no power over city planning, but unlike the United States it has entered the city-planning field in an advisory capacity. Early in the year the Canadian Commission on Conservation (Ottawa; Ont.) had completed a tentative Town Planning Act for criticism. When perfected the act was to be submitted to the nine provincial legislatures for possible adoption, with variations to meet local conditions. As summarized in *Engineering News* of June 4, 1914, p. 1267: "Briefly, the bill provides for provincial town planning boards, under provincial departments of municipal affairs. These boards would consist of a 'town planning comptroller, who shall be a permanent paid executive officer, skilled in town planning and chairman of the board, and responsible to the minister' of municipal affairs, and of a number of

members of the provincial government serving ex-officio. The bill authorizes every municipal authority to create a local housing and town-planning board, consisting of the mayor, town engineer, medical health officer and not less than two ratepayers, preferably an architect and a financier. Municipal authorities adopting the act would also appoint a housing and town-planning commissioner, 'skilled in town planning,' who would be executive officer of the planning board and who would not be removable from office nor subject to reduction of salary without approval of the central planning board. The central authority, on its own motion or on petition of 10 or more municipalities, would have power to appoint a local planning board. Any local planning board would be a corporate body, with power to acquire, lease, or sell property, and to prepare and adopt a town-planning scheme, each of these two steps to be subject to the approval of the central planning board. No funds to carry out a town-planning scheme could be raised without the approval of the local city or town council. The principles of ordinary and of excess condemnation are embodied in the bill."

In the latter part of the year the Canadian Commission on Conservation secured as its Town Planning Adviser Thomas Adams, who has served the Local Government Board of England as Town Planning Inspector since the British Housing and Town Planning Act of 1909 went into effect.

COMPETITIONS. A number of planning competitions, chiefly minor in character but hopeful signs of the times, were held. Among these was a contest with 146 participants for laying out 350 acres of land on a new harbor at Richmond, Cal. A first prize of \$5000 and five prizes of \$1000 each were offered by the owner, H. C. Cutting, Monadnock Building, San Francisco. The subdivision was chiefly for docks and warehouses, business and industrial purposes, but a residential section was also provided. The first prize was awarded to Arthur C. Comey, Landscape Architect, Cambridge, Mass. Of the five other prizes three were won by engineers and two by landscape architects. The first and one of the other premiated designs and the verdict of the jury were published in *Engineering News* of June 25, 1914. A "four corners" competition was held under the Throop College of Technology, Pasadena, Cal. A "neighborhood centre" competition was begun by the City Club of Chicago, with a preliminary test to close on Nov. 9, 1914, and a final test on Jan. 25, 1915. An architectural competition for the Parliament House for the new Federal capital of Australia was announced, to close March 31, 1915. Prizes totaling \$6000 were offered. One of the judges composing an international committee was Louis H. Sullivan, an architect of Chicago.

THE BILLERICA GARDEN SUBURB. This project at Billerica, 21 miles from Boston, Mass., was organized to house employees in the new repair shops of the Boston & Maine Railroad. A 57-acre tract in a rural section was to be laid out by a company and provision was to be made for various plans of ownership and for rented dwellings. Consult *The American City*, July, 1914, for sketch plan and for description of scheme.

CONVENTIONS, SUMMER SCHOOL, AND EXHIBITS. The sixth annual Conference on City Planning

was held at Toronto, Ont., May 25 to 27. Much attention was given to waterfront development, the financing of city planning, and city transportation, including the motor bus. Frederick Law Olmsted, Brookline, Mass., was continued as chairman. The programme of the International Garden Cities and Town Planning Association provided for a meeting in London on July 9 and making a tour through England and Scotland. Ewart G. Culpin, 3 Grays Inn Place, London, W.C., was secretary. The second Summer School of Town Planning, held at the University of London School of Architecture, was attended by 45 students, of whom 18 were architects and 9 civil engineers and surveyors. There were 4 students from the United States, 1 from Canada, 1 from Italy, and 1 from Denmark. The opening day coincided with the declaration of the European War, or perhaps the attendance would have been larger. The town planning exhibit, collected with great pains by Prof. Patrick Geddes during a considerable period, was lost in the autumn on its way to India by the sinking of the *Clan Grant* by the German cruiser *Emden*.

Bibliography. *Modern City Planning and Maintenance*, by Frank Koester (New York); *Carrying Out the City Plan; The Practical Application of American Law in the Execution of City Plans*, by Flavel Shurtleff and Frederick Law Olmsted (New York); *An Introduction to Town Planning*, by Julian Julian, borough surveyor of Cambridge, England (London), deals chiefly with British town-planning laws and by-laws; *A List of American City-Planning Reports*, in *The American City* (New York), December, 1914, includes more than a hundred reports made since 1900 on city planning, civic centres, and the like in nearly a hundred cities. Many of these reports were listed in the INTERNATIONAL YEAR BOOK for 1913.

CIVIC ASSOCIATION, AMERICAN. The annual meeting of this association was held in Washington, Dec. 2, 3, and 4, 1914. The president, J. Horace McFarland, presided. Honorable Oliver P. Newman, president of the Board of District Commissioners, greeted the association in behalf of the District of Columbia. The annual address of the president was entitled, "Wanted—American City Planning for American Cities." Other addresses were "The Washington of To-day and a Vision of the Washington of To-morrow," Col. William W. Harts; "The Relation of the Nation to its Capital," Hon. Henry B. F. Macfarland; "Recreation for Congested Population," Mr. George A. Parker; "Consolidation of City and County Parks," Mr. Alfred C. Clas; "Children at Work in Gardens," Mrs. John T. D. Blackburn; "Our Surroundings and Their Influence," Mr. Arnold W. Brunner; "The Economic Basis of City Planning," Mr. Thomas Adams; "What Canada has done for its National Parks," Hon. J. B. Har-kin; and "Glacier National Park," by Clarence J. Blanchard. The officers of the association are J. Horace McFarland, president; treasurer, William B. Howland; secretary, Richard B. Watrous.

CIVIC CENTRES. See CITY PLANNING.

CIVIC FEDERATION, NATIONAL. The fifteenth annual meeting of the federation was held in New York City on December 4 and 5. There was a large attendance and many important matters relating to the work of the federa-

tion were discussed. President Seth Low stated in his annual address that the most important work completed within the year was the Draft bill prepared by the Executive Council of the Department on the Regulation of Public Utilities, which bill presents the results of a study of the problem carried on for more than two years by competent men. Progress was made in the social service of the Industrial Economics Department, which was begun in 1913. Important work during the year was also done by the Committee on Workmen's Compensation, the Committee on Welfare Work, and by the Committee on the Right of Free Speech, the work of the Woman's Department being especially effective. Among the important addresses delivered at the meeting were the following: "Shall the Government Own and Operate the Railroads, Telegraph and Telephone Systems and Public Utilities?" Jonathon Bourne, Jr.; "The Worker's Fair Share," George W. Perkins; "Municipalization or a Just Regulation," J. W. Sullivan; "The Trend toward Government Management of Business," Jeremiah W. Jenks; "Some Lessons We may Learn from the War," John Hays Hammond.

The meeting of the Woman's Department was held on December 3 at the Colony Club. Reports were made upon the year's work by the officers and the chairman of sections and committees; these included plans for rural improvements by the Country Life Committee; the problem of recreation resources and possibilities for workingwomen by the Vacation Committee; the special work of the Vacation War Relief Committee; and others. The phases of industrial, agricultural, and social problems toward which its activities are directed made the annual meeting of the Woman's Department of exceptional and vital interest. An interesting social feature of the meeting was the performance of the ballet *Pandora's Box* under the auspices of the Vacation Committee. The proceeds were devoted toward the administration expenses of the vacation and war relief funds.

The Employer's Welfare Department gave a reception in connection with the opening of its permanent welfare exhibit on the thirty-fourth floor of the Metropolitan Tower on December 3. There were shown moving picture films of the sociological work of the Ford Motor Company at Detroit, Mich., and the welfare work of the Government Bureau of Engraving and Printing at Washington. The officers of the federation in 1915 are president, Seth Low; vice-presidents, Samuel Gompers and Benjamin I. Wheeler; treasurer, Isaac N. Seligman; chairman of the executive council, Ralph M. Easley.

CIVIL SERVICE. FEDERAL CIVIL SERVICE. There were in the Federal service on June 30, 1913, 282,597 competitive positions, 121,804 excepted and noncompetitive positions, and 26,744 unclassified positions, forming a total of 431,145. Of these, 10,543 were positions calling for presidential appointment. The aggregate total salary paid to persons in these positions is estimated at \$400,000,000 a year.

Advocates of a strict civil service have found on a whole the attitude of President Wilson's administration favorable to that cause. Civil service law and rules have been well sustained by the President and the Civil Service Commission, except possibly in the matter of fourth-class postmasters. Executive orders providing

for limited competition in the appointment of consuls and diplomatic secretaries were adhered to during the year, with only five special exceptions made by the President, four being in favor of men qualified by experience and training. The annual appropriation bill for the Post Office Department, introduced into Congress in January, called for \$305,000,000, the largest sum ever required in one year for this purpose, and carried a rider depriving 2400 assistant postmasters of the safeguards of the merit system. Some of these men had gained and all held their positions under civil service regulations, but the passage of this rider would clear the way for their dismissal and for the appointment of untrained partisans in their places. In a minority report the Republican members of the committee characterized the use of riders on appropriation bills as a vicious policy, which the Democrats, while in the minority, had opposed, and the Civil Service Reform League, of which the President was formerly an officer, addressed to every member of the House a letter setting forth the objections to the proposed legislation.

The rider failed to pass, largely as a result of the attitude toward it adopted by President Wilson, who made known to the chairman of the committee that he was unalterably opposed to it. As this opinion foreshadowed a veto, the committee on rules declined to bring in a special rule by which the rider was to be considered part of the bill, but it cannot be denied that a disposition has been shown by Congress to limit the scope of the civil service law by rider legislation. A rider of this description, directing that the employees of the Federal Reserve Board might be appointed without complying with the requirements of the civil service law, was placed on the Banking and Currency bill and was adopted only by the vote of Vice-President Marshall, which broke a tie. Riders of a similar sort were placed in an Indian appropriation, and several other of the large appropriation bills. In the Trade Commission bill Congress exempted attorneys, special experts, and examiners of the new board from the operation of the law.

STATE AND MUNICIPAL CIVIL SERVICE. Charges made against the Civil Service Commission of New York were dismissed by Governor Glynn on December 29. These charges were filed by the Civil Service Reform Association and criticized in general the administration of the law. The high State Civil Service Commission on December 7 began a thorough investigation of the records of the Toledo Civil Service Commission. This investigation was made following the receipt of a large number of complaints that the city employees had been discharged without regard to the Civil Service law, in order to make room for political followers of the new administration. An effort was made in 1914 to secure the adoption of a State civil service law in Texas. The Cook County Civil Service Commission of Illinois underwent a complete reorganization during the year, three commissioners resigning.

CIVIL SERVICE COMMISSION. See CIVIL SERVICE.

CIVIL SERVICE REFORM LEAGUE, NATIONAL. The annual meeting of the league was held at Chicago, December 3 and 4, the address being delivered by the president, Richard H. Dana, who reviewed the work of the league dur-

ing the year and gave a resumé of civil service conditions in the National and State governments. The council of the league reported in general the constant growth of popular sentiment in favor of the merit and efficiency system. William B. Hale, vice-president of the Chicago Civil Service Reform Association, delivered an address, entitled "A Constructive Programme for the National Civil Service." George T. Keyes, secretary of the league, spoke on "Some Essential Features of a Model Civil Service Law." Resolutions were adopted calling attention to the efforts made by certain members of Congress to lessen the effect of the Civil Service law urging the classification of the higher administration officers, especially the collectors of customs and internal revenue and news marshals, and postmasters of the first, second, and third class. The officers of the league are, president, Richard Henry Dana; chairman of the council, Robert D. Jenks; secretary, George T. Keyes; assistant secretary, Harry W. Marsh; treasurer, A. S. Frissell.

CLARK COLLEGE. An institution for higher education at Worcester, Mass. The college is entirely independent in administration and endowment, although the same buildings are used for both Clark College and Clark University. There were in the several departments of the college in the autumn of 1914, 145 students, and a faculty numbering 24. There were several changes in the faculty during the year. No noteworthy benefactions were received. The productive funds of the college amounted to \$1,500,000, and the income to about \$70,000. The library contains about 70,000 volumes. The president of the college is Edmund C. Sanford, Ph.D.

CLARK UNIVERSITY. An institution for post-graduate study, founded at Worcester, Mass., in 1889. There were enrolled in the autumn of 1914, 94 students engaged in graduate work, and a faculty numbering 21. The endowment, including university, library, and art department amounted to \$2,400,000, and the annual income amounts to about \$100,000. The university library contains about 60,000 books and pamphlets. The president is G. Stanley Hall, Ph.D., LL.D. See **CLARK COLLEGE**.

CLASSICAL LITERATURE AND SCHOLARSHIP. See **PHILOLOGY, CLASSICAL**.

CLAYTON, POWELL. An American soldier and diplomat, died Aug. 25, 1914. He was born in Bethel, Pa., in 1833, and was educated in the public schools and at Partridge Mill Academy. After studying civil engineering he engaged in the practice of that profession until 1861, when he was appointed captain of the First Kansas Infantry. He served throughout the Civil War, rising to the rank of brigadier-general of volunteers. In 1865 he was honorably discharged from the service. After the war he removed to Arkansas, where in 1882 he built the Eureka Springs Railway. He also built several railway, water, and sewer systems in Arkansas. He was active in politics from the organization of the Republican party and from 1867 to the time of his death was a member of the State Central Committee of Arkansas. He was also a member of the Republican National Committee from 1872 to 1913, with the exception of about three years. From 1868 to 1871 he was Governor of Arkansas and was United States Senator from 1871 to 1877. He attended every Republican National

Convention from 1872 to 1912. From 1897 to 1905 he was American Ambassador to Mexico. He retired from active participation in politics in 1905.

CLAYTON ANTI-TRUST BILL. See **TRUSTS; UNITED STATES, Congress**.

CLAY-WORKING INDUSTRIES. The clay-working industries were on the whole prosperous in 1913. The total value of all clay products marketed in that year was \$181,289,132, compared with \$172,811,275 in 1912. Of the two great divisions of the industry, brick and tile, and pottery, the former showed the larger increase, both actual and proportionate. The increase in the brick and tile industry was \$6,989,646, or 5.13 per cent. The increase in the pottery industry was \$1,468,211, or 4.08 per cent. The most prominent features in the industries in 1913 were the large decrease in the production and value of common brick in the region supplying the New York market and in the value of vitrified brick, sewer pipe, fireproofing, and fire brick. The growing use of hollow tile not only in fireproof construction in the larger buildings, but also in dwelling houses and other small structures, is shown in the large and continued increase in the value of this material. The vitrified paving brick industry had the most satisfactory year it has yet experienced. The value of brick and tile produced in 1913 by the four States leading this industry was \$22,185,383 for Pennsylvania; \$21,868,407 for Ohio; \$14,280,611 for Illinois; and \$10,866,833 for New Jersey. The value of pottery produced in 1913 by the same States, which held supremacy for this as well as for brick and tile, was for Ohio \$38,388,296; for Pennsylvania \$24,231,482; for New Jersey \$19,705,378; and Illinois \$15,195,874.

In the brick and tile industry decrease was shown in the quantity and value of common brick and in the value of fancy or ornamental brick and of architectural terra cotta. The decrease in the quantity of common brick was 466,448,000, or 5.45 per cent. In the pottery industry every variety of ware except one showed an increase, and the year was one of notable progress in every way. The new tariff law which will have a much greater influence on the pottery industry than on the brick and tile industry, both in raw material and on the finished product, went into effect so late in the year that it had little or no apparent result.

A notable feature of the clay-working industries was the tendency toward the concentration of the industry into fewer and larger units, chiefly by the elimination of the smaller temporary plants, though considerable consolidation also was going on. In 1914, the curtailment of building operations was reflected in the decreased output of common brick in the eastern part of the United States, particularly at yards along the Hudson and Hackensack rivers, and the same was true to a considerable extent in other localities.

CLUB BUILDINGS. See **ARCHITECTURE**.

COAL. The total production of coal in the United States in 1913 was 570,048,125 short tons, valued at \$760,483,785. Of the coal produced, 81,718,680 long tons, valued at \$195,181,-

127, was Pennsylvania anthracite, and 478,523-203 short tons, valued at \$565,307,658, was bituminous and lignite coal. The production in 1913 was an increase of 6.7 per cent over that of 1912. The higher values in 1912 were not only maintained but generally improved upon in 1913. The general average value per ton showed an advance of 3 cents over 1912, and reaching within 8 cents of the record high average of 1903. A notable exception to the higher prices obtained in 1913 among the more important producing States was in Illinois, where, because of peculiar local conditions, the average value showed a decline. The total value of the combined production of anthracite and bituminous coal in 1913 was \$760,488,785, compared with \$695,606,071 in 1912. The production of anthracite in Pennsylvania increased from 75,322,855 long tons, valued at \$177,622,626 in 1912, to 81,718,680 long tons, valued at \$195,181,137 in 1913. (For a discussion of the production of coal in Pennsylvania, see PENNSYLVANIA.)

Increases in bituminous production were generally distributed over the country, there being only six States where the production in 1913 was less than in 1912, and in one of these States, Colorado, the decrease was due entirely to labor troubles. During the first nine months of the year the activity in the iron and steel trades which had developed in 1912 was well maintained and created activity in the coking-coal districts. This fell off somewhat sharply during the last quarter of the year, but the demands from other lines of manufacture and from the railroads was well sustained. In the Central and Southwestern States the production of coal was stimulated through the continued decrease in the production of natural gas in the northern part of the mid-continent field and the withdrawal of large quantities of fuel oil from the markets. There was some complaint

of labor shortage, but in that respect also there was an improvement compared with 1912, as many of the mine workers who had returned to Europe to enlist in the Balkan War resumed their places in the coal mines throughout the country and especially in the Western States.

The largest increase in the production of bituminous coal was in Pennsylvania. West Virginia showed the second largest gain. The significant increase of the year, however, was in Kentucky, which showed the third largest gain and the largest percentage of increase among the important coal-producing States. Indiana came fourth, Illinois fifth, Ohio sixth, and Alabama seventh in the increase in production. As just noted the only important State to show a decrease was Colorado, whose production fell off nearly 1,750,000 tons on account of labor troubles. One State, Wyoming, showed an increase in production and a decrease in value, and one State, Maryland, had a decrease in quantity of output and an increase in value.

The coal mines of the United States in 1913 gave employment to an average of nearly three-quarters of a million men. As none of the wage agreements between employers and miners terminated in that year there was no general suspension among the organized miners, although two desperate struggles to force the recognition of union men were carried on, one in Kanawha field in West Virginia and the other in Colorado. (For a discussion of these troubles, see STRIKES.)

COAL-MINE ACCIDENTS. The fatalities in the coal mines in the United States in 1913 showed an increase over the preceding year. In 1913 2785 men were killed, compared with 2360 in 1912. Of the total number of fatalities in 1913, 618 were in the anthracite mines of Pennsylvania and 2167 in the bituminous and lignite mines. As is usually the case the most prolific cause of death was falling roofs and coal which claimed 1264 victims, or 45.4 per cent of the

QUANTITY AND VALUE OF COAL PRODUCED IN THE UNITED STATES, 1912-1913. IN SHORT TONS.

State	1912		1913	
	Quantity	Value	Quantity	Value

Total bituminous	450,104,982	517,983,445	478,523,203	565,307,658
Pennsylvania anthracite	84,861,598	177,622,626	91,524,922	195,181,127
Grand total	534,466,580	695,606,071	570,048,125	760,488,785

total number of deaths. In 1912 the deaths due to falling roofs and coal were 1151, or 48.8 per cent of the total. The increase in the number of fatalities in 1913 over the preceding year was due chiefly to three explosions of dust in the bituminous mines, the worst of which was a disastrous explosion at Dawson, N. Mex., in October, the immediate result being the death of 261 mine employees. Next to this in the number of men killed was the explosion of the Cincinnati mine in Washington Co., Pa., which occurred in April and resulted in the death of 96 men. Mine cars and locomotives underground killed 424 men in 1913, against 362 in 1912. Premature blasts and other accidents incident to the use of explosives killed 138 men in 1913 and 133 in 1912. The total number of fatal accidents underground increased from 2119 in 1912 to 2562 in 1913.

COAL CONSUMPTION. More than 95 per cent of the total production of anthracite and bituminous coal in the United States is consumed within the country, although the efforts to build up an export trade, particularly for the high-grade bituminous coals, has resulted in a considerable expansion of business done with foreign countries. The total quantity of coal exported in 1913 was 24,798,080 short tons, compared with 20,326,619 in 1912. The imports in 1913 amounted to 1,583,560 short tons. The accompanying table shows the quantity and value by States of the coal produced in 1912 and 1913.

WORLD'S PRODUCTION. The accompanying table shows the world's production of coal for the latest year available. The figures for foreign countries were compiled by Mr. William G. Gray, statistician of the American Iron and Steel Institute. For the sake of convenience the quantities are expressed in the measurement customary in each country and reduced for purposes of comparison to the short ton of 2000 pounds.

PRODUCTION IN 1914. According to estimates made by the United States Geological Survey, the production of coal in the United States in 1914 was about 510,000,000 short tons, a decrease of about 60,000,000 tons compared with the record output of 1913. Practically all of this decrease was in the output of bituminous mines. The production of Pennsylvania anthracite was not materially different from that of the preceding year. The principal decreases in the production of bituminous coal were in the coking districts. It is estimated that in Pennsylvania alone the bituminous coal output decreased between 20,000,000 and 25,000,000 tons. West Virginia, on the contrary, on account of different conditions, showed an increase in production over 1913. Among the Eastern States Ohio showed the largest proportion of decrease, for in addition to the depressed condition of business the labor controversies in the eastern part of the State kept a number of mines idle for practically the entire year. The effect of the war upon the coal trade in the opinion of the authorities was to retard or to prevent the return to more normal conditions which was about to be accomplished when the war broke out. As usual in times of depression and of decreased production, there was a plentiful supply of labor throughout the bituminous coal-mining region during the entire year, and for the same reasons there was no complaint of inadequate transportation facilities.

COCAINE AND OPIUM HABIT. The crusade against cocaine and other habit-forming drugs was very active in New York City. Professional peddlers of the drug were found to be numerous and some of them were accused of sell-

ing cocaine, heroin, and opium to school children in Brooklyn. More than 500 packages of the drugs were seized, and it was alleged that they were sold on the street corners for as little as five cents. The Boylan law, designed to establish stricter control of the sale and use of habit-forming drugs in New York State, was a Chapter of the Public Health Law, becoming effective on July 1, 1914. The law provided that no person shall sell at retail or give away any chloral or opium, or any preparation containing these drugs or their derivatives, except upon the written prescription of a physician, veterinarian, or dentist. By Section 245 of the law, domestic and proprietary remedies, however, are exempted from these provisions, unless they contain more than a given amount of the prohibited drug. The law does not apply to plasters, liniments, and ointments for external use. Where prescriptions call for more than 4 grains of morphine, 30 grains of opium, 2 grains of heroin, 6 grains of codeine, or 4 grains of chloral, they may not be filled until the correctness of the prescription has been verified by telephone or otherwise. Possession of any of the designated drugs by other than a duly authorized person is a misdemeanor. A section (249) regulates the sale of hypodermic needles and syringes, while another provides for

the commitment of habitual users of the prohibited drugs to State, county, or city institutions licensed by the State Hospital Commission.

COE, EDWARD BENTON. An American clergyman of the Dutch Reformed Church, died March 19, 1914. He was born in Milford, Conn., in 1842, and graduated from Yale College in 1862. He studied theology at the Union Theological Seminary, and in France and Germany. From 1864 to 1879 he was Street professor of modern languages at Yale. He was ordained to the ministry of the Reformed Church in America in 1879. From that year until his death he was minister of the Collegiate Church of New York. In 1898 he was president of the General Synod of the Reformed Church in America. He was the author of *Life Indeed* (1899), and numerous sermons and addresses. He received the degrees of D.D. and LL.D. from Rutgers College, and the degree of S.T.D. from Yale.

COINAGE. See **UNITED STATES.**

COINS, VALUE OF. The following table gives the value of foreign coins in the currency of the United States, on Dec. 31, 1914.

Country	Standard	Monetary Unit	Value in U. S. Gold Dollar	Remarks
Argentina	Gold	Peso	\$0.96,5	Currency: depreciated paper, convertible at 44 per cent of face value.
Austria-H.	Gold	Crown	.20,8	
Belgium	Gold	Franc	.19,3	Member of Latin Union; gold is the actual standard.
Bolivia	Gold	Boliviano	.88,9	12 1/2 bolivianos equal 1 pound sterling.
Brasil	Gold	Milreis	.54,6	Currency: Government paper. Exchange rate about \$0.25 to the milreis.
British Colonies in Australia and Africa	Gold	Pound sterling	4.86,65	
Canada	Gold	Dollar	1.00,0	
Cent. American States:				
B. H'nd's	Gold	Dollar	1.00,0	
Coa. Rica	Gold	Colon	.46,5	Currency: inconvertible paper, exchange rate 16 to 18 pesos—\$1.00.
Gua'mala	Silver	Peso	.89,8	Currency: bank notes.
Hond'ras	Silver	Peso	.89,8	Currency: convertible into silver on demand.
Nica'gua	Gold	Cordova	1.00,0	Currency: inconvertible paper; exchange rate, approximately, \$0.14.
Salvador	Silver	Peso	.89,8	
Chile	Gold	Peso	.86,5	
China	Silver	Tael	{ Shanghai .59,6 Haikwan .66,4 Canton .65,0	
Colombia	Gold	Dollar	1.00,0	Currency: inconvertible paper; exchange rate, approximately, \$102 paper to \$1 gold.
Denmark	Gold	Crown	.26,8	
Ecuador	Gold	Sucre	.48,7	The actual standard is the British pound sterling, which is legal tender for 97 1/2 piasters.
Egypt	Gold	Pound (100 piasters)	4.94,8	Member of Latin Union; gold is the actual standard.
Finland	Gold	Mark	.19,3	
France	Gold	Franc	.19,3	Member of Latin Union; gold is the actual standard.

Remarks

Currency: depreciated paper, exchange rate, 1,550 per cent.

This is the value of the gold kran. Currency is silver circulating above its metallic value; exchange value of silver kran, approximately, \$0.08,75.

Currency: inconvertible paper; exchange rate, approximately, \$0.98,94.

Valuation is for the gold peseta; currency is silver circulating above its metallic value; exchange value, approximately, \$0.17,94.

Member Latin Union; gold is actual standard. 100 piasters equal to the Turkish £.

COKE. The production of coke in the United States in 1913 exceeded all previous records both in quantity and value, and amounted to 46,299,530 short tons, valued at \$128,922,273, compared with 43,983,599 short tons, valued at \$111,805,113 in 1912. The statistics for 1913 established a new record not only in quantity and value of output but in the average value per ton for the product. Of the total quantity made in 1913, 33,584,830 tons were beehive or "oven" coke, valued at \$80,284,421, and 12,714,700 tons, valued at \$48,637,852 were by-product or "retort" coke. The coal consumed in the manufacture of coke in 1913 was 69,239,190 short tons, valued at \$100,561,439. Of the 15 coke-producing States for which statistics may be separately published, there were nine in which the production increased in 1913 and six in which the output decreased. Somewhat more than half the total increase was in Pennsylvania. The largest percentage of increase was in Kentucky, whose output showed a gain of 125,529 short tons, or 65.5 per cent, largely due to the operations of the new plant of Semet-Solvay ovens at Ashland. The second State in quantity of increase was Alabama, which gained 348,175 short tons, and in this State also the gain was altogether in the output of by-product coke. Virginia, whose production was entirely from beehive ovens, showed a gain of 335,656 short tons. The principal decreases in the production of coke in 1913 were shown by Colorado and Ohio, the former being due to labor disturbances, and the second to floods in the spring and droughts in the summer and early fall. The accompanying table shows the production of coke by States in 1912 and 1913.

QUANTITY OF COKE PRODUCED IN THE UNITED STATES, 1912-1913, BY STATES, IN SHORT TONS.

State	1912	1913
Alabama	2,975,489	3,323,664
Colorado	972,941	879,461
Georgia	43,158	42,747
Illinois	1,764,944	1,859,553
Indiana	2,616,339	2,727,025
Kansas	(a)	(a)
Kentucky	191,555	317,084
New Jersey	270,429	255,792
New Mexico	418,906	467,945
New York	794,618	758,486
Ohio	888,669	851,846

State	1912	1913
Pennsylvania	27,438,693	28,753,444
Tennessee	370,076	364,578
Utah	(a)	(a)
Virginia	967,947	1,803,608
Washington	49,260	76,221
West Virginia	2,465,986	2,472,752
Other States	2,259,589	2,845,829
Total	43,983,599	46,299,530

(a) Included with other States having less than three producers.

The total number of coke ovens in existence on Dec. 31, 1913, was 102,650. Of this number 55,058 were in Pennsylvania. Pennsylvania ranks first in the production of coke, with Alabama second, Indiana third, West Virginia fourth, and Illinois fifth. If all the coke made from West Virginia coal were produced in that State it would occupy second place, as by far the larger part of the coke manufactured in Ohio, Indiana, and Illinois is from West Virginia coal. The total quantity of coke imported and entered for consumption in the United States in 1913 was 101,212 short tons, valued at \$435,157, and the quantity exported was 987,395 short tons, valued at \$3,309,930.

COLD STORAGE. See FOOD AND NUTRITION; and STOCK RAISING.

COLGATE UNIVERSITY. An institution for higher education, founded at Hamilton, N. Y., in 1819. The students enrolled in the several departments in the autumn of 1914 numbered 518, and the faculty numbered 47. There were no notable changes during the year. The only noteworthy benefaction was one of \$5000 for the foundation of scholarships. The productive funds amount to about \$2,000,000 and the annual income to about \$90,000. The library contains 80,000 volumes. The president is Elmer Burritt Bryan.

COLLEGES. See UNIVERSITIES AND COLLEGES.

COLLEGES, AGRICULTURAL. See AGRICULTURAL EDUCATION.

COLLISIONS. See RAILWAY ACCIDENTS.

COLOMBIA. A republic of northwestern South America. The capital is Bogotá.

AREA AND POPULATION. The area of the republic cannot be stated with any degree of accuracy on account of unfixed boundaries. The

boundary with Brazil is undefined, and a large extent of territory claimed by Colombia is also claimed by both Ecuador and Peru. Naturally the estimates of area differ widely; one is 465,700 square miles (equivalent to 1,208,200 square kilometers given in the table below); another, which probably more nearly approximates the eventual area of the country, is 435,100 square miles. The division of the republic into departments has been repeatedly altered in recent years, and the figures for departmental areas given in the table must not be regarded as definitive; no attempt is made to state the areas of the several intendencies and commissaries. The census of March 5, 1912, showed a total population of 5,472,604, but this figure includes an estimated 400,000 for Panama, whose independence Colombia had not recognized. For the intendencies and commissaries, the census showed a total population of 231,522; but this figure included estimates aggregating 94,000 mostly uncivilized Indians. As compared with the total of 5,472,604 in 1912, the reported population in 1905 was 4,533,777; in 1871, about 2,951,000; in 1851, about 2,243,000; in 1835, about 1,686,000. The following table shows population, according to the 1912 census, and, in square kilometers, the estimated departmental areas:

Departments	Sq. Km.	Pop.	Capitals
Antioquia ...	63,200	740,987	Medellín.
Atlántico	2,800	114,887	Barranquilla.
Bolívar	62,000	420,730	Cartagena.
Boyacá	45,728	586,499	Tunja.
Caldas	20,500	341,198	Manizales.
Cauca	56,675	211,756	Popayán.
Cundinamarca ..	22,850	718,968	Bogotá.
Huila	22,500	158,191	Neiva.
Magdalena ..	58,000	149,547	Santa Marta.
Nariño	26,000	292,535	Pasto.
Norte de Santander ..	17,374	240,381	Cúcuta.
Santander	49,626	400,084	Bucaramanga.
Tolima	22,000	282,426	Ibagué.
Valle del Cauca	10,825	217,159	Calí.
Intendencias:			
Meta		29,809	Villavicencio.
Chocó		68,127	Quibdó.
Commissaries:			
La Guajira ..		53,018	Puerto Estrella.
Arauca		4,922	Arauca.
Ocaquetá		24,548	Florencia.
Putumayo		31,380	Mocoa.
Vaupés		5,545	Calamar.
Urabá		6,476	Acandí.
Juradó		8,207	Pizarro.
Lazarettos ..		6,798	
Colombia ..	1,206,200	5,072,604	Bogotá.

The larger towns, according to the 1912 census, include the following (the figures relate to *municipios*, that is, districts which are organized for municipal purposes and which usually include a rather extended rural area): Bogotá, 121,257; Medellín, 71,004; Barranquilla, 48,907; Cartagena, 36,632; Manizales, 34,720; Sonrón, 29,346; Pasto, 27,760; Cali, 27,747; Aguadas, 26,423; Ibagué, 24,693; Palmira, 24,312; Neiva, 21,852; Montería, 21,521; Yarumal, 21,250; Cúcuta, 20,364; Bucaramanga, 19,735; Miraflores (Boyacá), 19,150; Llorica, 19,005; Popayán, 18,724; Cartago, 18,618; Pereira, 18,428; Andes, 18,391; Salamina, 18,195; Fredonia, 18,176; Bolívar (Cauca), 17,178; Abejorral, 17,508; Santa Rosa de Cabal, 17,009; Ocaña, 16,814; Riosucio, 16,506; Carmen (Bolívar),

16,332; Espinal, 16,274; Libano, 16,186; Sabanalarga (Atlántico), 16,042; Quibdó, 15,756; Santa Rosa (Antioquia), 15,754; Ituango, 15,246; Jericó (Antioquia), 15,191; Mompós, 14,703; Sogamoso, 14,647; Sincelejo, 14,021; Tiritibí, 13,724.

The following table shows by departments the number of males and females and of males able to read (Lit. males):

	Males	Females	Lit. males
Antioquia	857,302	888,685	122,500
Atlántico	54,989	59,948	19,423
Boyacá	276,551	309,948	46,486
Bolívar	205,080	309,948	46,486
Caldas	170,495	170,703	59,275
Cauca	103,468	108,288	21,344
Cundinamarca	388,472	375,496	89,692
Huila	73,689	84,502	15,481
Magdalena	70,608	78,989	
Nariño	142,099	150,486	40,415
Norte de Santander ..	99,482	104,899	25,851
Santander	191,898	208,686	67,958
Tolima	136,191	146,285	26,175
Valle del Cauca	104,705	112,454	28,131
	2,324,489	2,509,819

EDUCATION. Primary instruction is free, but not compulsory. According to the most recent report available, primary schools number 4075, with 292,058 pupils. Secondary education is directed largely by the religious orders. There are over 20 normal schools and a few institutions for special or professional education. Bogotá has long been a conspicuous seat of Roman Catholic scholasticism. Its university, founded in 1572, has faculties of letters and philosophy, jurisprudence and political science, medicine and natural science, and mathematics and engineering. Besides the University of Bogotá, there are several so-called universities, as the University of Medellín, the University of Cauca, at Popayán, founded 1910, and the University of Magdalena, at Santa Marta, founded 1913. The State religion is Roman Catholicism.

PRODUCTION. Colombia has a vast amount of fertile soil, but only a small proportion is under cultivation. Progress in agriculture, mining, and other industries is handicapped by inadequate means of transportation. The leading crop commercially is coffee. Other important products of the soil are bananas, rubber, ivory, nuts, cacao, sugar-cane, cotton, tobacco, and cereals. In some parts of the country, cattle raising is a large and profitable industry. There are large mineral resources, especially in the department of Antioquia, including gold, copper, lead, zinc, mercury, iron, platinum, salt, and emeralds. There are few manufactures, but the Panama hat industry is developing rapidly.

Imports and exports have been valued as follows:

	1910	1911	1912	1913
Imps. \$	17,025,637	\$18,108,863	\$23,964,623	\$28,585,800
Exps. \$	17,625,153	22,375,899	82,221,746	84,815,800

Leading imports in 1912 and 1913 respectively, in thousands of dollars: textiles 10,547 and 11,455; metals, 2917 and 3164; foodstuffs and condiments, 3055 and 2817; railway cars, carriages, wagons, etc., 1032 and 1164; liquors and other beverages, 836 and 1051; drugs and medicines, 838 and 947. The principal exports are shown in the following table:

	1911	1912	1913
Coffee	\$9,475,449	\$16,777,908	\$18,269,768
Gold	3,751,682	4,610,078	4,100,115
Cattle hides ..	1,779,790	2,261,722	3,180,782
Bananas	2,172,000	1,996,999	3,059,867
Panama hats ..	1,088,821	1,174,641	960,862
Tobacco	382,955	442,461	921,100
Ivory nuts	789,419	754,708	819,422
Platinum	845,896	594,188	588,995
Rubber	900,886	736,427	378,210

The value of the trade by countries is shown below, in thousands of dollars:

	Imports		Exports	
	1912	1913	1912	1913
United States	7,612	7,630	15,888	18,862
United Kingdom	7,839	5,887	4,376	5,566
Germany	4,201	4,012	1,854	3,216
France	2,012	4,409	625	798
Belgium	571	499	...	594
Italy	597	726
Spain	477	...	808	...
Total, includ. other.	28,965	28,586	32,222	34,816

In 1913, the total exports classified as vegetable products were valued at \$23,975,300 (of which \$12,903,500 to the United States); mineral products, \$5,514,600 (\$3,442,800); animal products, \$3,362,700 (\$1,543,500); manufactured products, \$1,017,100 (\$800,600); live animals, \$85,800 (\$2400); miscellaneous, \$48,700 (\$9000).

COMMUNICATIONS. Inland traffic is carried on to a considerable degree by means of the Magdalena River and its tributaries. Railway facilities are most inadequate. The railways form no continuous system, but consist of various short lines engaged in local traffic. Recent statistics are not available; the total length in operation at the end of 1911 was reported at 1000 kilometers. There was some railway construction during the following three years. Two lines were under construction in 1914 in the southwest part of the country, one from the port of Buenaventura to Cali and one from Cali to Popayán. The latter line (about 150 kilometers) was not expected to be open to traffic before the autumn of 1916. Reported length of telegraph lines, over 19,000 kilometers; post offices, over 600.

FINANCE. The gold dollar, or peso, is equivalent to the American dollar; the silver peso fluctuates with the price of silver; the legal value of the paper peso is one cent, but the actual value fluctuates somewhat. Reported budgets have been as follows: 1911, revenue \$12,685,119 and expenditure \$12,685,119; 1912, \$12,043,145 and \$12,500,000; 1913, \$14,070,652 and \$14,060,294; 1914, \$16,500,000 and \$16,115,000. Of the estimated receipts for 1913, customs were credited with \$10,050,370. The largest estimated disbursements were for war, \$3,285,032, and public debt, \$3,015,986. Public debt: Foreign consolidated (Jan. 1, 1912), £2,486,000 (in addition, guarantee railway debts amounting to £1,469,400); internal (July 1, 1912), 5,476,888 pesos silver; floating, \$2,756,545. In addition, there is an enormous outstanding paper currency.

GOVERNMENT. The executive authority is vested in a President, who is elected by direct vote for a term of four years and is assisted by a cabinet of eight members. The legislative power rests with a Congress of two houses, the Senate (35 members, elected indirectly for four years) and the House of Representatives (92

members, elected for four years by direct vote). For the term ending Aug. 7, 1914, the President was Carlos E. Restrepo. For the following term, José Vicente Concha was elected on Feb. 9, 1914, receiving nearly 301,000 votes, or about 90 per cent of the votes cast. The Congress elects for one year a first and a second *designado*, one of whom succeeds to the presidency in case of the President's death or incapacity.

ARMY. Colombia has a national army whose strength is determined by Act of Congress and every citizen is liable for military service, but beyond supplying a force of about 6000 or 7000 few recruits are required, though on a war basis the forces could be raised to some 50,000.

HISTORY. At the beginning of the year, Dr. José Llorente was appointed Secretary of the Treasury to succeed Francisco Restrepo Plata, who went to London as the financial agent of the Colombian government. The presidential elections on February 9 resulted in the election of Don José Vicente Concha (Clerical-Conservative). The President-elect was inaugurated August 15. He appointed the following cabinet: interior, Sr. Miguel Abadía Méndez; war, Isaias Luján; finance, Bernardo Escobar; treasury, Daniel J. Reyes; education, Emilio Ferrero; public works, Aurelio R. Acosta; commerce and agriculture, Jorge E. Delgado; foreign affairs, Marcos F. Suárez. In March the Minister of Foreign Affairs issued a *communiqué* denying that the United States had exercised pressure to force the withdrawal of the Pearson concession project in 1913 (see the NEW INTERNATIONAL YEAR BOOK for 1913). A discussion of the treaty negotiated between the United States and Colombia will be found in the article on the UNITED STATES. Although there continued to be expressed a bitter resentment against the United States for having robbed Colombia of Panama, there was no little satisfaction at the prospect of receiving \$25,000,000 and of acquiring special privileges in respect of the Panama canal. Taking advantage of the presumably more favorable spirit which the treaty had created in Colombia, an American "scientific mission" was sent to spend eight years and \$400,000 exploring the country, probably with a view to the discovery of business opportunities for American capital. The contract to deepen and widen the Bocachica entrance to the bay of Cartagena was awarded to the English firm of Pearson & Son. In regard to the enforcement of Colombia's neutrality in the war, see the article on the WAR OF THE NATIONS, section *Neutral Nations*.

COLON. See PANAMA CANAL.

COLORADO. **POPULATION.** The estimated population of the State on July 1, 1914, was 909,537. The population in 1910 was 799,024.

AGRICULTURE. The area, production, and value of the principal crops in 1913-14 are shown in the following table. The figures are from the United States Department of Agriculture, and those of 1914 are estimates only.

		Acreage	Prod. Bu.	Value
Corn	1914	462,000	10,626,000	\$6,376,000
	1913	420,000	6,800,000	4,599,000
Wheat	1914	475,000	11,312,000	9,842,000
	1913	460,000	9,680,000	7,551,000
Oats	1914	325,000	18,000,000	6,850,000
	1913	305,000	10,675,000	4,697,000
Rye	1914	21,000	868,000	289,000
	1913	20,000	840,000	304,000

		<i>Acresage</i>	<i>Prod. Bu.</i>	<i>Value</i>
Barley1914	103,000	8,966,000	2,181,000
	1913	100,000	8,250,000	1,820,000
Potatoes1914	78,000	8,760,000	4,880,000
	1913	80,000	9,200,000	5,980,000
Hay1914	970,000	2,328,000	17,227,000
	1913	890,000	1,824,000	18,240,000
a Tons.				

MINERAL PRODUCTION. Colorado ranks eleventh among the mineral-producing States and fifth among the States west of the Mississippi River. It is the leading producer of tungsten ores and vanadium minerals, and in the production of gold is surpassed only by California. It is third in the production of zinc, and fourth in lead and fluorspar. The product of chief value is gold, the production of which in 1913 was almost exactly one-third the total value of the mineral products of the State. Of the total gold output, more than one-half is mined in Teller County, all from deep mines and all from siliceous ores unmixed with other metals. The other important producing counties are San Miguel, Ouray, Lake, San Juan, Gilpin, and Clear Creek. The production of gold decreased from 899,222 fine ounces, valued at \$18,588,562, in 1912, to 877,857 fine ounces, valued at \$18,146,916 in 1913. Coal is second in importance among the State's mineral products. On account of labor troubles in the last quarter of the year, the production of the State decreased from 10,977,824 short tons, valued at \$16,345,336 in 1912, to 9,232,510 tons, valued at \$14,035,090 in 1913. The coal production of the State in 1914 is estimated to be about 1,000,000 tons less than in 1913. The production of zinc, which showed a marked increase in 1912 over 1911, suffered a decrease in 1913, which was particularly emphasized in the value of the output. The recoverable zinc content of the ores mined in 1913 was 59,673 short tons, valued at \$6,683,400, compared with 66,111 tons, valued at \$9,123,374 in 1912. According to the estimates of the United States Geological Survey, the mines of Colorado yielded in 1914, \$19,860,000 in gold, 8,742,000 ounces of silver, 75,550,000 pounds of lead, 6,877,000 pounds of copper, and 96,000,000 pounds of zinc, with a total value of \$33,300,000 compared with a total of \$35,450,585 in 1913. The estimates show an increase of \$1,713,000 in gold and decreases of 583,000 ounces in silver, 12,348,000 pounds in lead, 551,000 pounds in copper, and 23,350,000 pounds in zinc. In addition to the decrease in quantities of silver and the base metals, the falling off in average value for these metals caused a decrease in value of \$833,000 for silver, \$921,000 for lead, and \$1,890,000 for zinc. Colorado leads all the Western States in the manufacture of pig iron, but produces only a small quantity of iron ore. The ore from which the iron is made in Colorado is mined chiefly in New Mexico and Wyoming, and the value of the pig iron in the State is not included in the total mineral production. Silver ranks fourth in the value of mineral products, and, unlike gold, showed an increase in output in 1913. The silver production is chiefly from dry and siliceous gold and silver ores and from silver-lead ores. The production of silver increased from 8,212,070 fine ounces, valued at \$5,050,423, in 1912, to 9,325,255 fine ounces, valued at \$5,632,454 in 1913. The recoverable lead content of the ores mined increased from 37,621 short tons, valued at \$3,

385,902, to 43,949 short tons, valued at \$3,867,502. The other mineral products which had a total value in excess of \$1,000,000 were clay products and copper. The output of the stone quarries exceeded that amount in 1912, but fell slightly below it in 1913. Other mineral products of commercial value are cement, fuller's earth, gems, graphite, gypsum, lime, manganese ore, mica, mineral waters, natural gas, petroleum, sand and gravel, and sand-lime brick. On account chiefly of the decreased production of coal and zinc the total value of the mineral products of Colorado decreased from \$58,167,399 in 1912 to \$54,294,281 in 1913.

TRANSPORTATION. The total railway mileage in the State for the year ending Dec. 31, 1914, was 5579. Of this, 4255 was standard gauge, and 1323 was narrow gauge. The roads having the longest mileage of standard gauge track are as follows: Denver and Rio Grande, 986; Union Pacific, 587; Atchison, Topeka and Santa Fe, 512. The Denver and Rio Grande had also 592 miles of narrow gauge and the Colorado and Southern had 548 miles of narrow gauge. The only construction during the year was done by the Denver and Salt Lake Railroad Co., which began operation during December, 1913, with 40 miles of new track from Steamboat Springs to Craig.

FINANCE. The funded debt of the State on Nov. 30, 1912, consisted of two series of bonds, both issued for funding purposes—one to fund indebtedness of the State incurred in suppressing the Leadville riots and protecting the State during the years 1896 and 1897, the other for the purpose of redeeming the outstanding certificates and other evidence of indebtedness resulting from the insurrection of 1903 and 1904. The per capita debt in 1912 was \$3.70. The receipts from all sources for the fiscal year 1913 amounted to \$3,580,445, and the disbursements for the same period \$3,837,423.

CHARITIES AND CORRECTIONS. The charitable and correctional institutions of the State include the State Home for Children, Soldiers' and Sailors' Home, Workshop for the Blind, State Hospital for the Insane, State Home for Mental Defectives, Boys' Industrial School, Girls' Industrial, State Penitentiary, and State Reformatory. The Legislature appropriates annually about \$1,000,000 for the support and improvement of these institutions.

POLITICS AND GOVERNMENT. There was no regular session of the State Legislature in 1914, as the sessions are biennial and the last was held in 1913. There was, however, a special session called in May to attempt to deal with the mine strike situation. The troubles in the southern coal fields of the State, which are discussed more fully in the article STRIKES, took on a national importance during the year as a result of the apparent inability of the State authorities to control the situation and prevent riot and bloodshed. As noted above, the Legislature met in special session and passed measures to defray the expenses of State troops and guards. The Senate, on May 15, rejected by a vote of 26 to 4 a resolution calling for the resignation of Governor Ammons for incompetency in dealing with the strike. As it was evident that the local authorities could not control the situation, President Wilson on April 28 ordered Federal troops to Colorado to prevent fighting between the State militia and the striking

coal men, which troops remained in the State throughout the year.

In the primaries held on September 8, Senator Thomas, Democrat, was renominated for the United States Senate, and Thomas M. Patterson for Governor. The Republicans nominated Samuel D. Nicholson for Governor, and George A. Carleson for the Senate. Progressive nominations were Ben Griffith for Senator and E. P. Costigan for Governor. The Democrats in their State convention condemned violence, whether by corporations or labor organizations; favored local option in the prohibition of the liquor traffic, and the rigid enforcement of all laws and ordinances for its regulation. The Republican platform contained the plank: "We do not oppose any union of either capital or labor when organized to accomplish lawful objects by lawful means, but beyond this they must not go." The platform also demanded the adoption of an amendment to the Federal Constitution, insuring votes for women; liberal appropriations for good roads; the preservation of the rights of the States to the waters of the streams that are within their borders; invited the immigration to the State of industrious, honest, and healthy residents of Europe; demanded that the vicious and ignorant temporary sojourners be discouraged; and that those who refused to become American citizens be denied employment by individuals and corporations doing business in the State.

In the election on November 3, Senator Thomas was reelected, but the Democratic State administration overturned. George A. Carleson, Republican, was elected Governor, largely as a result of promises made by him to deal firmly with the strike situation. The State voted by a small majority for constitutional prohibition.

STATE OFFICERS, 1915. Governor, George A. Carleson; Lieut.-Governor, Moses E. Lewis; Secretary of State, John E. Ramer; Treasurer, Allison Stocker; Auditor, Harry E. Mulnix; Adjutant-General, ———; Attorney-General, J. Fred Farrar; Superintendent of Public Instruction, Mary C. C. Bradford—all Republicans except Farrar and Bradford, Democrats.

SUPREME COURT: Chief Justice, George W. Musser, Dem.; Justices, S. H. White, Dem.; W. A. Hill, Dem.; M. S. Bailey, Dem.; William H. Gabbert, Rep.; Tully Scott, Dem.; James E. Garrigues, Rep.; Clerk, James R. Killian, Dem.

STATE LEGISLATURE, 1915.

COLORADO, UNIVERSITY OF. A State institution of higher learning, founded at Boulder, in 1876. The students enrolled in the several departments of the university in the autumn of 1914 were 1280, and the faculty numbered 200. The most notable change in the faculty during the year was the resignation of James H. Baker as president, and the appointment of Livingston Farrand, M.A., LL.D., as his successor. The Denison Memorial building, valued at \$22,000, was donated to the university for medical research. The present yearly income is \$300,000. The library contains 80,000 volumes.

COLQUHOUN, ARCHIBALD ROSS. An English traveler and author, died in December, 1914. He was born on board a ship off the Cape of Good Hope in March, 1848, and was educated in Scotland and on the Continent. He held various government appointments in India, Burma, and Siam; in 1881-82 helped to locate the best route for a railroad between China and Burma; served as correspondent of the *London Times* during the Franco-Chinese War (1883-84); and in 1885-89 was deputy commissioner of Upper Burma. Shortly after he had been transferred to Baluchistan, criticism of superiors brought his career as an official to a sudden halt. Instead of retiring, he accompanied Cecil Rhodes's pioneer force to Mashonland, of which he was administrator in 1890-92. He visited Central America in 1895 to examine the Panama and Nicaragua canal routes, and wrote *The Key to the Pacific* (1895). His best work, *China in Transformation* (1898), is the result of a visit to China in connection with railroad construction plans. He continued to travel throughout the rest of his life, visiting Siberia, China, Japan, the Philippines, South Africa, the United States, and Panama again in 1913. His publications include: *Across Chryse* (2 vols., 1883); *The Opening of China* (1884); *Amongst the Shans* (1885); *English Policy in the Far East* (1885); *The "Overland" to China* (1900); *Russia Against India* (1900); *The Renaissance of South Africa* (1900); *The Mastery of the Pacific* (1902); *Greater America* (1904); *The Afrikander Land* (1906); *The Whirlpool of Europe: Austria-Hungary and the Hapsburgs*, with Mrs. Colquhoun (1907); *From Dan to Beersheba: Reminiscences of Public Service* (1908); *1912?: Germany and Sea Power* (1909); *China in Reformation* (1912).

COLUMBIA UNIVERSITY. An institution of higher learning, founded in New York City in 1754. The total number of students enrolled in all departments in the autumn of 1914 was 14,098, and the faculty numbered 2907. During the year 1914 the Faculty of Fine Arts was abolished. Several noteworthy benefactions were received during the year; among these was an anonymous gift of \$250,000 for the endowment of a new Faculty of Fine Arts; \$200,000 from Mrs. William Bayard Cutting for the establishing of a traveling scholarship fund; \$175,000 from the estate of Joseph Pulitzer for the School of Journalism; and \$100,000 from the estate of Francis Fernald. The amount of productive funds is \$30,771,868. The library contains 550,000 volumes exclusive of unbound pamphlets and 75,000 German dissertations. The president is Nicholas Murray Butler, LL.D.

CONCRETE. The extensive use of concrete, which increased in 1914, naturally gave rise to continued discussion and critical examination of cases where failures were reported or where concrete structures had been submitted to unusual fire conditions. Safety under load and durability under ordinary conditions had long been established for concrete, and its selection as a structural material had reached the point where it was governed by questions of economic adaptability. The fire in the Edison Works at West Orange, N. J., demonstrated the advantages of such construction presenting, as it did, the severe action of the intense heat evolved by the highly combustible contents of the buildings. The concrete structures, compared with the adjoining brick and steel buildings, demonstrated their superiority, and the examination made at the end of the year showed that a relatively small amount of repair would be needed for the concrete structures themselves, though, of course, their contents were utterly destroyed. See FIRE PROTECTION.

A notable series of tests of reinforced concrete dealing with the bond between concrete and steel, and with the theoretical structural consideration in the design of flat-slab floors, with various specimens for the standardization of tests, were in progress during the year. The Bureau of Standards at Washington continued its tests for the Government, carrying on important investigations in concrete road building, and made active progress during the year, while the usual number of concrete buildings were erected. The most notable concrete construction in progress was the important group of buildings for the Massachusetts Institute of Technology at Cambridge, Mass., which, if placed in line end to end would extend over 2500 feet. Various dry docks, piers, subways, aqueducts, bridges, viaducts, and other engineering structures were built during the year, and an important development was the use of reinforced concrete for stadiums for athletic contests. The Yale Bowl and the Princeton and Michigan stadiums were completed, while similar structures for Lehigh University and the College of the City of New York were in progress. See CEMENT.

CONDENSED MILK. See DAIRYING.

CONGO, BELGIAN. A Belgian colony in central Africa, formerly the Congo Free State under the sovereignty of the king of the Belgians, annexed to Belgium by treaty of Nov. 28, 1907, which was approved by the Belgian Parliament in August, 1908, and by the king the 18th of the following October. Capital, Boma.

AREA AND POPULATION. The statistics cited in this article are derived from the report of the Belgian colonial minister. In the table below are given the administrative divisions, the area in square kilometers, the white population Jan. 1, 1912, and the chief town of each division:

Div.	Sq. km.	Pop.	Capital
Lower Congo	40,110	1,062	Boma
Middle Congo	54,990	510	Léopoldville
Kwango	141,710	215	Bandundu
Lac Léopold II.	127,950	82	Inongo
Equateur	248,810	226	Ocoquilhatville
Bangala	128,910	178	Lisala
Ubangi	60,270	56	Libenge
Uele	219,790	278	Niangara
Aruwimi	66,190	111	Basoko
Stanleyville	456,430	540	Stanleyville
Kasai	365,230	467	Lusambo
Katanga	460,110	1,760	Kongolo
Total	2,365,000	5,465	Boma

Katanga is a vice-government-general. There are no official estimates of the native population; unofficial estimates vary from nine to twenty millions. The natives, principally of Bantu origin, practice gross fetichism.

PRODUCTION AND COMMERCE. The chief products are shown in the list of exports, rubber leading in importance. In the table below are shown imports and exports, total general trade, values in thousands of francs:

	1908	1909	1910	1911	1912
Imports	32,271	28,482	43,979	58,885	61,864
Exports	56,867	78,014	95,599	78,955	88,465

Imports in the 1912 trade, special and general, were as follows: Arms, ammunition, etc., 921,155 francs special and 1,148,178 francs general; steamers and ships, 3,503,892 and 3,993,120; machinery, 5,659,155 and 6,018,653; iron, steel, copper, 7,497,241 and 7,674,657; wines, spirits, 2,902,768 and 3,608,987; provisions, 8,101,570 and 9,582,697; apparel, 3,403,723 and 4,144,153. Exports of the principal products in the special trade are shown in the table below for comparative years, 1901-05 yearly average for the period, in thousands of francs:

	1901-5	1910	1911	1912
Rubber	44,056	51,016	84,427	84,519
White copal	739	3,848	1,814	6,885
Ivory	4,284	6,056	5,688	5,552
Copper	1,884	4,112
Gold	140	2,515	8,119	8,882
Palm nuts	1,489	2,657	2,879	2,771
Palm oil	986	1,798	1,782	1,258
Cacao	150	1,071	896	1,115

Imports in 1912 to the value of 35,785,348 francs came, from Belgium, and exports valued at 53,883,269 francs went to Belgium; United Kingdom, 5,670,133 francs imports and 557,920 francs exports; Germany, 4,078,710 imports; France, 1,143,738 imports; Netherlands, 1,113,487 imports and 1,172,345 exports, etc. There were entered at the ports in the 1912 trade, 705 vessels of 1,044,864 tons.

There were in the country Jan. 1, 1912, 1235 kilometers of railways in operation. Telephone lines, 1843 km., with 2704 km. of wires, and 19 telegraph stations. The telephone systems had 3181 kilometers of wires. Post offices, 50.

FINANCE AND GOVERNMENT. Revenue and expenditure for comparative years are given below, 1913 and 1914 being budget estimates, amounts in thousands of francs:

	1910	1911	1912	1914
Revenue	33,517	40,870	40,418	30,451
Expend.	40,371	59,658	50,938	†68,076

* Including 12,222,448 francs extraordinary. † Including 11,139,578 francs extraordinary.

Including the loans of April 15, and Dec. 26, 1912, the total public debt stood at 278,747,200 francs. The colony is administered by a governor-general, with a commissioner at the head of each district.

The Cape to Cairo Railway during 1914 had reached the heart of the Belgian Congo, where were located valuable copper deposits, which it was thought would prove of substantial commercial value.

CONGO, FRENCH. The former name of a French dependency. The name was changed in 1910 to French Equatorial Africa (q.v.).

CONGO FREE STATE. See CONGO, BELGIAN.

CONGREGATIONALISM. According to the Congregational Year Book for 1914, the total membership of this denomination in 1913 was 750,193; there being 6096 churches, 6066 ministers, and in the Sunday schools 70,460 pupils. There were 3012 young people's organizations with 123,912 members. The total contributions to all branches of the work of the denomination in 1913 amounted to \$2,378,702, and the total expenditures amounted to \$10,174,335.

The national societies include the Congregational Educational Society, the American Congregational Association, the American Board of Commissioners for Foreign Missions, the Congregational Home Missionary Society, the American Missionary Society, the Congregational Church Building Society, the Congregational Board of Ministerial Relief, the Congregational Sunday School and Publishing Society, the Woman's Home Missionary Federation, and the Woman's Board of Missions. Foreign missions are under the control of the American Board of Commissioners of Foreign Missions, which expended in 1913, \$1,103,163. There were in 1913, 615 American missionaries connected with 113 stations in practically all parts of the world. Home missions are carried on by the Congregational Home Missionary Society, in 26 States and Territories, the total receipts for home missions in 1913 amounting to \$274,803. In 1913 there were 1707 missionaries under commission for a whole or a part of the year. The theological seminaries are: Andover Theological Seminary at Cambridge, Mass., and Atlanta, Bangor, Hartford, Chicago, Oberlin, Talladega, Pacific, and Gale. The social work of the Church is in the hands of the Social Service Commission of the Congregational Church, which is a development from the work of the Department of Labor and Social Service of the Congregational Brotherhood of America. The general administration of the Church is in the hands of the National Council. The officers of the council in 1913 were: Rev. Charles Reynolds Brown, D.D., moderator; Rev. Hubert C. Herring, D.D., secretary; and Rev. Joel S. Ives, treasurer.

CONGREGATIONAL METHODIST CHURCH. There were in this denomination in 1913, 15,529 communicants, 333 churches, and 337 ministers. The denomination is strongest in the Southern States. It maintains a publishing house at Ellisville, Miss. The Atlanta Bible School is the only educational institute under its auspices. The official organ is *The Messenger*, published in that city. See also RELIGIOUS DENOMINATIONS AND MOVEMENTS.

CONGRESS OF THE UNITED STATES. See UNITED STATES.

CONNECTICUT. POPULATION. The estimated population of the State on July 1, 1914, was 1,202,688. In 1910 the population was 1,114,756.

AGRICULTURE. The area, production, and value of the principal crops in 1913-14 are shown in the following table. The figures are from the United States Department of Agriculture, and those of 1914 are estimates only.

		Acreage	Prod. bu.	Value
Corn	1914	61,000	786,000	\$2,497,000
	1913	61,000	608,000
Oats	1914	11,000	319,000	175,000
	1913	11,000	308,000	169,000
Rye	1914	7,000	183,000	180,000
	1913	7,000	185,000	124,000
Potatoes	1914	24,000	3,860,000	2,184,000
	1913	24,000	2,208,000	1,921,000
Hay	1914	875,000	a 469,000	9,146,000
	1913	879,000	432,000	8,688,000
Tobacco	1914	20,200 b	85,754,000	6,614,000
	1913	18,400	28,520,000	5,989,000

a Tons. b Pounds.

MINERAL PRODUCTION. The mineral production of the State in 1913 was valued at \$3,795,297, a record figure. The products include limestone, feldspar used in the manufacture of pottery, granite, trap rock, red sandstone, marble, brick, mineral waters, quartz, and precious stones.

CHARITIES AND CORRECTIONS. The charitable and correctional institutions of the State include Fitch's Home for the Soldiers' and Sailors' Hospital, at Noroton Heights; Connecticut Hospital for the Insane, at Middletown; Norwich State Hospital for the Insane; Connecticut State Prison, at Wethersfield; Connecticut School for Boys, at Meriden; Connecticut Industrial School for Girls, at Middletown; Connecticut Colony for Epileptics, at Mansfield; and the Connecticut School for Imbeciles, at Lakeville.

EDUCATION. The total school population of the State in 1913 was 255,692. There were enrolled in the public schools 197,852 pupils, and the average daily attendance was 155,235. There were 5130 female teachers and 361 male teachers, with an average salary of \$125 monthly for male teachers, \$57.87 for female teachers. The Legislature of 1913 provided for the codification of the school laws and for vocational guidance in schools. Provision was also made for the organization in each town of a model school for the observation and instruction of a training class for teachers.

FINANCE. The funded debt of the State on Sept. 30, 1912, consisted of one bond of an old issue on which the interest had ceased, and two series of bonds bearing interest; one amounting to \$3,064,000, for public buildings and highways, and the other, \$4,000,000, for miscellaneous purposes. The total receipts for the fiscal year 1913 were \$7,192,045. The expenditures, including bonds and temporary loans, amounted to \$9,062,857. The expenditures in excess of receipts amounted to \$1,870,812. The net debt at the end of the fiscal year 1913 was \$6,748,688. The per capita debt in 1912 was \$6.12.

TRANSPORTATION. The total mileage of single track railroad in the State in 1914 was 992. There were in addition 328 miles of second track, 47 miles of third track, and 47 miles of fourth track. The longest mileage was that of the New York, New Haven, and Hartford, 1269; the Central New England Railway, 88; and the Central

Vermont, 80. During the year the New York, New Haven, and Hartford double-tracked its line between Berkshire Junction and New Milford, and eliminated several grade crossings, and electrified portions of its track, especially freight lines and sidings.

POLITICS AND GOVERNMENT. The Legislature did not meet in 1914, as the sessions are biennial and the last was held in 1913. The only important political events were connected with the State elections and the election of United States Senator. Governor Baldwin early in the year announced his candidacy for the United States Senate to succeed Senator Brandegee, who was a candidate for reelection. The Republicans in their State convention endorsed their allegiance to the Republican policy of protection. Marcus H. Holcomb was nominated for Governor, and Senator Brandegee was renominated for the Senate. The Democratic platform endorsed the Democratic administration of national affairs under President Wilson and declared for a direct primary law, nominations by petition, and the initiative and referendum. The party also pledged itself to support the submission of a constitutional amendment providing for woman suffrage. Lyman T. Tingier was nominated for Governor and Simeon E. Baldwin for the Senate. The Progressive party endorsed the national platform of the party adopted in Chicago on Aug. 7, 1912; advocated the establishment of presidential primaries, the extension of suffrage to women, and the limit of election expenses in proportion to the size of the constituency. Herbert Knox Smith was nominated for the United States Senate and W. C. Fisher for Governor. In the election on November 3, the Republicans carried the State and elected Judge Marcus Holcomb for Governor. The vote was as follows: Holcomb, Republican, 91,241; Tingier, Democrat, 73,888; Fisher, Progressive, 8030. As a result of the election the State Senate was changed from Democratic to Republican. Five Democratic Congressmen were defeated. Senator Brandegee was reelected, receiving 89,983 votes, compared with 76,081 votes for Governor Baldwin.

STATE OFFICERS, 1915. Governor, Marcus H. Holcomb; Lieutenant-Governor, Clifford B. Wilson; Secretary of State, Charles D. Burnes; Treasurer, Frederick S. Chamberlain; Attorney-General, George E. Hinman; Commissioner of Insurance, Burton Mansfield—all Republicans except Mansfield, Democrat.

SUPREME COURT: Chief Justice, Samuel O. Prentice, Rep.; Associate Justices, George W. Wheeler, Dem.; John M. Thayer, Dem.; Alberto T. Roraback, Rep.; John K. Beach, Dem.; Clerk, George A. Conant, Rep.

STATE LEGISLATURE, 1915.

CONTRABAND OF WAR. The peculiar position of the United States, as the one great nation not involved or likely to be involved in the present European war, renders the question of contraband one of great importance. The failure of many governments, including our own, to ratify the Declaration of London of 1909 has left the subject of contraband very much where it has always been (consult CONTRABAND in second edition of the NEW INTERNATIONAL ENCYCLOPEDIA), the general conditions being briefly as follows:

Goods in transit to the open ports of a belligerent country are placed in three categories:

1. *Free.* All goods which cannot be used for war purposes.

2. *Contraband.* Goods which are used for war purposes.

3. *Occasional Contraband.* Goods which may be contraband or not, according to the use to which they are put.

It is not improper for a citizen of a neutral country to deal in contraband goods or transport them; nor does he compromise his government by so doing; nor are the officials bound to interfere to prevent contraband trade. But if contraband goods are seized by a belligerent when bound to the territory of an enemy, the owner must submit to their condemnation. All other goods on board belonging to such owner are also subject to forfeiture; in addition, the vessel if he owns it, or any share that he may own may be declared forfeited by the prize court. The vessel is not ordinarily subject to condemnation unless some fraud is proved, or the voyage was chiefly undertaken for the purpose of carrying the contraband. The rule of the Declaration of London is that all neutral vessels are subject to condemnation if contraband goods constitute more than half the cargo, measured either by value, weight, volume, or freight.

Any neutral vessel may be seized by the warship of a belligerent power upon reasonable proof that she is carrying contraband of war. If she is innocent, the captors are liable for damages; if she carries any contraband, she must pay the costs of the prize court procedure even if released.

The doctrine of *continuous voyage* has been applied to contraband goods sent through neutral countries and is a source of much trouble, dispute, litigation, and diplomatic wrangling. It means that contraband goods sent to a belligerent destination via a neutral port or country are liable to seizure in any part of the transit outside of neutral territory if the belligerent destination can be proved. The Declaration of London provides that conditional contraband is not subject to seizure except when bound for an enemy's port or to his armed forces unless the enemy has no seaboard; and the papers of a vessel carrying conditional contraband are conclusive proof of the port of discharge and of the voyage unless fraud is shown.

Notwithstanding the fact that the Declaration of London was not ratified by Great Britain, her government has acquiesced in most of its provisions and they are likely to be carried out in the present war unless the warships of Germany (whose attitude is not yet definitely known) should succeed in breaking through the British

fleet in such numbers as to render their action important.

Among the debatable features of contraband of war are the divisions of goods into the various categories. Each belligerent usually makes out and publishes his own lists of what he regards as free goods, occasional contraband, and contraband. Neutrals frequently protest and sometimes force or persuade the belligerent to give way in certain particulars. In order to reduce the causes for friction the Declaration of London promulgated lists of articles which may be considered (1) contraband, (2) occasional contraband, (3) never contraband.

Early in October the British government published its lists of absolute contraband and occasional contraband. These lists are given below. The paragraphs are identical with those of the Declaration of London except as regards: first, those marked (a) which the Declaration includes under conditional contraband; second, those marked (b) which it includes under free goods; and third, those marked (c) which are not specifically given in the Declaration.

BRITISH OFFICIAL LISTS

(1) ABSOLUTE CONTRABAND:—

Arms of all kinds, including arms for sporting purposes and their distinctive component parts.

Projectiles, charges, and cartridges of all kinds and their distinctive component parts.

Powder and explosives specially prepared for use in war.

(c) Sulphuric Acid.

Gun mountings, limber boxes, limbers, military wagons, field forges, and their distinctive component parts.

(c) Range finders and their distinctive component parts.

Clothing and equipment of a distinctively military character.

Saddle, draught, and pack animals suitable for use in war.

All kinds of harness of a distinctively military character.

Articles of camp equipment and their distinctive component parts.

Armor plates.

(b) Hematite iron ore and hematite pig iron.

(b) Iron pyrites.

(b) Nickel ore and nickel.

(b) Ferro-chrome and chrome ore.

(b) Copper, unwrought.

(b) Lead, pig, sheet, or pipe.

(b) Aluminum.

(b) Ferro-silica.

(a) Barbed wire and implements for fixing and cutting same.

Warships, including boats and their distinctive component parts of such a nature that they can be used on a vessel of war.

(a) Aeroplanes, air ships, balloons, and air craft of all kinds and their component parts, together with accessories and articles recognizable as intended for use in connection with balloons and air craft.

(c) Motor vehicles of all kinds and their component parts.

(c) Motor tires, rubber.

(c) Mineral oils and motor spirits except lubricating oils.

Implements and apparatus designed exclusively for the manufacture of munitions of war or for the manufacture or repair of arms or war materials for use on land and sea.

(2) OCCASIONAL CONTRABAND:—

Foodstuffs.

Forage and feeding stuffs for animals.

Clothing, fabrics for clothing, and boots and shoes suitable for use in war.

Gold and silver in coin or bullion, paper money.

Vehicles of all kinds, other than motor vehicles, suitable for use in war, and their component parts.

Vehicles, craft and boats of all kinds; floating docks, parts of docks, and their component parts.

Railway materials, both fixed and rolling stock, and materials for telegraphs, wireless telegraphs, and telephones.

Fuel other than mineral oil; lubricants.

Powder and explosives not specially prepared for use in war.

(c) Sulphur.

(c) Glycerine.

Horseshoes.

Harness and saddlery.

(b) Hides of all kinds, dry or wet; pigskins, raw or dressed; leather undressed or dressed, suitable for saddlery, harness, or military boots.

Field glasses, telescopes, chronometers, and all kinds of nautical instruments.

To avoid the delays and annoyances of protracted search, the United States government has suggested to the British that a vessel, which cares to take the trouble should be permitted to get a certificate from the United States authorities guaranteeing her cargo which is placed under seal. This procedure is of a doubtful desirability for many reasons, one or two of which are quite obvious, but there is a prospect that some such arrangements will be made. See WAR OF THE NATIONS.

COOLIDGE X-RAY TUBE. See RADIO-THERAPY AND ROENTGENOLOGY.

COPPER. The mine production of copper in 1913 was 1,235,569,727 pounds, and the smelter production was 1,224,484,098 pounds. The mine production in 1912 was 1,249,094,891 pounds, and the smelter production was 1,243,268,720 pounds. It will be noted from these figures that both the mine and the smelter production showed a slight decrease from that of 1912. The decrease in smelter production was due to abnormal conditions in certain districts. These conditions affected especially the output of the Lake Superior district, where a strike of miners was in progress for over four months of the year. The decrease in Alaska was due to the partial destruction of the plant of the largest producer of that district, and the decrease in Montana resulted in part from unusual conditions. The refinery production of copper in 1913 was the largest in the history of the industry. The sale price in 1913 averaged about one cent a pound less than in 1912.

Perhaps the most notable feature of the industry during the year was the improvement in metallurgy. In many places successful efforts were made to increase the percentage of recovery from ores. This resulted in partial or complete rebuilding of several smelting plants and in important changes and additions to concentrating mills.

Both domestic consumption and export of copper showed an increase in 1913 over 1912, and the stocks of refined copper were small at the end of the year. It was apparent, however, that the producing capacity of the world had increased faster than the consuming capacity. Thus if all the mines made their greatest possible output a surplus of copper would result. It was almost inevitable, however, that the producing capacity of some of the districts would be restricted on account of unusual conditions temporarily prevailing in these districts. Since 1911 the Mexican output was thus curtailed by unsettled political conditions, and the Lake Superior output as noted above was greatly reduced in 1913 by labor conditions.

Twenty-four States and Territories contributed to the copper production of 1913. Three leading States, Arizona, Montana, and Michigan, produced 69 per cent of the total output. The same States produced 72 per cent in 1912. The eight leading States, including Utah, Nevada,

Alaska, California, and New Mexico, produced over 96.78 per cent in 1913. Montana continued to rank first in 1913, with nearly one-third of the entire output of the country. Michigan ranked second, with more than 28 per cent, and Arizona third, with over one-fifth the total output. (For details of production in the different States see the paragraphs on minerals under those States.) The accompanying table shows the production of copper in pounds in the United States in 1912-13.

State	1912	1913
Alaska	81,926,209	28,423,070
Arizona	859,822,096	404,278,809
California	81,516,471	82,492,285
Colorado	7,968,520	9,052,104
Idaho	7,182,185	8,711,490
Michigan	281,112,328	155,715,286
Montana	908,770,826	285,719,918
New Mexico	29,170,400	50,196,881
Nevada	88,413,900	85,209,586
Oregon	811,860	77,812
South Dakota	28,657	4,549
Utah	182,150,052	148,057,450
Washington	1,069,938	732,742
Wyoming	25,080	862,285
Eastern States and unapportioned	19,810,298	20,449,951
Total	1,243,268,720	1,224,484,098

The quantity of copper in unmanufactured form imported into the United States in 1913 was 409,560,954 pounds, compared with 410,240,295 pounds in 1912. The exports of metallic copper from the United States in 1913 amounted to 926,441,142 pounds.

WORLD PRODUCTION. The world production of copper in 1913 was 2,198,732,130 pounds, compared with 2,259,101,580 pounds in 1912. In 1913 the smelter output of the United States was 55.8 per cent of the world's production, as compared with 55 per cent in 1912. The following table shows the world production by countries. The figures are those compiled by Henry R. Merton & Co. (Ltd.), reduced to pounds, except that the official figures for the production of United States and Canada are inserted.

WORLD'S PRODUCTION (SMELTER OUTPUT) OF COPPER IN 1912 AND 1913, IN POUNDS
(Copper extracted from ore or contained in the ore produced)

Country	1912	1913
Germany	56,437,760	55,776,880
England	661,880	661,880
Italy	5,070,580	8,527,860
Norway	24,471,060	19,400,480
Austria	8,597,940	8,877,480
Russia	78,854,100	74,785,940
Sweden	3,806,900	2,204,600
Spain and Portugal	182,055,540	120,591,620
Turkey	1,102,800	1,102,800
Hungary	120,460	661,880
Servia	16,814,040	14,109,440
Total Europe	822,092,060	801,148,860
Canada	77,775,600	76,975,832
Mexico	162,479,020	116,402,880
Newfoundland	1,102,800	
United States	1,248,268,720	1,224,484,098
Total North America	1,484,625,640	1,417,862,810
Argentina	661,880	220,460
Bolivia	8,157,020	8,157,020
Chile	83,554,340	88,184,000
Peru	58,421,900	58,658,220
Venezuela	8,086,400	2,865,980
Cuba	9,700,240	7,495,640
Total Central America and South America	168,581,280	168,581,820

Country	1912	1913
Cape Colony	8,597,940	7,275,180
Namaqualand	5,611,500	5,511,500
Other Africa	22,486,920	87,698,660
Total Africa	86,596,860	50,485,840
Japan	146,826,860	161,876,720
Australia	105,879,880	104,277,580
Grand total	2,259,101,580	2,198,732,130

PRODUCTION IN 1914. The copper production in 1914, according to the estimates of the United States Geological Survey, showed a marked decrease from that of 1913. At an average price of about 13.5 cents a pound, the output in 1914 was valued at \$152,400,000, compared with \$189,795,000 in 1913. The large decrease in production was due to curtailment of production during the later part of the year on account of the reduction in tonnage exported to Europe. The smelter production of copper in 1914 was estimated at 1,129,000,000 pounds; the output of refined copper from primary sources was 1,493,000,000 pounds, compared with 1,615,067,000 pounds in 1913. The export of copper in all forms for the first eleven months in 1914 amounted to 780,048,777 pounds, compared with an export for the twelve months of 1913 of 926,441,142 pounds. The average price of copper for 1913 showed a decrease from that of the preceding year, being about 13.5 cents a pound, compared with 15.5 cents in 1913. After the outbreak of the European war copper sold considerably below the yearly average, but toward the close of the year the price showed notable improvement.

WORLD'S PRODUCTION OF COPPER (a)
From *Engineering and Mining Journal*. Preliminary estimates for 1914
(In Metric Tons of 2204.6 lbs. Avoirdupois)

Country	1913	1914
United States	555,990	515,164
Mexico	58,328	85,486
Canada	34,880	38,248
Cuba	3,381	6,628
Australasia	(b) 47,825	(a) 38,782
Peru	25,487	22,876
Chile	89,484	88,270
Bolivia	(b) 8,658	(a) 8,500
Japan	(b) 78,152	(d) 68,058
Russia	(c) 84,316	(a) 82,000
Germany	(b) 25,308	(a) 28,000
Africa	(b) 22,870	25,700
Spain and Portugal	(b) 54,696	(f) 47,500
Other countries	(b) 27,158	28,000
Totals	1,005,978	918,162

(a) The statistics in this table are the compilations of the *Engineering and Mining Journal*, N. Y., except where specially noted to the contrary. (b) As reported by Henry R. Merton & Co. (c) As officially reported. (d) Privately communicated to the *Engineering and Mining Journal*, N. Y., from Japan. (e) Exports as reported by Henry R. Merton & Co. (f) Estimated. (g) Communicated through London.

WORLD'S CONSUMPTION OF COPPER
From *Engineering and Mining Journal*
(Metric Tons of 2204.6 lbs. Avoirdupois)

(From statistical report of the Metallgesellschaft, Frankfurt am Main)

Europe	1912	1913
Germany	281,700	259,300
Great Britain	144,700	140,300
France	98,500	103,600
Austria-Hungary	48,200	39,200
Russia	40,000	40,200
Italy	34,200	31,200
Belgium	15,000	15,000
Netherlands	1,000	1,000
Other European countries	10,200	18,300
Total consumption in Europe	628,500	643,100

America	1912	1913
United States	371,800	348,100
Others in America	8,000	8,000
Total consumption in America..	374,800	351,100
Asia, Australia, Africa		
Production, Japan and Australia	111,900	119,000
Imports from Europe	1,400	1,000
Imports from America	500	80
Total	113,800	120,100
Exports to Europe and America..	73,400	69,800
Consumption in Asia, Australia and Africa	40,400	50,800
World's Consumption	1,088,700	1,044,500
World's production	1,018,600	1,005,900
s Estimated.		

In the latter part of 1914 there was a brisk demand for copper metal by agents of various European countries, and large shipments were made with Italian and Scandinavian ports as destination. Great Britain, however, was very active in seizing and detaining such cargoes whenever they were considered by her naval officers as ultimately intended for Germany or Austria; and at the close of the year it was estimated that about 45,000,000 pounds were so detained. On December 24, the American note, one portion of which dealt particularly with such seizures, was transmitted to Great Britain, and it was expected that the matter would be adjusted in a manner satisfactory to both sides. See CONTRABAND OF WAR; METALLURGY; and WAR OF THE NATIONS.

COPYRIGHT. The copyright registrations for the fiscal year (July 1, 1913 to June 30, 1914) numbered 123,154, and included chiefly registrations of books, periodicals, dramatic and musical compositions, works of art and reproductions thereof, photographs, and prints. Of books printed in the United States, 28,591 were registered, books here being understood to include pamphlets, leaflets, and contributions to periodicals. Of books printed abroad in a foreign language there were 2860 registered, and of English books for *ad interim* copyright, 440.

An important amendment (March 28, 1914) to the copyright law demands only one copy, in lieu of two, for deposit to secure registration of a book published in a foreign country, by an author who is a citizen or subject of a foreign state or nation. A ten-cent stamp must now be affixed to copyright certificates in accordance with the war revenue tax (Dec. 19, 1914). A judicial decision concerning copyright books—and one of great importance to publishers—was rendered by the United States Supreme Court in December, 1913, too late for inclusion in the *YEAR BOOK* for 1913. The reference is to the case of *Macy v. Publishers' Association*. The Court decided that owners of copyrights have no legal right to maintain or to regulate prices of books. This decision would seem to have been based upon the application to books of the provisions of the Sherman act, which was designed to cover an entirely different class of articles, the sale of which proceeds under selling conditions very different from those which are proper to the book trade. The right to control, by regulation, conditions of bookselling can now be secured only through new legislation. The publishers, in protesting against this decision, gave weight to their argument by showing that of the world's book-

producing countries the United States stands alone in enjoining its publishers and booksellers from maintaining an organization of the book trade, and from making regulations for the sale of books.

Abroad, in February, 1914, the British Copyright Act of 1912 was confirmed, with a few modifications, by India, as it was in April, 1914, by New Zealand.

CORDIALS. See LIQUORS.

CORN. A general review of the world corn crop published by the United States Department of Agriculture points out that in round numbers 130,000,000 acres are planted to corn in the principal producing countries of North and South America, and that of this area 105,000,000 are in the United States, 13,000,000 in Mexico, 10,000,000 in Argentina, and nearly 1,000,000 acres in Uruguay, Chile, and Canada combined. Attention is called to the increase in corn consumption in the United States by the fact that although the area has been increased by about 25,000,000 acres since 1897, the exports, which reached the maximum of 189,000,000 bushels in that year, have steadily declined and amounted to only 45,000,000 bushels in 1913, offset to the extent of over 5,000,000 bushels by imports from Argentina. The importations from Argentina from July 1, 1913, to Feb. 13, 1914, as reported by Bradstreet's, amounted to 7,132,980 bushels, of which about 85 per cent went to the Atlantic seaboard, and the remainder to Gulf ports. The area in corn in Argentina increased from 3,000,000 acres in 1900, to 10,250,000 acres in 1914, and of the record crop of 296,000,000 bushels produced in 1912, 190,000,000 bushels were exported.

The principal corn-growing regions of the Eastern Hemisphere are in southern Europe, Asia, and northern and southern Africa. The corn belt of southern Europe produces annually from 600 to 700 million bushels on about 30,000,000 acres. The leading corn-producing section of Europe, comprising Austria-Hungary, Rumania, Servia, Bulgaria, and Southern Russia, plants annually more than 20,000,000 acres and has a normal yield of about 500,000,000 bushels. The acreage devoted to corn in Hungary and Bulgaria is second only to wheat, and in Rumania and Servia corn is the leading cereal. In Asia the crop is grown in Turkey, Southern Asiatic Russia, British India, French Indo-China, the Philippines, China, and Japan. Asiatic Turkey cultivates nearly 1,000,000 acres, British India over 6,000,000, the Philippines over 1,000,000, and Japan over 130,000 acres annually. In Africa, Egypt, the principal producing country, grows nearly 2,000,000 acres, and the yearly production in southern Africa now amounts to more than 30,000,000 bushels. Small areas are devoted to corn culture in Tunis, Algeria, Tripoli, and Morocco. Australia and New Zealand also produce corn on a small scale.

The world's corn production, according to data published by practically all important corn-producing countries, has ranged in recent years from $3\frac{1}{2}$ to 4 billion bushels, or about equal to the production of wheat. The estimates of production for different countries in 1914 indicated a normal crop. Probably as the result of the disturbed political conditions, data on corn production in some of the south European countries were not available. The estimated pro-

duction and acreage of some of the more important corn-growing countries were given as follows: Rumania 111,850,000 bushels and 5,121,500 acres, Italy 102,600,000 bushels and 3,705,000 acres, European Russia 72,307,000 bushels and 3,891,200 acres, Spain 28,740,000 bushels and 1,064,000 acres, and Japan 3,760,000 bushels and 141,037 acres. The average yields reported for the different countries ranged from 37½ bushels per acre in Switzerland, which has but a small acreage, to about 18½ bushels in European Russia. In Canada corn is grown more extensively for the silo than for grain production. In 1914 the Province of Ontario, which produces over 90 per cent of the country's crop, cultivated 290,817 acres for grain and 418,105 acres for silage, the latter area yielding over 4,750,000 tons, or over 11¼ tons per acre.

As reported by the Department of Agriculture, the United States in 1914 produced a total of 2,672,804,000 bushels on 103,435,000 acres, the average acre-yield being 25.8 bushels. In 1913 the production amounted to 2,446,988,000 bushels, the acreage to 105,820,000 acres, and the average yield was 23.1 bushels per acre. The value of the 1914 crop based on a bushel value of 63.7 cents, the average price received by farmers December 1, reached \$1,702,599,000, as compared with \$1,692,092,000, the value of the preceding crop based on a corresponding value of 69.1 cents per bushel. Dry weather interfered in some sections, and particularly in the corn surplus States, notably in Illinois, Missouri, and Indiana, where the crop was much reduced. However, rains coming late in the season effected an improvement in the development of the crop and its maturity. As reported by *American Agriculturist*, Iowa, the leading State, produced 377,733,000 bushels on 10,209,000 acres, and was followed by Illinois with a production of 298,816,000 bushels on 10,304,000 acres, Nebraska 177,528,000 bushels on 7,397,000 acres, Missouri 161,744,000 bushels on 7,352,000 acres, Indiana 157,128,000 bushels on 4,929,000 acres, Ohio 148,356,000 bushels on 3,804,000 acres, Texas 127,300,000 bushels on 6,700,000 acres, Kansas 115,704,000 bushels on 6,428,000 acres, and Kentucky 101,472,000 bushels on 3,624,000 acres. The highest average acre yields reported were 39 bushels for Ohio, 40 bushels for New York, and 44 bushels for Pennsylvania. The percentage of old corn in farmers' hands Nov. 1, 1914, was less than usual, being only 2¼ per cent of the preceding year's crop, or about 62,000,000 bushels, while on the corresponding date in 1913 it was more than twice that quantity.

CORNELL UNIVERSITY. An institution of higher learning, at Ithaca, N. Y., founded in 1865. The enrollment in all departments in the autumn of 1914 was 6496, divided as follows: College of Arts and Sciences, 1536; College of Agriculture, 1920; College of Architecture, 191; College of Civil Engineering, 623; College of Mechanical Engineering, 1110; College of Law, 344; College of Veterinary Science, 168; College of Medicine, 130; Graduate School, 150. The faculty numbered about 760. During the year 1913-14 three members of the faculty died; these were Prof. Lucien Augustus Wait, Sept. 6, 1913; Prof. John Robert Sitlington Sterrett, June 15, 1914; and Prof. Ralph Charles Henry Catterall, Aug. 3, 1914. Two professors retired under the age rule; these were John Henry Comstock of the department of entomology, and Charles De-

Garmo, head of the department of education. Prof. James Edwin Creighton was appointed dean of the Graduate School for a term of three years to succeed Prof. Ernest Merritt, retired, and Dr. Beverly Thomas Galloway, formerly Assistant Secretary of Agriculture of the United States, was appointed director of the College of Agriculture and of the agricultural experiment station. The Jacob H. Schiff lectureship in German Culture was occupied in 1913-14 by Prof. Ernst Elster of the University of Marburg, and Dr. Artur Weese, professor of the history of art in the University of Berne, Switzerland, was appointed lecturer on this foundation for 1914-15. He will lecture on German art. The Goldwin Smith lectureship for 1914-15 was filled by the appointment of Dr. Roscoe Pound, Carter professor of jurisprudence in the Law School of Harvard University, who will lecture on "Modern Justice" with special relation to the social and industrial questions of the present day. The chief financial event in the history of the university for the year 1913-14 was the endowment of the Medical College in New York City. Securities of the value of \$4,350,000 and producing an income of somewhat over \$200,000 were handed over to the trustees of the university by a donor whose name is withheld. The productive funds of the university amounted at the end of the year 1913-14 to \$13,973,542. The library contains about 440,000 volumes. The president is Jacob Gould Schurman.

CORPORATIONS. See TRUSTS, and TAXATION.

CORPORATION TAX. See TAXATION.

COSTA RICA. A Central American republic between Nicaragua and Panama. The capital is San José.

AREA, POPULATION, ETC. The area of the republic has been estimated at 48,410 square kilometers (18,691 square miles). The boundary dispute between Costa Rica and Panama was submitted, under a convention of March 17, 1910, to the arbitration of the Chief Justice of the United States. The decision of the Chief Justice, announced Sept. 12, 1914, was favorable to Costa Rica; so that, if the boundary described by the arbitration becomes established in fact, the area of Costa Rica will exceed the figure given above. (See PANAMA.) The population at the end of 1911 was estimated at 388,266; 1912, 399,424; 1913, 410,981. The recorded births and deaths in 1911 were 16,839 and 9483, respectively; in 1912, 17,125 and 9378; in 1913, 17,746 and 9382. The excess of recorded immigrants over recorded emigrants in 1912 was 1360; in 1913, 2328. The population of San José at the end of 1913 was stated at 33,900; Alajuela, 6260; Cartago, 7000; Heredia, 8000; Limón, 7000; Puntarenas, 4850. The white population dwells largely in these towns. In 1912, there were 402 public elementary schools, with 1191 teachers, an enrollment of 31,407 pupils, and an average attendance of 27,680. In 1914 the public schools were reported to number 414, of which 30 were for boys, 30 for girls, and 354 for both sexes. There are a few secondary schools.

PRODUCTION AND COMMERCE. The principal crops are bananas and coffee, but of considerable importance also are corn, sugar, beans, potatoes, rice, and cacao. There were about 11,171,000 coffee trees in Costa Rica in 1913; the area

under bananas was 95,400 acres. Cattle raising is important. Gold and silver are mined.

Total imports and exports in 1913 were reported at 18,677,653 and 22,196,921 colones, respectively, as compared with 21,675,928 and 21,427,966 in 1912, 19,079,917 and 19,191,808 in 1911, and 16,984,378 and 18,009,385 in 1910 (the value of the colon in United States money being 46.5 cents). The principal imports are cotton goods, structural iron and steel and railway material, coal, flour, and lard. Bananas and coffee make up the bulk of the exports. The number of bunches exported has been as follows: In 1909, 9,365,690; in 1910, 9,097,285; in 1911, 9,309,586; in 1912, 10,647,702; in 1913, 11,170,812. By far the greater part of the bananas go to the United States, to which in 1913 were sent from Costa Rica 8,354,722 bunches, while to the United Kingdom were sent 2,713,111 bunches. The coffee export during crop years ended September 30 is reported as follows, in metric tons: In 1909, 12,030; in 1910, 14,397; in 1911, 12,641; in 1912, 12,238; in 1913, 13,019. Of the 1913 export, 82 per cent was consigned to the United Kingdom, 8 per cent to Germany, 6 per cent to the United States, and 3 per cent to France. The value of the banana and coffee exports, respectively, were: 9,365,690 and 5,677,146 colones in 1909; in 1910, 9,097,285 and 5,916,181; in 1911, 9,309,586 and 6,109,542; in 1912, 10,647,702 and 7,623,561; in 1913, 11,170,812 and 7,752,750. The export of gold and silver bullion in 1911 amounted to 2,517,372 colones; in 1912, 1,625,117; in 1913, 1,827,553. Export of cabinet woods: in 1911, 193,732; in 1912, 265,483; in 1913, 304,003. The share per cent of the trade by countries is as follows:

	Imports		Exports	
	1912	1913	1912	1913
United States	50.46	51.44	49.90	50.77
Germany	17.24	15.44	5.55	4.89
United Kingdom	15.95	14.85	41.64	41.88
France	4.86	4.46	1.30	.98
Central America	3.82	4.03	.48	.38
Spanish America	1.48	3.50	.70	.58
Other	6.19	6.28	.43	.62

Most of the trade passes through the port of Limón. In 1912, the reported entrances at Limón were 538 vessels, of 1,129,606 tons; at Puntarenas, 87 vessels, of 178,904 tons.

COMMUNICATIONS. The total length of railway in operation in 1911 was 687 kilometers (431 miles). Some subsequent extensions have been made into the banana lands. Daily passenger trains each way are run between San José and Limón, on the Atlantic coast, and San José and Puntarenas, on the Pacific. Telegraphs in 1912: 134 offices, with 2447 km. of wire; a radiotelegraph station is in operation at Limón; post offices, 204.

FINANCE. The standard of value is gold. The monetary unit is the colon, par value 46.536 cents. Revenue and expenditure for three years and the estimates for 1915 are shown below:

	1910	1911	1912	1915
Revenue	11,471,967	9,707,269	9,950,672	9,662,000
Expend.	8,858,572	9,801,956	9,810,719	9,661,089

The budget for 1914 placed the revenue at 9,200,000 colones, and the expenditure at 9,013,635. Principal estimated receipts for 1915: customs, 5,600,000 colones; liquors, 2,438,000; Pacific Railway, 772,000; banana export duty,

233,000; posts and telegraphs, 355,000; stamps and sealed paper, 140,000. Principal estimated disbursements for 1915: finance, 3,130,112 colones; public instruction, 1,546,718; fomento, 1,477,747; war, 1,441,459; justice, 387,236. The foreign debt at the end of 1912 amounted to £1,617,200, and 35,000,000 francs.

GOVERNMENT. The executive authority is vested in a president who is elected by indirect vote for four years and is ineligible for the following term. The legislative power devolves upon a congress consisting of a single chamber of 43 deputies, also elected indirectly. The president for the term ending May 8, 1914, was Ricardo Jiménez. In the presidential election of December, 1913, no candidate won a majority in the electoral college. Under the constitution the task of selecting a chief executive devolved upon the congress. The candidates having the highest number of votes in the electoral college were Carlos Durán and Máximo Fernández, but these men withdrew from the contest and on May 1 the congress elected Alfredo González, who was inaugurated May 8, 1914.

HISTORY. Alfredo González, a lawyer and agriculturist from the Province of Heredia, who had been vice-president of Congress under President Jiménez, was elected President of the Republic and inaugurated on May 8. He announced that his policy would be to promote education, to foster agriculture, and to improve the financial situation of the country. He selected the following cabinet: Foreign affairs, Sr. Don Manuel C. Quesada; interior, Juan Rafael Arias; finance and commerce, Mariano G. Carazo; fomento and public works, Alberto Echandi; war, Federico A. Tinoco; education, Luis Felipe González. See also INTERNATIONAL ARBITRATION AND PEACE, *Bryan-Wilson Treaties*.

COST OF LIVING. See FOOD AND NUTRITION; and PRICES.

COTTON. The cotton crop of the United States for 1914 was the largest ever produced. From a planted area of 36,960,000 acres, about 1.3 per cent less than that of 1913, the United States Department of Agriculture on Dec. 10, 1914, estimated the production of 15,966,000 bales of 500 pounds each. With the linters estimated on the usual basis, the total crop, it was believed, would be 16,616,000 bales. The United States Bureau of the Census on Dec. 13, 1914, reported 13,977,189 running bales as already ginned. This report included 42,796 round bales, each of which is counted as half a bale, and 71,488 bales of Sea Island cotton. The Sea Island cotton was produced as follows: Florida, 30,586; Georgia, 37,385; South Carolina, 3517 bales. On Nov. 21, 1914, the International Institute of Agriculture at Rome estimated the cotton crops of the United States at 15,340,000 and of India at 4,178,000 bales. No estimates were available regarding the Egyptian crop, but it was reported as slightly below normal.

The crop of the United States for 1913, the estimated crop for 1914, and the amount reported ginned on Dec. 13, 1914, exclusive of linters, by States were:

States	Crop, 1913 500 lb. bales	Estimated crop, 1914 500 lb. bales	Reported ginned, Dec. 13, 1914 500 lb. bales
United States ..	14,156,486	15,966,000	13,977,189
Alabama	1,495,485	1,690,000	1,578,188

States	Crop, 1913 500 lb. bales	Estimated	Reported
		crop, 1914 500 lb. bales	Dec. 18, 1914 ginned, Running bales
Arkansas	1,072,846	1,040,000	894,277
Florida	58,695	75,000	80,868
Georgia	2,316,601	2,650,000	2,452,790
Louisiana	448,821	460,000	415,533
Mississippi	1,810,743	1,275,000	1,085,002
North Carolina	792,545	950,000	766,678
Oklahoma	840,387	1,250,000	1,068,898
South Carolina	1,377,814	1,500,000	1,328,395
Tennessee	379,471	365,000	319,848
Texas	8,944,970	4,560,000	3,875,144
All other States	128,108	151,000	116,583

Of the States listed as "all others," Missouri produced in 1913, 67,105 and Virginia 23,490 bales. For 1914 these States were estimated to produce 75,000 and 24,000 bales respectively. California, which includes the crop of Lower California, was estimated to produce 37,000 bales, and Arizona, New Mexico, Kansas, and Kentucky were expected to add 15,000 bales as their contribution to the crop. In spite of the huge crop of cotton, its value was estimated on Dec. 10, 1914, at only \$519,612,000, a very marked falling off from the record crop of 1913. The reduction in the value of the crop was largely due to the war in Europe lessening the demand for cotton. To obviate this condition, which is world wide, various measures have been undertaken by governments, financial agencies, etc. In the United States a fund of \$135,000,000 was contributed by banks of the country to help carry the crop until conditions again become normal. A bill for permissive bonded warehousing has passed both houses of Congress and is now (January 1) in conference committee. The Cotton Futures Act, by which standards, forms of contracts, deliveries, etc., are established, was passed by Congress and became a law Aug. 18, 1914.

The cotton crop of the United States for 1913, as finally reported by the Bureau of the Census, was 14,156,486 gross bales of 500 pounds each. In addition there were obtained 638,881 bales of linters and 6,305,000 tons of seed, of which 4,767,802 tons were crushed for oil. The aggregate value of the entire cotton crop for 1913 was \$1,043,760,000. The production of Sea Island cotton does not appear to keep pace with that of upland cotton; indeed it seems the crop for 1914 may not equal that of 1913. This is doubtless due to the increased production of long staple upland cottons of excellent quality. The West Indian production of cotton, most of which is of Sea Island type, does not appear to be increasing, and the situation in the autumn of 1914 was said to be extremely critical. An attempt was made in 1914 to restore the growing of Sea Island cotton in the Bahamas, but the effort was not highly successful. The experiment of growing Egyptian types of cotton in Arizona has been so successful that in 1914 about 9000 acres were planted to that crop. Two or three locally produced strains of Egyptian cotton have been developed that are said to be very promising in yield and in character of lint. In California, especially in the Imperial Valley, the growing of cotton is being rapidly extended, Durango, a long staple upland variety, being the kind most planted.

The world's production of commercial cotton in 1913, according to Bureau of the Census Bulletin 125, was 22,225,000 bales, an increase of about 1,250,000 bales over that of 1912. The

contributions of the leading countries to the mill supply for 1912 and 1913 are given in the following table:

Country	1912	1913
	500 lb. bales	500 lb. bales
Total	22,225,000	20,976,000
United States	13,545,000	18,118,000
India	3,801,000	3,828,000
Egypt	1,470,000	1,492,000
China	1,200,000	1,074,000
Russia	1,004,000	917,000
Brazil	420,000	815,000
Mexico	150,000	140,000
Peru	110,000	110,000
Persia	140,000	187,000
Turkey	180,000	116,000
All other countries	285,000	285,000

The world's consumption of cotton for the year ended Aug. 31, 1914, was 21,223,000 bales, of which the United States supplied 60.9; India, 17.1, and Egypt, 6.6 per cent. It is estimated there were 146,397,000 active spindles in 1914 working up this cotton crop, 32,107,000 of which were in the United States. These were divided as follows: Cotton-growing States 12,711,000, and other States 19,472,000. The cotton exports from the United States for the year ending Aug. 31, 1914, were 8,654,958 bales, and the imports were 280,290 bales, of which Egypt contributed 137,355; China, 21,926; Peru, 12,629; India, 8186; and Mexico, 99,318 bales. Re-exports amounting to 14,644 bales were made, leaving the net imports 265,646 bales.

The cotton crop of the United States for 1914 was the largest ever produced. From a planted area of 36,960,000 acres, about 1.3 per cent less than that of 1913, the United States Department of Agriculture on Dec. 10, 1914, estimated the production of 15,966,000 bales of 500 pounds each. With the linters estimated on the usual basis, the total crop, it was believed, would be 16,616,000 bales. The United States Bureau of the Census reported on Jan. 9, 1915, 14,447,623 running bales as ginned to January 1. This report included 44,816 round bales, each of which is counted as half a bale, and 76,886 bales of Sea Island cotton. The Sea Island cotton was produced as follows: Florida, 32,326; Georgia, 40,007; and South Carolina, 4553 bales. On Nov. 21, 1914, the International Institute of Agriculture at Rome estimated the cotton crops of the United States at 15,340,000, and of India at 4,178,000 bales. No estimates were available regarding the Egyptian crop, but it was reported as slightly below normal.

The crop of the United States for 1913, the estimated crop for 1914, and the amount reported ginned to Jan. 1, 1915, exclusive of linters, by States were:

States	Crop, 1913	Estimated	Reported
	500 lb. bales	crop, 1914 500 lb. bales	ginned Jan. 1, 1915 Running bales
United States	14,156,486	15,966,000	14,447,623
Alabama	1,495,485	1,690,000	1,689,198
Arkansas	1,072,846	1,040,000	914,115
Florida	58,695	75,000	85,726
Georgia	2,316,601	2,650,000	2,547,747
Louisiana	448,821	460,000	427,509
Mississippi	1,810,743	1,275,000	1,115,817
North Carolina	792,545	950,000	815,116
Oklahoma	840,387	1,250,000	1,096,196
South Carolina	1,377,814	1,500,000	1,390,825
Tennessee	379,471	365,000	330,811
Texas	8,944,970	4,560,000	3,959,299
All other States ..	128,108	151,000	125,754

The production of India was estimated at about 460,000 bales greater than in 1913. In Egypt the area planted was nearly two per cent greater, but on account of insect ravages no increase in the total crop was anticipated. Experiments in Egypt have shown that a considerable area in the Delta can be reclaimed for cotton culture, but Schanz claims the crop can not exceed 2,300,000 bales with the present water supply, even with an average production of 430 pounds of lint per acre. An attempt has been begun to secure the growing of better and more uniform cotton by the selling at low prices of cotton seed of known purity. The exports from Egypt for the year ending Aug. 31, 1914, were 970,263 bales of 750 pounds each. Through the International Federation of Master Cotton Spinners and Manufacturers, an attempt is being made to improve cotton culture in India. A model plantation is to be established and selected seed will be sold to planters. The report of the British Cotton Growing Association shows the production in new British fields in 1913 as follows: West Africa, 16,300 bales of 400 pounds each; East Africa, 34,500; Sudan, 20,000; West Indies, 7000; and all others 1000 bales, or a total of 78,800 bales. The quality of the West Indian cotton is said to be highly satisfactory. In Lagos a considerably larger crop was produced than in 1912. The results in the Gold Coast Colony are said to be disappointing. In Nigeria local demands have reduced the amount of cotton for export. The Uganda cotton is said to grade with the better qualities of Texas cotton. The results in Nyasaland have been distinctly disappointing both in production and quality. The association has withdrawn from Rhodesia, and unsatisfactory results are generally reported for the Union of South Africa. About 9600 bales of 500 pounds each were exported from German East Africa during 1913, and American upland varieties are said to be giving better results than Egyptian or local cottons. In Russia the area planted to cotton in 1914 was 1,979,000 acres, an increase of about five per cent over that of 1913, when 1,004,000 bales were produced. An attempt is being made through the Banco Agricola to foster the growing of cotton in Paraguay. An unexpected pest of cotton was reported in St. Kitts, where the Australian cockroach (*Periplaneta australasiae*) destroyed several plantings.

The United States Department of Agriculture and the various experiment stations in the cotton growing States are continuing their work in improving cotton culture by breeding, better use of fertilizers, methods of culture, etc. Much of the effort is being directed to securing earlier production and thus circumventing the cotton boll weevil. This pest, according to the survey of the Bureau of Entomology, made a very small advance in its northern and eastern spread in 1914. It has apparently just reached the State line between Mississippi and Tennessee on the north and the extreme southwestern border of Georgia on the east. All of Alabama seems to be infested west of a diagonal line from the northwestern to the southeastern corners of the State. In Texas and Oklahoma the advance for 1914 was very small. The Department's work with cotton in Arizona and California has been already referred to. Experiments in progress indicate the possibility of

developing a cotton industry in the southwest beyond the supposed limits of the boll weevil. Later thinning and single stalk culture as aids to combating the boll weevil are giving promising results. Congress directed the Secretary of Agriculture to make tests as to waste, tensile strength, and bleaching qualities of the various grades of cotton established by the government, and comparisons of western and Atlantic States upland cotton show but one or two per cent variation in waste in all the samples tested. Spinning tests have been made of a number of long staple upland cottons which show that careful breeders in the Carolinas have produced cotton almost equal in every respect to the long staple upland cotton of the Delta region of Mississippi. The Department is also investigating the relation between cotton buying and cotton growing, and it has already been shown that greater discrimination in buying will encourage the production of better grades, greater purity, and more uniformity of staple. An estimate of the Bureau of Crop Estimates, based on the crops of 1909 and 1910, shows the cost of producing the cotton lint in the United States for those years was 8.3 cents per pound, the value of the by-products not being considered. CRETE (CANDIA). A Mediterranean island south of Greece, constituting from 1898 until May 31, 1913, an autonomous state subject to the suzerainty of Turkey. The island has an area of 3327 square miles and a population, in 1911, of 344,001. The population in 1900, exclusive of 6113 foreigners, was 310,185, of whom 269,848 were Christian and 33,496 Mohammedan. In 20 years the Greek element has increased by over 62,000, and the Mohammedan decreased by nearly 40,000. The capital is Canea, with 25,185 inhabitants.

The chief industry is agriculture, and the leading product olive oil, which in part is used in the manufacture of soap. The average annual oil production is about 23,000 tons; soap about 3,155,000 kilos, valued at about 17,600,000 drachmas.

The annexation of Crete to Greece was declared on the eve of the Balkan War by the Greek premier Venezelos in 1912; in virtue of article four of the treaty of London, May 31, 1913, Turkey ceded Crete to the allied Balkan states. The union of the island with Greece was formally recognized by the other states by the treaty of Bucharest Aug. 10, 1913, and subsequently by the great powers. The governor-general in 1914 was Loukas Roufos Kanakaris, appointed Oct. 12, 1913.

CRICKET. The international match between the United States and Canada, scheduled for 1914, was postponed because of the European war. Two teams of American cricketers, however, made tours in England. Haverford College engaged in 16 games with the English players, winning four, losing 10 and drawing

two. The teams defeated by Haverford were Eton, Forest Hill, Uppingham and Rossall. The Merion Club of Philadelphia played nine games in England, winning four, losing two, and drawing three. The teams that bowed to the Philadelphians were Reigate Priory, Blackheath, Eastbourne, and Mitcham.

The American intercollegiate championship was won by the University of Pennsylvania. Oxford defeated Cambridge at Lords by 194 runs. Eton was victorious over Harrow by four wickets.

CRIDLER, THOMAS WILBUR. An American public official, died Feb. 23, 1914. He was born at Harper's Ferry, Va., in 1850. After studying law he was admitted to the bar, and in 1875 entered the United States Department of State as a clerk. In 1897 he was appointed by President McKinley third assistant Secretary of State, and held this office until Theodore Roosevelt became President. In 1900 he was special commissioner to the Paris Exposition. He traveled in the interests of the Department of State for several years preceding 1904.

CROCKETT, SAMUEL RUTHERFORD. A Scottish novelist, died April 20, 1914. He was born at Little Duchrae, Galloway, in 1860, and was educated at the Universities of Edinburgh and Heidelberg. At 19 years of age he attempted journalism in London. This was not successful, and he entered the Free Church of Scotland. In 1887 he was appointed minister of the Free Church at Penicuik. The publication of *The Stickit Minister* in 1893 at once brought him reputation as a writer in the Scotch tongue. This was followed in rapid succession by over 50 volumes, the best-known of which are: *The Raiders* (1894); *Joan of the Sword Hand* (1900); *The Dark o' the Moon* (1902); *Red Cap Tales* (1904); *Me and Myn* (1907); and *Princess Penniless* (1908). His last book was *The Moss Troopers*, published in 1912.

CROP REPORT. See **AGRICULTURE**, and under name of crop, as **CORN**, **RYE**, etc.

CROSBY, JOHN SCHUYLER. An American soldier and public official, died Aug. 8, 1914. He was born in Albany, N. Y., in 1839, and graduated from New York University in 1855. He served through the Civil War and was several times promoted for bravery. After its close he served as adjutant to Generals Sheridan and Custer in various Indian campaigns. In 1870 he acted as aid to General Sheridan, then Lieutenant-General. From 1876 to 1882 he was American Consul at Florence, Italy, and was governor of Montana Territory from 1882 to 1884. He served as First Assistant Postmaster General under President Cleveland from 1884 to 1886. He was a member of several patriotic societies.

CROSS, RICHARD ASSHETON, first VISCOUNT. An English statesman, died Jan. 8, 1914. He was born at Red Scar, in 1823, and was educated at Rugby and Trinity College, Cambridge, receiving his degree at the latter in 1846. He was called to the bar and for some years went the Northern Circuit. In 1857 he entered Par-

liament as a Conservative, and retained his seat until 1862, when he retired. Six years later he was returned, after a famous struggle, in which Mr. Gladstone was an opponent, as one of the two Conservative members for South-West Lancashire. In 1874 he became Secretary of State for the Home Department in Disraeli's Cabinet. Through his efforts several important measures were passed in Parliament, the chief of these being the Prisons Bill, which transferred a very important jurisdiction and responsibility from local authorities to the Imperial Government. When Lord Beaconsfield's Government resigned at the beginning of 1880, Mr. Cross was made G.C.B. He had been returned again for South-West Lancashire, and took a leading part on the side of the opposition during the second Gladstone administration. In 1885, when Lord Salisbury came into office, Cross resumed his former position at the Home Office. In 1886 he was appointed Secretary of State for India, and in the same year went to the House of Lords with a title of Viscount Cross. In 1895, when Lord Salisbury for the third time became Prime Minister, Lord Cross was included in the Cabinet as Lord Privy Seal. He continued to hold this office until 1900, when he ceased to be a Cabinet Minister. He was a strong personal friend of Queen Victoria, and was generally understood to be among the most trusted of her advisers in matters of business. His published writings include: *Acts Relating to the Settlement and Removal of the Poor* (1853); *The General and Quarter Sessions of the Peace* (1858).

CROSS COUNTRY RUNNING. The Senior Metropolitan Cross Country Championship Run for the second year in succession was won by Hannes Kolehmainen of the Irish-American A. C., his time being 36 minutes, 47 seconds. T. Barden of the Irish-American A. C. finished second and A. J. Fogel of the Irish-American A. C., third. The team scores were: Irish-American A. C., 40; Bronx Church House, 42; Mohawk A. C., 62; Columbia University, 121; Long Island A. C., 135; Yonkers Y. M. C. A., 155; Holy Family Lyceum, 164.

In the American intercollegiate cross country run held at New Haven, Cornell for the second year in succession was the victor. D. F. Potter, Jr., of Cornell, was the individual winner in 34 minutes $\frac{3}{4}$ seconds. D. S. Morrison of Princeton finished second in 34 minutes 6 seconds, and L. E. Wenz of Colby third in 34 minutes 9 $\frac{1}{2}$ seconds. The scores and order, at the finish, of the various colleges entered were: Cornell, 35; Harvard, 77; Yale, 91; Massachusetts Institute of Technology, 113; Pennsylvania, 114; Princeton, 129; Colby, 150; Dartmouth, 171; Brown, 195; Columbia, 214; College of the City of New York, 251.

The results of the principal amateur Marathons in 1914 were: Boston A. A., 25 miles, won by James Duffy of Hamilton, Canada, in 2 hours, 25 minutes 1 $\frac{1}{4}$ seconds; Missouri A. C., 25 miles, won by Sidney Hatch of the Illinois A. C. in 2 hours, 59 minutes, 43 seconds; modified Marathon, New York, 12 $\frac{1}{2}$ miles, won by Hannes Kolehmainen of the Irish-American A. C. in 1 hour, 9 minutes, $\frac{1}{2}$ seconds; London, won by Djebelia of France in 2 hours, 40 minutes, 50 $\frac{1}{2}$ seconds; Chicago, 10-mile road race, won by Sidney Hatch of the Illinois A. C.

The 10-mile A. A. A. Championship was won

by Hannes Kolehmainen of the Irish-American A. C. in 52 minutes, 47% seconds. Edward Renz of the Mohawk A. C. captured the 7-mile A. A. A. Walk Championship in 54 minutes, 13% seconds.

CUBA. A West Indian island republic. The capital is Havana.

AREA AND POPULATION. The estimated area is 44,164 square miles; another estimate is 45,881 square miles. The republic is divided into six provinces—Pinar del Río, La Habana, Matanzas, Santa Clara, Camagüey, and Oriente. The population, as returned by the census of Sept. 30, 1907, was 2,048,980; as estimated in 1913, 2,469,579. Population according to race in 1907: native whites, 1,224,539; foreign whites, 203,637; colored, 620,804 (of whom, 274,272 negroes, 334,695 mulattoes, and 11,837 Chinese). Marriages in 1911, 12,846; births, 74,286; deaths, 33,194. Immigration in 1911, 38,953; in 1912, 38,296, of whom 30,660 Spaniards, 2884 North Americans, 1269 Jamaicans. Emigration in 1911, 79,482; in 1912, 62,318; travelers arrived in 1911, 80,923; in 1912, 79,482; travelers departed in 1911, 80,921; in 1912, 62,318. The larger cities, with population according to the census of 1907: Havana, 297,159; Santiago de Cuba, 45,470; Matanzas, 36,009; Cienfuegos, 26,616; Cárdenas, 24,280; Sancti-Spiritus, and Santa Clara, about 17,000 each; Manzanillo, 16,000; Guantánamo, 15,000.

PRODUCTION AND COMMERCE. The staple crops are sugar and tobacco. Corn and sweet potatoes are important products. Large quantities of fruits are raised, notably, bananas, pineapples, oranges, and coconuts. The sugar crop for 1914 was estimated at 17,357,200 sacks, or 2,479,600 tons. Stock raising is an important industry. There are large mineral resources, especially in Oriente, including iron, copper, manganese, lead, zinc, gold, and salt.

Imports and exports in 1913 were valued at \$143,758,736 and \$164,823,059 respectively, as compared with \$125,902,241, and \$172,978,438 in 1912, and \$113,266,997, and \$123,136,379 in 1911. The leading imports include breadstuffs, meats, cotton goods, iron and steel, and machinery. Chief exports in 1911 and 1912 respectively: sugar, \$85,169,000, and \$102,034,000; tobacco, \$29,988,000, and \$30,457,000; iron ore, \$3,874,000, and \$3,910,000; woods, \$2,110,000, and \$2,264,000; fruits, \$1,836,000, and \$1,810,000. Trade by countries, thousands of dollars:

	Imports		Exports	
	1913	1912	1913	1912
United States ..	65,416	75,817	145,186	181,270
Other America...	10,251	10,624	5,280	5,580
U. Kingdom ...	15,898	16,072	11,466	18,427
Spain	9,775	10,080	659	657
Germany	8,481	9,874	6,199	4,708
France	7,706	7,828	2,575	1,685
Total, including others	128,202	140,065	164,809
Specie & bullion.	2,700	8,695	514
Total	125,902	148,759	172,978	164,823

There were entered at the ports in 1913, 1903 vessels, of which 1729 steam. Merchant marine

in 1911, 41 steamers, of 32,315 tons, and 121 sail, of 11,964 tons.

COMMUNICATIONS. In 1913 the length of railway in operation was 3806 kilometers (2365 miles). Telegraphs in 1912: 215 offices, with 8151 kilometers of line, and 9952 kilometers of wire. There is a considerable number of radio-telegraph stations. Post offices in 1912, 574.

The principal railway systems in Cuba in which British and American capital were largely invested were the following: The United Havana, 680 miles, the Cuban Central, 341 miles, and the Western Havana, 147 miles. These three form a group distinct from the Cuba Railroad which has 602 miles of track. In the year 1913 the United Group showed a decrease in both gross and net receipts, while the Cuba Railroad had an increase in receipts and was able to increase its dividends. The principal traffic on these railways is sugar and tobacco.

FINANCE. For the fiscal year 1912-13, the budget showed estimated revenue of \$37,940,000, and estimated expenditure of \$33,974,147; for the fiscal year 1914-15, \$41,828,580, and \$40,262,906. The latter budget showed estimated customs receipts of \$29,100,000; consular dues, \$670,000; receipts from posts and telegraphs, \$1,000,000; direct taxes, \$1,113,000; excise, \$3,600,000; lottery, \$3,200,000; other receipts, \$3,145,580. The larger estimated disbursements for the year 1914-15 were: administration (interior), \$11,042,249; public instruction, \$5,106,421; public works, \$5,101,666; public debt, \$4,457,963; sanitary service, \$4,264,388; department of finance, \$3,280,318. Public debt (1910), \$62,083,100.

GOVERNMENT. The executive authority is vested in a president, who, with a vice-president, is elected by indirect vote for four years. The legislative body is a congress of two houses, the Senate and the House of Representatives. The Senate consists of 24 members (four from each province), elected indirectly for eight years. The House consists of 83 members, elected by direct vote for four years. The president is assisted by a cabinet of eight members. On May 20, 1913, Gen. José Miguel Gómez was succeeded as president by Gen. Mario García Menocal for the four-year term. Vice-president, Dr. Enrique José Varona.

HISTORY. In January Dr. Pablo Desvernine y Galdos was appointed Secretary of State. As the result of a reunion in the Liberal Party, the Asbertist faction of dissident Liberals withdrew their support from President Menocal and the Conservative administration lost control of Congress. The Conservative Speaker, Señor Lanuza, resigned in order to make way for the Liberal candidate, Ibraham Urquiza, who was elected to the Speakership on August 31. In order to meet the financial difficulties caused by the war, the president asked Congress in August to authorize an increase of \$5,000,000 over the \$10,000,000 recently borrowed from J. P. Morgan & Co., and to tax the salaries of government employees, to tax sugar at the rate of 25 cents per 300 pounds, and to float a loan of \$3,000,000 on the strength of the new sugar tax.

An Amnesty Bill for the benefit of "veterans of the independence" charged with homicide and other offenses prior to Oct. 1, 1914, was twice passed, and twice held up by the United States

government, because the bill would have granted amnesty to Gen. Ernesto Asbert, and Congressman Arias, who were charged with the murder of Gen. Armando Riva, chief of the Havana police. Mr. Bryan, it was understood, held to the opinion that allowing "veterans" to commit murder with impunity was not consistent with Cuba's obligation to "maintain a government adequate to the protection of life and property." On December 9, however, the Cuban Senate voted an Amnesty Bill which included General Asbert but not Congressman Arias, and with the acquiescence of the United States this restricted Amnesty Bill was passed, since the burden of guilt was thought to rest more heavily upon the congressman than upon the former provincial governor. The tribulations of the Havana police were again brought to public attention when on the night of November 4 a body of soldiers killed three policemen and wounded four others. Apparently the bloodshed was the result of a plot, which, happily, had miscarried; for on the following day 65 soldiers were arrested for mutiny, and 30 odd for participation in the attack on the police. The elections which took place on November 1 were so scandalously vitiated by fraud, that an annulment of the result was confidently expected. See also *INTERNATIONAL ARBITRATION AND PEACE, Bryan-Wilson Treaties.*

CUBISM. See *PAINTING AND SCULPTURE.*

CULLOM, SHELBY MOORE. Former United States Senator from Illinois, died Jan. 28, 1914. He was born in Wayne County, Ky., in 1829, and when he was one year old his parents emigrated to the then new State of Illinois. He acquired a moderately complete education in the common schools. As a young man he worked on the farm, taught school, and studied law. When he was 21 years of age he met Abraham Lincoln, who was then a rising lawyer in Springfield. Cullom wished to study law in Lincoln's office, but the latter at the time was too busy riding circuit to take a student. Instead he found the young man a good position where he was able to study law, and encouraged him in other ways. When Cullom was finally admitted to the bar in 1855, Lincoln continued to assist him and he was soon elected city attorney of Springfield. At the expiration of his term he resumed the practice of law. He took a great interest in the politics of the time and was a delegate to the convention which saw the birth of the Republican party. In 1856 he was elected to the State Legislature and served in that body again in 1860-1, 1872, 1873-4. In 1861 and in 1873 he was Speaker of the House. In 1860 he was a delegate to the convention which nominated Abraham Lincoln. From that time until 1912 he was the most distinguished representative from Illinois at subsequent Republican national conventions. He was elected to the Thirty-ninth Congress in 1865 and was reelected to successive Congresses up to and including the Forty-first in 1871. In 1862 he was appointed with George S. Boutwell and Charles A. Dana to pass upon the accounts of the United States quartermaster and commissary officers. In the Republican National Convention of 1872 he nominated General Grant in a speech containing about 80 words. It is probable that the demonstration that followed has never been surpassed in any subsequent convention. In addition to General Grant, Senator Cullom placed two other

Presidents of the United States in nomination at the respective conventions, and was many times under serious consideration as a nominee for the presidency himself. From 1876 to 1883 he was Governor of Illinois, but resigned in the latter year to become United States Senator. He continued to serve in the Senate until March 3, 1913. In his national legislative career Senator Cullom was the author of some important laws. He secured the passage of the first measure to regulate interstate commerce, and was a chairman of a committee of five senators which investigated the question of interstate commerce throughout the country. For many years he served as chairman of the Committee on Foreign Relations. Senator Cullom was a candidate for reelection in 1912 in spite of the fact that he was 83 years of age. He was defeated in the primaries by Lawrence W. Sherman. He was in the public service for nearly 57 years and his career was interwoven with that period of United States history beginning five years before the Civil War and ending on March 3, 1913, when he retired from the Senate. In personal appearance Senator Cullom greatly resembled Lincoln and this was the source of great pride in him throughout his life. During the last months of his life he served as a member of the commission on the Lincoln Memorial. Throughout his entire public career no breath of scandal or suspicion ever touched him and he retired from public life poorer financially than when he entered. Several years before his death he published an interesting volume of reminiscences which contained much valuable information relating to the history of his time.

CUMBERLAND PRESBYTERIAN CHURCH. In 1913, as a result of the litigation between this denomination and the Presbyterian Church in the United States, the former was obliged to surrender its publishing house in Nashville. It saved for itself, however, its books, plates, and periodicals. Shortly after this action the members of the denomination subscribed \$12,500 to purchase machinery for a new publishing plant. A sufficient amount of this subscription was promptly paid in to purchase a plant of such efficiency as to enable the church to publish its weekly paper, the *Cumberland Presbyterian*, issued from Nashville, Tenn.; also its Sunday School literature of which it issued more than 200,000 pieces annually. The church during the year carried on a campaign to place its doctrinal and historical books in the homes of the people. Revivals were also carried on during 1914. The total membership of the denomination is estimated by its authorities at 120,000.

CURAÇAO. A Netherlands West Indian colony, composed of the islands of Curaçao (212 square miles), Bonaire (Buen Ayre), Aruba, St. Martin, St. Eustatius, and Saba; total area, 436 square miles, with a total population Dec. 31, 1910, of 54,469; Dec. 31, 1912, 55,153. Export of phosphate in 1911, 3028 cubic meters from Curaçao, and 27,658 cubic meters from Aruba. Export of raw gold, from Aruba, 70,697 kilos, valued at 113,115 florins. Total imports 1912, 3,890,123 florins; exports, 2,425,541 (3,430,626, and 1,952,330 in 1911). Vessels entered in the 1912 trade, 1428, of 2,713,000 cubic meters' capacity at Curaçao and 1745, of 184,000 cubic meters' capacity at other

ports. Estimated revenue 1914, 711,000 florins; expenditure, 1,070,000 (678,000, and 1,252,000 in 1913; 719,000, and 1,126,000 in 1912). Subvention 1914, 365,000 florins. The governor was Dr. Th. J. A. Nuysens.

CURRELL, WILLIAM SPENSER. An American educator, elected in 1914 president of the University of South Carolina. He was born in Charleston, S. C., in 1858, and graduated in 1878 from Washington and Lee University, where he took post-graduate studies and received the degree of Ph.D. From 1882 to 1886 he was professor of English at Hampden-Sidney College, Va., and held the same chair at Davidson College, N. C., from 1886 to 1895. He was professor of English and Modern Languages at Washington and Lee University from 1895 to 1899, and was professor of English from the latter year until his election as president of the University of South Carolina. Dr. Currell was for many years a lecturer of English at Chautauqua Assemblies, etc.

CURRENCY. See MONEY; BANKS AND BANKING; FINANCIAL REVIEW.

CYCLING. Frank L. Kramer in 1914 won the professional cycling championship for the 13th consecutive year although he had to face some of the best European talent. Harry Kaiser gained fame by winning the amateur title after a bitter struggle with William Hanley of California and others. No sooner had Kaiser's ambition been realized than he jumped into the professional ranks and took part in the six-day race at Madison Square Garden, New York, where he finished, paired with George Cameron, in sixth place.

The Australian cyclists, as in 1913, proved the most successful rivals of the Americans. Alfred Goulet was the most proficient of the foreigners, for in addition to finishing second to Kramer for the professional sprinting championship, teamed up with Alfred Grenda of Tasmania, he won the annual six-day race held in Madison Square Garden, New York. The pair covered a distance of 2758 miles, 1 lap, breaking all previous records.

Six teams were tied for first place when the race was completed and carrying out a new rule the last hour of riding was devoted to a series of sprints, points being awarded on the Berlin system. The Australians amassed a total of 67 points. Peter Drobach and Ivor Lawson were second in the race, Reggie McNamara and Jimmy Moran third, and Oscar Egg and Francesco Verri fourth.

Walter Rutt, the German champion, who won several six-day races at the Garden in former years, joined his country's colors when the European War started.

The world's championships which were to have been held in Copenhagen, Denmark, were declared off because of the war.

CYMARIN. A neutral, nonglucosidal substance obtained from *Apocynum cannabinum* L. and *Apocynum androsaemifolium* L. Cymarin occurs as colorless, thick, prismatic crystals, having a bitter taste. It is slightly soluble in cold water, more soluble in hot water. It dissolves easily in acetone, alcohol, chloroform, but is sparingly soluble in benzene, ether, and carbon disulphide. Experiments on animals show that cymarin is about equal in activity to strophanthin, which it resembles closely in its pharmacologic characteristics. It is more ac-

tive when given intravenously or injected into the muscles than when taken by mouth. Poisonous doses cause emesis through the action on the vomiting centre in the medulla. Cymarin is a cardiac stimulant acting like digitalis.

CYPRUS. A Levantine island, formerly a nominal part of the Ottoman Empire, but occupied by Great Britain under the convention of June 4, 1878, and annexed in 1914. Capital, Nicosia. From 1489 until 1571 Cyprus belonged to the republic of Venice, being conquered in the latter year by the Turks, who continued in possession of it until for administrative purposes it was ceded to England in 1878. It is, after Sicily and Sardinia, the largest island in the Mediterranean, with an area of 3584 square miles. Total population, census of 1911, 274,108. About 25.9 per cent of the population are Mohammedans, the bulk of the population belonging to the native Cypriote Church. The Cypriote Church, though in communion with the Orthodox Greek Church, has been autocephalous since the fifth century.

The island is divided into six administrative provinces, as follows: Nicosia, with 81,497 inhabitants; Famagusta, 58,530; Larnaca, 29,737; Limassol, 46,084; Paphos, 38,508; Kyrenia, 19,752. The principal towns are Nicosia, the capital, with 16,052 inhabitants; Larnaca, with 9262; Limassol, 10,302; Famagusta, an almost ruined town now being rebuilt, with 1233 inhabitants; Varosia, 3599; Ktima, 3091; Kyrenia, 1726.

The ancient copper mines for which Cyprus was renowned have long been abandoned, and the chief occupation of the people has come to be the cultivation of the soil, but agriculture has been greatly retarded by reason of the lack of water. Irrigation works were completed in 1901, and a plan for storing water has been carried out under the direction of the department of public works. Cereals, carobs, cotton, linseed, aniseed, and vegetables are grown; live stock is raised for export. Wine and spirits find a good market in Egypt and Turkey. Much damage has been done by locusts, forest fires, and the large number of goats in the island. Gypsum and asbestos are mined.

There are Mohammedan and Greek-Christian schools. During the school year 1912-13 there were 390 Greek-Orthodox elementary schools, with 26,137 pupils, receiving aid amounting to £4770; and 155 Mohammedan elementary schools, with 5212 pupils, receiving aid amounting to £1340. There are other endowed and private schools, and several secondary schools.

Since the British occupation, suitable provision has been made for lepers in the asylum near Nicosia. The total number of lepers in the island (census of 1911) was 101, of whom 65 were males.

The value of all imports in 1912 was £602,345, against £547,772 in 1911; exports, £728,988, against £626,557 in 1911. These values are exclusive of specie. Among the principal exports were carobs, £251,750; live stock, £79,082; barley, £60,882; wine, £45,355; raw cotton, £40,085; raisins, £31,940; other fruits, £21,079; silk cocoons, £20,026; hides and skins, £11,771; wool, £11,362; wheat, £18,528. Tonnage entered and cleared during 1912-13, 644,363, of which 117,813 tons British; during 1911-12, 758,502, of which 113,873 tons British.

Revenue and expenditure 1912-13, £334,685, and £258,661 respectively; 1911-12, £319,572, and £235,256. Grant-in-aid, £50,000 annually. There are no navigable waterways. A narrow-gauge railway connecting Famagusta with Nicosia (36 miles), opened in 1905, was subsequently extended to Morphou, a total distance of 60 miles. A cable connects with Alexandria, and there are 240 miles of telegraph wire. The government is administered, under the Colonial Office, by a high commissioner (Major Sir Hamilton John Gould-Adams), assisted by executive and legislative councils.

HISTORY. The participation of Turkey in the great War of the Nations in 1914, and the resulting declaration of war issued against Turkey by Great Britain (November 5), furnished the British government with an occasion for the definite annexation of the island. Since the year 1878 Cyprus had been nominally still a part of the Ottoman Empire, actually occupied and administered by the British. In November, 1914, however, an Order in Council was issued annexing the island to His Majesty's Dominions, "in order that proper provision may be made for the government and protection of the said island." The annexation of Cyprus to the British Empire was a bitter disappointment to the numerous Greek-speaking inhabitants, many of whom had persistently demanded the union of Cyprus with Greece. By affiliation of language and national sentiment, certainly the Cypriotes were more closely bound to Greece than to Great Britain. Even in May, 1914, a petition to the King (of Great Britain and Ireland) was drawn up by the Cypriotes, affirming that while they were grateful for the benefits already conferred upon their island by Great Britain, they would be still more grateful if Great Britain would hand Cyprus over to Greece, and thus gratify the "natural, eternal longing of a part of the Greek race which is, upon the whole, grateful to Great Britain,—the yearning to be united to the consanguineous Greek Kingdom." "Give back, great King," they pleaded, "this happiness to the Cypriote people, who were provisionally placed under your liberal and glorious sway, that they may bless the name of your exalted grandmother from generation to generation. God Save the King!" The grievance of the Cypriote Greeks was an injury to their nationalist sentiment rather than actual misgovernment. Indeed the British could point with something like pride to the reformed law courts, the more equitable system of taxation, the 800 miles of metalled roads, the sanitary provisions, the quays, the harbor improvements, the fine public buildings, and the quasi-representative Legislative Council (in which nine Greek Christian and three Mohammedan elective members sat with six official or appointive members). These considerations, while they served somewhat to mollify the Cypriotes, could not be alleged as Great Britain's reason for the annexation. The central fact in the case was this: that the British government desired Cyprus as a naval post of great strategic value in the eastern Mediterranean, and was willing therefore to annex the island in direct defiance of the hope which the Cypriote Greeks fondly cherished of uniting their island to Greece.

CYRENAICA. See TRIPOLI.

DAHOMÉY. One of the colonies composing

the French West Africa government-general. The capital is Porto Novo, with about 40,000 inhabitants; Abomey has 10,732; Ouidah (Whydah), 13,000; Cotonou, 1954. The chief products for export are palm kernels, palm oil, corn, live animals, copra, and cotton. The total imports for 1912 were valued at 20,310,098 francs—cotton 5,423,947, beverages 2,482,817, tobacco 1,038,128, petroleum 781,395, wooden wares 833,027, metals 640,619, etc. The total exports were valued at 21,451,317 francs—palm kernels 13,398,416 fr., palm oil 6,361,320, dried fish, 304,670, live animals 155,713, corn 325,036, copra 105,263, kola nuts 48,420, etc. A railway is in operation from Cotonou as far as Savé, a distance of 261 kilometers. This line will eventually reach the Niger at a point near Kari-mana. It will have an ultimate length of 748 kilometers. There is a branch line from Cotonou to Segboroué, by way of Ouidah. A light railway connecting Porto Novo with Sakete traverses a region rich in palms and well cultivated. A branch is under construction to Pobé. See FRENCH WEST AFRICA.

DAIRY FARMING. See DAIRYING.

DAIRYING. SUPPLY OF DAIRY PRODUCTS. The value of dairy products in the United States was somewhat higher in 1914 than in 1913, due in part to a slight increase in production and in part to higher price levels. The increase in milk production was not a noticeable one, as for several years it has not been keeping pace with the consumption of milk and its products. The number of dairy cows is increasing at about the rate of 15 per cent, while the population is increasing 21 per cent. It is true that the increased production per cow makes up in part for this deficiency, but on the other hand, the consumption of milk and its products per capita tends to increase so that each year sees an increase in the imports of dairy products. The consumption of dried milk, condensed milk, ice cream, and fermented milk drinks is on the increase and new uses for casein and other milk products in the arts are constantly being found. Dairying seems to be declining in some sections of New York and New England, but in the Northwest and in the South more interest is taken in it than ever before.

Throughout the country farmers have been paid the same or somewhat higher prices for milk than in 1913, and with the exception of butter the price level of milk products has been higher than ever before. The cost of producing milk has been constantly advancing for a number of years, and each year the producer and dealer are forced to adopt more sanitary methods to meet the demands of the inspector of market milk. In all dairy sections more silos have been built than ever before. The cow-testing-association movement has also been spreading rapidly.

The dairy industry suffered to some extent from the outbreak of the foot-and-mouth disease. (See VETERINARY MEDICINE.) For a time it prevented many dairymen who produced market milk from buying cows and thus decreased temporarily their supply to regular customers. The quarantine of the cattle exhibited at the National Dairy Show at Chicago caused no little annoyance and pecuniary loss. A much greater loss than this is sustained every year by dairymen from tuberculosis in their herds. A

significant movement to prevent this was the quarantine of five counties in northeastern Illinois on October 1. Under the terms specified by the Federal and State authorities, no cattle can be shipped from those counties for dairy or breeding purposes unless accompanied with an official certificate showing that they have successfully passed the tuberculin test. This action was caused by the practice of some owners and dealers who had been in the habit of issuing health certificates for cattle that were obviously diseased. This being known to buyers in general, it created a suspicion of all Illinois cattle.

There was an attempt to enforce a city ordinance in Milwaukee, Wis., requiring that all milk come from tuberculin-tested herds. This resulted in a strike of milk producers and new supplies had to be obtained for a time, thus throwing the entire milk trade of the city into confusion.

In some respects, it has been an interesting year for the dairy interests, as many big records of milk yields have been made by the Holstein, Guernsey, Jersey, Ayrshire, Brown Swiss, and Red Polled breeds. Tilly Alcatraz, a five-year-old Holstein cow in California, made a new world's record of milk. On November 13 she completed a yearly record of 30,342.6 pounds of milk, containing 951.3 pounds of fat, equivalent to 1189.12 pounds of butter. The seven-year-old Guernsey cow, May Rilma, also exceeded all previous records of butterfat; her yield of milk was 19,639.58 pounds, which contained 1059.59 pounds of fat. Soon after making this record May Rilma was sold at a public auction for \$5010, a price higher than had ever before been paid for a Guernsey. King Segis Pontiac Chicago, a bull calf, was sold to a syndicate for \$20,000, a record price for a Holstein.

MARKET MILK. One of the greatest wastes in the dairy industry is the distribution of market milk. Representatives of the Federal Department of Agriculture found that in the city of Washington the average distances covered each day by 100 milk wagons was 19.1 miles. If all the milk wagons of the city traveled that distance, every mile of the city would be covered $6\frac{1}{2}$ times a day.

Another tremendous waste is that of lost and broken milk bottles. According to figures which 40 dealers furnished to the Department of Agriculture, a milk bottle lasts on the average about 22 trips. If these estimates are representative of conditions throughout the trade, dealers must obtain a new supply of bottles every three weeks, and if they cost $3\frac{1}{2}$ cents each, a milk dealer who delivers 10,000 bottles a day must spend \$15.55 daily or \$5575.75 a year to replace broken and lost bottles. To avoid this excessive breakage, there is an increase in the use of single-service milk bottles made of paper.

New types of steel refrigerator cars were built during the year by several railroad companies for use in long hauls of milk and cream to supply the city trade.

Each year the pasteurizing of market milk has grown in favor, especially when milk is obtained from herds not tuberculin tested, or when the milk comes from doubtful sources. One objection urged against pasteurizing was its cost, but a study of a number of pasteuriz-

ing plants by the U. S. Department of Agriculture shows that it costs only about .313 cents for a gallon of milk and .634 cents for a gallon of cream. Laboratory tests by the Department have shown that the process of bottling pasteurized milk while it is still hot, and then cooling with a forced draft of air, has so many advantages that the method will prove to be economical and efficacious on a commercial scale. It prevents reinfection during the process of bottling and is much cheaper than pasteurizing in bottles. The milk can be bottled at 145° F., using bottles which have been steamed for two minutes just previous to filling.

It has also been demonstrated that the flavor of garlic may be removed from milk by blowing air through it at a temperature of 140° to 145° F.

IMPORTS OF DAIRY PRODUCTS. Until within a few years cheese was the only dairy product imported into the United States in any large amount; but the imports of milk and all kinds of milk products have been increasing for some time, especially since the passage of the Underwood Tariff Act of 1913. The effect on domestic prices, however, has been hardly noticeable except in the case of butter. The past year butter has been imported from Canada, Argentina, Australia, New Zealand, Denmark, Sweden, Finland, and Siberia. Much of it has been of inferior quality, and since the outbreak of the European War these imports have practically ceased. Canada is sending considerable milk and cream over the border to be made into butter in the United States. The value of the dairy products imported during the fiscal year ended June 30, 1914, was as follows: Cheese \$11,010,693, butter \$1,753,461, milk, cream, and condensed milk \$2,639,034, as compared with \$9,185,184, \$304,090, and \$1,203,833, respectively, in the previous year. The increase is due in part to the tariff and in part to the fact that production in the United States is not keeping up with consumption. Probably about 25,000,000 pounds of cheese, or over one-third of that imported, was of the Swiss variety, and 8,000,000 pounds were Gorgonzola. The import of nearly all kinds of foreign cheese ceased after Aug. 1, 1914.

DAIRYING IN FOREIGN COUNTRIES. The cheese industry is declining at the present time in Canada, in spite of the government's efforts to encourage it. Cheese makers say they can not pay the prices offered by the creameries for raw milk and cream. In Eastern Canada the growth of cities has also increased the demand for market milk, and the present United States tariff has opened a new market for Canadian milk. In Western Canada dairying is in a flourishing condition. To prevent fraud the government issued new regulations for marking butter and cheese.

Each year marks an advance in the dairy industry of Argentina. In February there was organized at Buenos Aires a national dairy association, having as its object the promotion of the industry throughout the republic.

The dairy industry in Europe and the international trade in dairy products have been seriously interfered with by the European War. An immediate effect was a temporary decrease in the export of finely flavored cheeses from France. The ultimate effects of the war can

not be foretold, but undoubtedly it will cause a large decrease in the number of dairy cattle in central Europe.

The Sixth International Dairy Congress was held in June at Berne, Switzerland. Besides lectures and discussions on dairy topics, there were special demonstrations covering all phases in the preparation of the milk and the making of Emmental cheese. The significance of lactic-acid bacteria, standards for cheese, and the use of the products were among the subjects for discussion by the delegates, but the milk supply of cities received the largest amount of time, as that seems to offer more serious problems at the present time than any other phase of the dairy industry.

INVESTIGATIONS. It has been found possible to prepare Cheddar cheese for market by packing in one-pound tins at the press. Good cheese of the Swiss type can be produced at any season of the year by the use of pure cultures of *Bacillus bulgaricus*, or with mixed cultures from old cheese. The peppery taste of Roquefort cheese has been found to be caused by certain volatile acids of the group insoluble or partly soluble in water. It has been found possible to make from cow's milk a Roquefort cheese closely approximating the texture and flavor of Roquefort made from sheep's milk. A method of making American Camembert practically equal in quality to that imported has been worked out. It has been ascertained that unripened cheeses, such as cream and Neufchatel, have so much sugar that they can not be used as food for diabetics, while ripened cheeses of the Cheddar, Swiss, and Limburger types are entirely free from sugar. Although oxalic acid, an active poison, is produced by many molds, it is not produced by the molds prevalent in Limburger and Roquefort cheeses. The growth of a typical Roquefort mold is controlled by the supply of oxygen available in the interior of the curd.

Investigations on casein have demonstrated that the essential difference between buttermilk casein, which could not be used for paper coating, and skimmed milk casein, which answered every purpose, was due to the presence of fat, salts, and other impurities in the former. When these were removed by proper washing, the casein obtained from buttermilk equaled the best made from skimmed milk. A simple method has been devised for the thorough washing of buttermilk curd, formerly a difficult process. It has been found possible to make a condensed skimmed milk suitable for ice cream manufacture by the blowing process. Palmer and Eckles, of the Missouri Experiment Station, have shown that the yellow pigment in milk comes from the feed of the cow, and is not synthesized in the body of the animal, as hitherto supposed.

LITERATURE. The following is a list of some of the important publications of the year: Ayers and Johnson, "Pasteurization in Bottles and the Process of Bottling Hot Pasteurized Milk," in *Journal of Infectious Diseases* (Chicago, March, 1914); J. T. Bowen, "Application of Refrigeration to the Handling of Milk," in *U. S. Department of Agriculture Bulletin* 98 (Washington, 1914); J. N. Currie, "Flavor of Roquefort Cheese," in *Journal of Agricultural Research* (ib., April, 1914); W. Ernst, *Textbook of Milk Hygiene*, trans. by Mohler and Eickhorn

(Chicago, 1914); Evans, Hastings, and Hart, "Bacteria Concerned in the Production of the Characteristic Flavors in Cheese of the Cheddar Type," in *Journal of Agricultural Research* (Washington, June, 1914); Friedel and Keller, *Deutsche Milchwirtschaft* (Halle, 1914); T. L. Haecker, "Investigations in Milk Production," in *Minnesota Experiment Station Bulletin* 140 (St. Paul, 1914); O. F. Hunziker, *Condensed Milk and Milk Powder* (Lafayette, Ind., 1914); Palmer and Eckles, "Carotin, The Principal Natural Yellow Pigment of Milk Fat," in *Missouri Experiment Station Research Bulletins* 9-13 (Columbia, Mo., 1914); Rabild, Risser, and Parks, "Homemade Silos," in *U. S. Department of Agriculture Farmers' Bulletin* 589 (Washington, 1914); H. D. Richmond, *Dairy Chemistry* (London, 1914); Thom, Currie, and Matheson, "Studies of Roquefort, Camembert, and Neufchatel Cheese," in *Storrs Agricultural Experiment Station Bulletins* 78, 79 (Storrs, Conn., 1914); G. S. Thompson, *British and Colonial Dairying* (London, 1914); U. S. Department of Agriculture, "The Production of Clean Milk," in *Farmers' Bulletin* 602 (Washington, 1914); T. E. Woodward, et al., "Making and Feeding Silage," in *U. S. Department of Agriculture Farmers' Bulletin* 578 (ib., 1914).

DAMS. The highest earth dam on record was under construction during 1914 by the Spring Valley Water Company to retain the water of a new reservoir for the San Francisco, Cal., water supply. It was to have a maximum height of 240 feet above bed rock, and a sectional thickness at the base of 1312 feet, and at the top of 25 feet, while the crest was to be 1260 feet in length. There is no core wall, but unusual care was to be taken in depositing the various materials entering into the composition of the dam. Naturally this material is deposited by sluicing

ELEPHANT BUTTE DAM SITE, SHOWING FLUME, DAM, AND CONSTRUCTION LAYOUT.

(From *Engineering News*.)

and hydraulic fill. The dam will add to the Spring Valley Water Company's reservoir a storage capacity of 53,000,000 gallons. It is located in the wide valley of Calaveras Creek in Alameda County, 36 miles southeast of San Francisco. Previous to this construction the highest earth dam on record was the Necaxa Number 2, at Necaxa, Mexico, which had a finished height of 192 feet.

Another notable dam completed during 1913 and in operation in 1914 was located on the

Bow River in Alberta, and consisted of an earth embankment 7000 feet long, and 35 to 0 feet high, with an Ambursen hollow reinforced dam 750 feet between abutments, and 39 feet high to the crest, with 24 openings each 27 feet, provided with Stoney gates 11 feet high, and a reinforced concrete headwork at right angles to the dam proper with five 20-foot openings closed by Stoney gates 14 feet high. This dam is located about 100 miles southeast of Calgary, and is part of the irrigation system of the Canadian Pacific Railway. It is known as the Bassano Dam, and is designed to pass 100,000 second feet of water with 14 feet on the crest. The dam was built on a stratum of clay, beneath which was sand containing water under slight pressure. It is especially noteworthy for the unusually great depth of water which must be passed over its crest during seasons of flood, being one of the most notable overfall dams now in existence.

LONGITUDINAL AND CROSS SECTION OF THE ELEPHANT BUTTE DAM.

In 1914 the Elephant Butte Dam, which formed a part of the greatest irrigation enterprise in America, was rapidly nearing completion, so that water could be impounded during the winter and spring of 1914-15. This dam is 1200 feet in length, with a maximum height of 300 feet, and a maximum width at the base of 215 feet, and impounds in its reservoir 2,642,292 acre feet, or 862,000,000,000 gallons. The irrigation project will bring under cultivation 180,000 acres of land, 155,000 of which are in southern New Mexico and Texas. The reservoir formed by this dam will be 45 miles in length, submerging 40,000 acres of land, making an artificial lake which is the largest of its kind in the world. The design of the dam is a cyclopean concrete masonry structure, and the cost of the project was \$7,200,000.

On November 2 the Cedar River Dam for water supply for the city of Seattle, Wash., was ready, and two days later the rock tunnel was completed. This dam is 160 feet in height, with a length at the crest of about 1000 feet, and it forms a storage basin with a capacity of 5,200,000,000 cubic feet. The expenditure for the work was \$1,470,000. A new dam across the Colorado River at Austin, Texas, was completed during the year, being of the hollow reinforced concrete type, 1235 feet in length, and impounding water at a height of 65 feet above the normal low water level. A portion of the old dam about 560 feet in length was used in the construction after the foundations had been strengthened and made impervious to a depth

of 18 feet below water by grouting under pressure. The old dam failed in April, 1900, owing to defective foundations.

The city of Watervliet, N. Y., to protect itself from periodic inundation by water from the rolling land above the city, built two reservoirs with outlet works which will be normally dry, but which will protect the city by impounding temporarily the rainfall causing spring freshets. This project involved the construction of an earth dam across Dry River, the main dam being an earth-fill across the upper end of a rock gorge, where the valley broadens out into an earth basin—this gorge being at the point selected 40 feet wide, but increasing to a width of 500 feet at the greatest elevation, 85 feet above the bottom. The crest of the dam is 20 feet thick, the upstream slope is one on 2½, and the downstream slope one on 2. The berms, 8 feet wide, are built on both slopes at the mid-height, and tile drains carry the drainage to the toes of the slope, while the lower part of both slopes is paved. A reinforced concrete core wall 8 inches thick, with a base 3 feet wide, goes down into the rock. Supplementary to the upper dam and over a mile below is a second dam, constructed of reinforced concrete 25 feet in height, and 105 feet along its crest. This small reservoir receives the discharge from the tower, which is a feature of the upper dam, and takes the place of a regulating works. In case of freshet the water impounded by the dam is discharged through a special conduit to the Hudson River.

One of the dam failures of the year occurred on October 23, when a concrete dam built by the Horseshoe Mining Company across the Trinity River near Trinity, Cal., was carried away by flood waters, the central half of the structure being broken off. This dam was 357 feet in length, with a maximum height of 22 feet, the maximum base width being about 7 feet, and narrowing to 20 inches on the crest. The failure was thought to be due to the application of pressure to the green concrete.

In Austria there was in progress notable construction to control the flood waters of the Elbe River in northern Bohemia. One project known as the Königreich Walde reservoir involved the construction of a dam on the Elbe River just above Königinhoff. This project controls a drainage area of 200 square miles, and furnishes a reservoir extending 4.5 miles upstream from the dam, covering an area of 222 acres to a maximum depth of 98.5 feet, and impounds 320,887,000 cubic feet of water. The dam contains 124,100 cubic yards of broken stone masonry, is 136 feet high, 23.6 feet wide on the top, 124 feet wide on the base, and 735 feet long on the crest, being arched upstream. It is built of unusual strength to protect important towns lying downstream, and during the construction the river was carried around the dam site in two tunnels 19.7 feet in diameter, bored through solid rock. These tunnels will be closed by bulkheads through which will pass 43½-inch pipes so that the water may be used to generate power. A short distance below the town of Spindelmühle, 21.4 miles above the Königreich-Walde reservoir dam, another basin, known as the Krausebauden reservoir, is to be built. It will have a capacity of 119,401,400 cubic feet, of which 88.05 per cent will be kept impounded for flood storage. This dam contains 65,450

cubic yards of broken stone masonry, and is 136 feet high, 16.4 feet wide on top, and 118.2 feet wide on the base. It is arched upstream and has a crest length of 492 feet. These reservoirs are two of the six projects that were built by the River Regulation Commission in Bohemia, and before the outbreak of the war 23 projects were decided on, which would control a total drainage area of 1730 square miles, and would reduce the maximum floods on the main Elbe by about 1.3 feet. The total cost of the 23 projects was estimated at \$12,100,000, and the dams that were built or under construction in 1914 involved a cost of \$2,503,000. These dams were for the most part of the massive masonry construction, characteristic of such European works.

Another interesting dam construction during the year was the Hindia Dam on the Euphrates River in Asiatic Turkey, 47 miles south of Bagdad. It was designed by Sir William Willcox, who built the Assuan Dam in Egypt, and is a part of the large irrigation scheme prepared by him in 1909 for the Turkish government. This dam was being built on a site consisting of fairly hard silt, which was dense enough to stand up vertically when excavated. Under the dam there was a footing of concrete three feet thick, and 72 feet, 2 inches in width. On this concrete brick work was built 6½ feet in depth, and 65 feet, 7 inches in width, and on this foundation the piers of the dam were built. The plan used was to place the dam east of the original river bed, and then to erect an embankment across the river, so as to change its course. The area covered by the works was enclosed by interlocking sheet piling. At one side of the dam there is a lock, and a head regulator is maintained, so that the ordinary summer level of the river will be raised by about 16 feet, 6 inches, and thus an ample supply of water will be diverted into the Hilla channel, which had been previously silted up. See WATER SUPPLY.

DANBURY HATTERS' CASE. See BOYCOTT.

DANISH LITERATURE. See SCANDINAVIAN LITERATURE.

DANISH WEST INDIES. A colony of Denmark comprising three islands with a total area of 139 square miles and (1911) 27,086 inhabitants (12,508 males, 14,578 females). The population in 1901 was 30,527; in 1841, 40,955. The islands are: Saint Croix, 84 square miles and (1911) 15,467 inhabitants; Saint Thomas, 33 and 10,678; Saint John, 21 and 941. The capital is Charlotte Amalie, on Saint Thomas, with 8247 inhabitants in 1911; Kristianssted, on Saint Croix, had a population of 4592. The inhabitants are chiefly negroes engaged in sugar culture. The sugar export from Saint Croix in 1910-11 amounted to 10,664 metric tons; in 1911-12, 10,023; in 1912-13, 6063. The Governor in 1914 was L. C. Helweg-Larsen.

DARTMOUTH COLLEGE. An institution of higher learning, at Hanover, N. H., founded in 1769. The number of students enrolled in the several departments of the university in the autumn of 1914 was 1392; the summer session of 1914 included 228 students, and the faculty numbered 123. Frank Maloy Anderson, of the University of Minnesota, replaced Sidney Bradshaw Fay as professor of history, the latter going to Smith College. There were several noteworthy benefactions received during the year, among which was the establishment of the

Edward Tuck Foundation for Instruction in the Language and Literature of the French People, and \$42,000 for Tuck Drive, both given by Edward Tuck; a \$5000 scholarship given by B. J. Blakslee; and several tracts of land given by John E. Johnson. The productive funds of the college amount to \$3,900,000, and the total income from all sources to \$480,000. The library contains 125,000 bound volumes and 25,000 pamphlets. The president is Ernest Fox Nichols, LL.D.

DAUGHERTY, JEROME. An American Roman Catholic priest and educator, died May 24, 1914. He was born in Baltimore in 1849, and studied under the Jesuits at Loyola College in that city. In 1865 he was admitted to the Society of Jesus, and in 1872 taught mathematics at Georgetown University. He studied theology at Woodstock College, and was ordained to the priesthood in 1880. For the two years following he taught at St. Francis Xavier College in New York City, and for the two years following this was prefect of studies at Boston College. In 1884-5 he taught at Loyola College in Baltimore, and then for four years was vice-president of Gonzaga College in Washington. He was appointed vice-president at Georgetown University, but resigned this post to go to Holy Cross College, and in 1901 he was called to New York, where he became assistant to the provincial of the Society of Jesus. In 1901 he was appointed President of Georgetown University, but was obliged to retire on account of ill health in August, 1905. During his presidency the college buildings were increased by the Ida Ryan Hall and the Ryan gymnasium, a new wing of the university hospital, the Hirst library, and the Kober operating amphitheatre. He also added a fourth year to the law school course of the University, introduced lectures in ethics into the medical school, and established a dental college.

DAVIS, COMMISSIONER KATHARINE B. See FEMINISM.

DAVIS, GEORGE BRECKINRIDGE. An American soldier, died Dec. 16, 1914. He was born in Ware, Mass., in 1847, and graduated from the United States Military Academy in 1871. Before entering the Academy, however, he had served in the Civil War and had risen to the rank of second-lieutenant. He was honorably mustered out of service on June 26, 1865. In 1871 he was appointed second lieutenant in the Fifth Cavalry and was promoted through successive grades until he became major and judge-advocate in 1888. In 1895 he was appointed lieutenant-colonel and deputy-judge advocate-judge. From 1895 to 1901 he was professor of law and history in the United States Military Academy. He was appointed colonel and judge-advocate in 1901, and brigadier-general and judge-advocate-general of the United States army in the same year. He retired with the rank of major-general in 1911. He served as delegate to several peace conferences and he was a well-known authority on international law. Among his writings were: *Elements of International Law* (1887); *Elements of Law* (1897); *Military Law* (1898); *Military Laws of the United States* (1907); *Elements of International Law* (1908).

DAVIS, HENRY WILLIAM BANKS. An English animal painter, died in December, 1914. He was born at Finchley, Aug. 26, 1833, and was

educated at Oxford, in the Royal Academy Schools, and at Boulogne-sur-Mer. He became an associate of the Royal Academy in 1873, and also of the Paris Société Nationale des Beaux-Arts in 1892. He served on juries at exhibitions in Paris (1889 and 1900), and at Chicago (1893), and on other international art juries. At the Royal Academy he exhibited "The Banks of the Upper Wye," and "Flow'ry May" in 1897, and "Apple-Blossom," "Upper Wye," and "British Wild Cattle" in 1903. His reputation depends chiefly upon his skillful treatment of pastoral scenes and especially of cattle and animal subjects. His best paintings include: "A Panic" (Fonthill House); "Summer Afternoon" (Sheffield Gallery); "Returning to the Fold" (1880); "Approaching Night" (1899); and "Contentment" (National Gallery). During his earlier period Davis did much work in sculpture, a "Galloping Bull" (1872) being perhaps the best example.

DAYTON FLOOD PREVENTION. See FLOOD PREVENTION.

DEATH RATE. See MARRIAGE AND DIVORCE, *Matrimony and Death Rate*; and VITAL STATISTICS.

DEGAS. See PAINTING AND SCULPTURE.

DE LA REY, JACOBUS HENDRIK. A Boer soldier, died Sept. 16, 1914. He was born in 1848. The conditions of Boer life in South Africa at that time resulted in a continual state of warfare against native tribes by the Boers, and De la Rey's experience as a fighter and leader of the fighting men resulted from these conditions. In the Anglo-Boer War in South Africa he was one of the most daring and successful of the Boer leaders in the field. His personal bravery was famous among both Boers and British. Long before the war, however, he had been recognized as one of the trusted leaders of his people. In the politics of the South African Republic he followed the moderate lead of General Joubert. In the more recent history of the Transvaal he took a silent but loyal part as a lieutenant of General Botha. His death resulted from accidental shooting in Cape Town.

DELAWARE. POPULATION. The estimated population of the State on July 1, 1914, was 209,817. The population in 1910 was 202,322.

AGRICULTURE. The area, production, and value of the principal crops in 1913-14 are shown in the following table. The figures are from the United States Department of Agriculture, and those of 1914 are estimates only.

	<i>Acres</i>	<i>Prod. bu.</i>	<i>Value</i>
Corn	1914 197,000	7,092,000	\$4,897,000
	1913 197,000	6,206,000	3,662,000
Wheat	1914 114,000	2,337,000	2,547,000
	1913 113,000	1,688,000	1,441,000
Oats	1914 4,000	108,000	54,000
	1913 4,000	122,000	62,000
Rye	1914 1,000	18,000	17,000
	1913 1,000	14,000	11,000
Potatoes	1914 11,000	880,000	616,000
	1913 11,000	957,000	718,000
Hay	1914 72,000	a 79,000	1,343,000
	1913 72,000	94,000	1,476,000

a Tons.

MINERAL PRODUCTION. The only mineral products of the State are derived from its quarries, clays, sand and gravel pits, and sales of potable waters. The total mineral production increased from \$425,360 in 1912, to \$541,542 in 1913. The chief item of increase was in the output of stone. The principal clay product is com-

mon brick, with small quantities of front brick. The total value of the clay products increased from \$162,216 in 1912, to \$187,280 in 1913.

TRANSPORTATION. The railway mileage of the State in 1913 was about 335. Practically no construction has been done in recent years.

EDUCATION. The total school population of the State is about 50,000, with an enrollment of about 36,000, and an average daily attendance of about 23,000. The teachers employed number about 1000, of whom about 860 are women. Expenditures for schools approximate \$650,000 a year.

CHARITIES AND CORRECTION. There is no State board which has supervision over charitable and correctional institutions in the State. The Associated Charities of Wilmington has a direct or indirect supervision over many philanthropic institutions. These include: the Home for Friendless Children, the Home for Aged Women, St. Joseph's Home for Orphan Colored Boys, Florence Crittenden Home, Delaware Industrial School for Girls, Home of Merciful Rest, and the Layton Home for Colored Persons. These are all in Wilmington. In addition there are the Home for Aged Women at Dover, the Ferris Industrial School for Boys at Marshalltown, the Delaware Hospital for the Insane at Farnhurst, Newcastle County Hospital at Farnhurst, and the work house and jails in the several counties. The Delaware State Tuberculosis Commission has general charge of the work for the prevention and cure of this disease.

FINANCE. According to the treasurer's report for the fiscal year 1914, the total receipts from all sources for that period amounted to \$685,273 and the disbursements to \$716,653. There was a balance on hand at the beginning of the year of \$45,797 and at the end of \$14,418. The chief sources of revenue are railroad, corporation, and franchise taxes, and the chief expenditures are for State charitable and educational institutions and State officers. The bonded debt of the State in that year was \$826,785.

POLITICS AND GOVERNMENT. There was little of political interest in 1914. The Legislature did not meet, as the sessions are biennial, and the last was held in 1913. The November elections were for Representative in Congress and for State Treasurer and State Auditor. The Republicans elected Thomas W. Miller to the House of Representatives by a vote of 22,922, compared with 20,681 for the Democratic candidate, Franklin Brockson, and also elected a State Treasurer and a State Auditor. Kent and Sussex Counties went Democratic, but a largely increased Republican vote in Wilmington resulted in the election of Miller. As a result of the election the Legislature is Republican on joint ballot by 28 to 24 Democrats.

STATE OFFICERS, 1915. Governor, Charles R. Miller, Rep.; Secretary of State, Thomas W. Miller, Rep.; Lieutenant-Governor, Colen Ferguson, Dem.; Attorney-General, Josiah O. Wolcott, Dem.; Banking and Insurance Commissioner, William R. McCabe, Dem.; State Treasurer, William J. Swain, Rep.; State Auditor of Accounts, Charles J. Luff, Rep.

SUPREME COURT: Chancellor, Charles M. Curtis, Rep.; Chief Justice, James Pennewill, Rep.; Associate Justices, Thomas B. Heisel, Dem.; Herbert L. Rice, Rep.; William H. Boyce, Dem.; Clerk, Wilbur D. Wilds, Dem.

STATE LEGISLATURE, 1915.

	<i>Senate</i>	<i>House</i>	<i>Joint Ballot</i>
Republicans	9	19	28
Democrats	8	16	24
Republican majority	1	3	4

The representatives in Congress will be found in the section *Congress*, article UNITED STATES.

DELAWARE & HUDSON R. R. STRIKE.

See RAILWAYS.

DE LEON, DANIEL. An American socialist labor leader, died May 11, 1914. He was born in Curaçao, West Indies, in 1853. He studied at several European universities and in 1872 removed to the United States. From 1886 to 1891 he was lecturer on Latin-American diplomacy at Columbia. In 1888 he joined the Knights of Labor, and in 1895 as a result of a division in that organization, he formed the Socialist Trade and Labor Alliance of which he was an officer until its consolidation with the Industrial Workers of the World. He was active in the Nationalist Movement and also supported Henry George for mayor of New York City in 1886. In 1890 he joined the Socialist Labor party, becoming editor of its English organ. From 1892 he was editor of the *Weekly People* and from 1900 edited the *Daily People*, both Socialist papers published in New York.

DE LEON, THOMAS COOPER. An American author and editor, died March 19, 1914. He was born in Columbia, S. C., in 1839, and was educated at private schools and at Georgetown University. From 1858 to 1861 he was auditor of the Topographical Engineering Bureau at Washington. In the latter year he removed to the South and enlisted in the Confederate Army. He served throughout the war and at its close became editor of the *Cosmopolite Magazine* in Maryland. In 1866-67 he was engaged in newspaper and magazine work in New York City, and from 1868 to 1876 was managing editor and sole editor of the *Mobile Register*. Following this he edited several other papers in the South. He originated and conducted several carnivals in southern cities, including Mobile, Pensacola, Vicksburg, and Baltimore. From 1897 until his death he was engaged in magazine writing and the writing of novels. From 1903 he was totally blind. He was the author of: *Cross Purposes* (1869); *Creole and Puritan* (a novel, 1889); *A Fair Blockade Breaker* (1891); *Four Years in Rebel Capitals* (1893); *Crag Nest* (1898-1910); *Confederate Memories* (1899); *Belles, Beaux and Brains of the 60's* (1907). He also wrote many poems and short stories.

DENISON, HENRY WILLARD. An American lawyer and diplomat, died July 3, 1914. He was born in Guildhall, Vt., in 1846, and received an academic education at Lancaster, N. H. He afterwards studied law at Columbian, now George Washington, University. At the same time he held a clerkship in the State Department, but this he resigned and secured a consular clerkship at Yokohama. At this time Japan was beginning to yield to the march of civilization and Denison, not content with his consular duties, spent all of his spare time in the study of international law. Some important cases came to him and his treatment of them was so thorough that his talents were soon brought to the attention of the Japanese For-

eign Office. In 1880 he was invited to join the permanent staff of the office as Minister of Foreign Affairs. Mr. Denison saw Japan rise from comparative obscurity to become a great world power, and Japanese statesmen have not been slow to recognize that a great deal of their country's progress was due to the American who was a friend and confidential adviser of emperors, and of the men who guided Japan through her most serious troubles. There was not an important foreign affair in Japan in the last thirty years in which the legal adviser to the Department of Foreign Affairs did not have a controlling hand. In the dangerous days of the war with Russia he was always at the side of Count Mutsu, then Minister of Foreign Affairs. At the end of the war he was summoned to the Japanese court, where he received a handsome grant of money and the personal thanks of the royal family. His next great service was as adviser to the Japanese government in the negotiations for the first treaty alliance with Great Britain. He is also said to have been the author of the remarkable correspondence from Tokio which preceded the war with Russia. Mr. Denison was practically unknown except to the diplomats of the world until the time of the Portsmouth Peace Conference. It was then generally perceived that he was and had long been the power behind the Japanese throne. At Portsmouth he represented Japan in drafting the treaty of peace with Russia, and the work he did was so noteworthy that he was recognized as the foremost figure in diplomacy, and the Emperor conferred upon him a high decoration. In an official statement issued after his death he was called one of the greatest benefactors of Japan. His appointment as legal adviser to the Japanese Foreign Office dates from May 1, 1880, and continued until the time of his death. He was a member of the Permanent Court of Arbitration of The Hague.

DENMARK. A country in northern Europe, between the North and the Baltic seas; a constitutional monarchy. Its capital is Copenhagen.

AREA AND POPULATION. The area and population by insular and mainland divisions are shown in the following table, the area being given in square kilometers, population according to the census of Feb. 1, 1911, with comparative figures for 1840:

	<i>Sq. km.</i>	<i>Pop. 1911</i>	<i>Pop. 1840</i>
<i>Islands:</i>			
Seeland	7,498.84	1,096,897	468,477
Bornholm	1,587.53	142,885	25,199
Lolland-Falster	1,791.28	115,658	71,402
Fyn	8,474.16	308,179	188,857
<i>Jutland:</i>			
Southeast J.	7,320.70	482,264	217,656
Southwest J.	10,788.20	364,620	170,459
North J.	7,563.54	351,573	157,025
Total Denm'k proper	38,968.70	2,757,076	1,289,075
Faroe Islands	1,898.90	18,000	7,814
Total	40,867.60	2,775,076	1,296,889

The males in 1911 numbered 1,337,900, and the females 1,419,176. The rural population numbered 1,647,350, an increase of 81,765 over that of 1906; the urban population numbered 1,109,726, a gain of 86,392 over that of 1906. The total population as estimated July 1, 1912, numbered 2,800,000. Average density per 100

square kilometers for Denmark proper, 7075. The marriages in 1911 numbered 19,879; living births, 73,938; still births, 1751; deaths, 37,232. Emigration over seas in 1912, 8366—5965 to the United States.

Agricultural pursuits in 1911 occupied 1,003,803 persons, both active and dependent; industrial pursuits, 752,203; the professions, 141,909; commerce and transportation, 458,030. Copenhagen (Köbenhavn), covering 28 square miles, had in 1911, 462,161 inhabitants (with the suburb Frederiksberg, 559,398); Frederiksberg, 97,237; Aarhuus, 61,755; Odense, 42,237; Aalborg, 33,449; Horsens, 23,843; Randers, 22,970; Esbjerg, 18,208; Vejle, 17,261; Fredericia, 14,228; Kolding, 14,219; Helsingør, 13,783; Svendborg, 12,667; Nykøbing, 11,010; Viborg, 10,885.

EDUCATION. Primary education is free and compulsory between the ages of 7 and 14; the schools are maintained by local taxation. The secondary schools are maintained or aided by the State. There are many special schools, the most numerous being horticultural and agricultural. There is a university at Copenhagen. There were in 1912, 3431 communal schools, with 381,879 pupils, and 9697 teachers. The University of Copenhagen, founded in 1479, has five faculties, to all of which women are admitted on equal terms with men. From 400 to 500 students matriculate annually. The Lutheran is the established religion; complete religious toleration prevails.

PRODUCTION. Of the total area, 80 per cent is productive, and one-sixth of the remainder is in peat bogs. The law prohibits the condensation of a number of small farms into one estate; the soil is therefore greatly subdivided. Less than one-half the productive area is under crop, the remainder being forest, pasture, and meadow. The total crop area in 1907 was 3,896,870 hectares, distributed among principal crops as follows: 1,122,761 hectares under cereals, 308,362 under roots, 27,247 under industrial plants, 1,229,585 under grasses (including meadows, pasture, and forage plants), 230,413 fallow, 978,502 under other crops, including gardens, parks, etc. The table below gives area in hectares sown to main crops in 1912-13 and 1913-14, with the yield in quintals for both years, together with the yield per hectare in 1912-13:

	Hectares		Quintals		Qs.
	1912-13	1913-14	1912-13	1913-14	
Wheat	54,044	54,044	1,822,078	1,279,178	33.7
Rye	245,786	245,786	4,318,513	4,788,294	17.6
Barley	241,409	241,409	5,956,184	4,974,452	24.7
Oats	428,887	428,887	8,290,168	6,729,225	19.4
Beets*	82,870	80,900	9,800,077	6,018,361	287.8
Potatoes	61,141	61,141	10,697,378	7,770,217	175.0

*Sugar beets.

Figures for 1913-1914 are subject to revision.

Dairying is an important industry. In 1911 there were 681 creameries in operation, with 104,557 work people; the milk employed was from 605,208 cows, with an average production of 2570 kilos of milk per cow. The live stock estimate of July, 1910, returned 535,018 horses, 2,253,982 cattle, 726,829 sheep, 40,257 goats, 1,467,822 swine.

INDUSTRIAL ENTERPRISES in June, 1906, numbered 12,379, employing 104,435 persons, in the capital; 20,236, employing 98,585, in provincial towns; 52,627, employing 114,066, in the rural communes. The value of the fisheries products

for 1911 was given at 15,230,200 kroner, of which 9,844,000 kroner were for fish from the waters south of Skagen. The beet-sugar mills numbered nine in 1912, with a total production of 134,670 metric tons. There were 26 margarine factories, with a total output of 39,820 metric tons.

COMMERCE. The general and special trade by great classes in 1912 is shown in the table below with value in thousands of kroner:

	Imports		Exports	
	Gen.	Spec.	Gen.	Spec.
Provisions	251,699	211,488	560,557	518,791
Raw products	318,986	287,021	99,176	66,966
Manures, etc.	118,721	110,877	12,460	9,889
Fuel	67,070	66,888	288	17
Other*	71,036	68,791	9,651	1,560
Total	817,512	740,015	682,082	596,723

* Includes goods for personal and household use.

Totals for the general and special trade for the three years previous to 1912 are shown below in thousands of kroner:

	General		
	1909	1910	1911
Imports	725,087	684,407	705,500
Exports	608,081	548,074	626,761
	Special		
	1909	1910	1911
Imports	566,782	577,166	628,814
Exports	448,822	485,874	586,647

The principal articles of import for home consumption in the 1911 trade are given as follows, with values in thousands of kroner: Cereals, 92,693; oilcake, 56,282; coal, 45,276; iron manufactures, 35,419; wood, 28,869; fibre manufactures, 20,305; woolen manufactures, 19,237; coffee, 17,880; skins, 11,981. Exports of domestic produce, values in thousands of kroner: Butter, 192,783 (89,577,100 kilos); meats, 137,222; animals, 61,919; eggs, 29,366; skins, 12,709; barley, 10,276; fish, 7831; ships, 5372; iron manufactures, 3647.

In the table below are shown the principal countries of origin and destination in the general trade for 1912:

	Imports	Exports
Germany	814,286	181,646
United Kingdom	185,887	873,104
Sweden	69,060	38,852
Norway	9,166	18,641
Russia	56,179	16,847
Netherlands	20,863	5,270
Belgium	9,902	1,726
France	19,406	8,802
Colonies	9,990	7,510

There were entered at the ports in the 1912 trade, 38,667 vessels of 4,387,258 tons cargo; cleared, 30,339 vessels of 1,623,077 tons cargo. The merchant marine included Dec. 31, 1912, 3294 vessels of 506,624 registered tons, of which steamers 642, of 415,436 tons.

COMMUNICATIONS. At the end of 1912 there were 2303 miles of railways in operation, of which 1214 miles were State-owned. Cost of construction to March 31, 1912, 288,579,344 kroner. There are 4213 miles of highways, and 22,506 miles of byways. Length of State telegraph wires, March 31, 1913, 8081 miles; offices, 179; railway offices, 395. Telephone wires, 303,405 miles. Post offices, 1137.

NAVY. The fleet, maintained for purposes of coast defense, includes an old battleship, a cruiser, some small craft, and four monitors, three torpedo gunboats, fourteen first-class torpedo boats, and three submarines. Five torpedo boats and two submarines were building in 1913.

FINANCE. The monetary unit is the krone, par value \$0.26799. Revenue and expenditure for comparative years are shown in the table below in kroner (A—receipts running account; AA—receipts from capital; B—expenditure running account; BB—expenses charged to capital):

	1910-11	1911-12	1912-13
A	91,853,855	102,102,426	114,175,582
AA	52,083,143	69,833,162	80,342,814
Total rev..	143,436,998	171,985,588	194,518,396
B	103,755,040	107,802,849	106,332,288
BB	36,741,102	66,954,710	83,601,075
Total			
Exp.	140,496,142	174,757,559	189,938,363

Details of the budget for 1914-15 are shown in the table below, in thousands of kroner:

Rev.	1000 kr.	Exp.	1000 kr.
Ind. taxes	62,383	War	18,850
Direct taxes	37,736	Worship, etc. ..	16,018
Interest	7,565	Interior	14,987
Separate rev.	6,648	Debt	14,571
Real estate	4,581	Interest, etc.	12,274
Posts & tels.	2,155	Marine	9,935
Lotteries	1,516	Justice	9,950
Domains	1,071	Finance	7,862
		Other	15,211
Total	123,606		119,457
The public debt stood March 31, 1913, at 858,040,928 kroner.			

GOVERNMENT. The executive vests in a King, aided by responsible ministers. The King in 1914, Christian X, succeeded his father to the throne of Denmark, May 14, 1912. He was born Sept. 26, 1870; he married, April 26, 1898, Alexandrine, Duchess of Mecklenburg. The prince royal is Christian Frederik Michael, born March 11, 1899. Another son was born July 27, 1900—Knud Christian. The legislative authority resides in the Rigsdag, which consists of an upper house of 54 elected and 12 nominated members, and a lower house of 114. The ministers may vote only in the chamber of which they are members, but have free access to both houses. The ministry appointed June 21, 1913, was composed as follows: C. T. Zahle, premier and minister of justice; E. Scavenius, foreign affairs; O. Rode, interior; P. Munch, defense; E. Brandes, finance; S. Keiser-Nielsen, public instruction and worship; K. Pedersen, agriculture; J. H. Juergensen, public works and commerce (ad int.).

ARMY. Denmark maintains an active militia with permanent cadres, so that on a war footing some 90,000 men could be turned out. Service is compulsory beginning at 21 years of age and lasting for 16 years. The recruits on joining are drilled continuously for 165 days in the infantry, 280 days in the field artillery, 1 year in the garrison artillery, 200 days in the cavalry, and various terms for the technical troops. In some cases the training is extended, but after the first period there are only brief annual exercises each year. The organization is in two territorial commands, one including Copenhagen

and the first and second Zealand brigades, and the other the Funen brigade and the first and second Jutland brigades. There are 15 regiments of infantry of 53 battalions in all, 4 regiments of cavalry, 2 regiments of field artillery, with 20 4-gun batteries, 4 garrison artillery battalions, and 3 battalions of engineers. The five brigades making up the field army would have an apparent fighting strength of 50,000. The effective strength of the cadres of officers and noncommissioned officers and horses of the permanent strength, according to the budget for the fiscal year 1914-15, was as follows: 13 generals, 95 colonels and lieutenant-colonels, 268 captains, 384 lieutenants, 1663 noncommissioned officers, and 3269 horses. The budget for the fiscal year 1914-15 amounted to 18,348,963 crowns.

HISTORY. On June 9 the Folkething passed by 102 votes to 6 a bill for the amendment of the Constitution in accordance with the report of a joint commission of the Folkething and the Landsting. In the Landsting, the Conservative groups, being opposed to the measure, by their absence deliberately prevented a quorum. Nevertheless a division was taken and the 33 members of the Left voted "aye," while 32 Conservatives were absent. The president of the Landsting, as a matter of course, ruled that the vote was insufficient and invalid unless more than half the 66 members voted. The premier, M. Zahle, threatened to dissolve the Landsting. A few days later a State Council was held, and it decided to dissolve the Landsting in compliance with M. Zahle's request, although in obedience to the King it refused to concede M. Zahle's contention that the 12 members nominated by the King, as well as the 54 elective members, should be deprived of their mandates.

On June 29 the elections began for the 54 elective seats. Five members of the Right lost their seats, so that the new Landsting was constituted as follows: 20 Conservatives, 5 Free Conservatives, 20 Left, 5 Radicals, and 4 Socialists. As 9 of the 12 appointed members were favorable to the Constitutional Reform, there was now a majority of 38 to 28 for the bill abolishing the property qualifications for the elections to the Landsting and depriving the Crown of the right to nominate 12 members.

In May, Prince Harald, the younger brother of the King, acted as regent while the royal family voyaged to England on the royal yacht, accompanied by two Danish warships. From May 9 to May 13, King Christian was entertained in London, banqueting at Buckingham palace, attending a gala performance at the opera, and receiving the decoration of the Order of the Garter. Subsequently he visited Brussels, Amsterdam, and Paris, where he was received with equal courtesy and entertained with even more lavish hospitality. In connection with the great European War, it should be noted that Denmark, commanding the natural entrance to the Baltic Sea, occupied a strategic position of tremendous importance; and also that the serious interruption of traffic in the North Sea, as the result of British and German naval operations, inflicted grave injury upon Danish commerce. For the three-cornered peace agreement between Denmark, Norway, and Sweden, see SWEDEN. See also INTERNATIONAL ARBITRATION AND PEACE, Bryan-Wilson Treaties.

DENNIS, JAMES SHEPARD. An American

Presbyterian missionary, died March 21, 1914. He was born in Newark, N. J., in 1842 and graduated from Princeton in 1863. He then studied at the Princeton Theological Seminary, graduating in 1867. In 1868 he was ordained to the Presbyterian ministry, and in the same year became a missionary in Syria. He remained in that country until 1891. From 1873 to the latter date he was principal of, and professor at, the Theological Seminary at Beirut. From 1892 until his death he was an honorary member of the Syria Mission. He was a member of the Presbyterian Board of Foreign Missions, and was secretary to the board of trustees of Syrian Protestant College. In 1910 he was a member of Commission No. 1 at the World Missionary Conference in Edinburgh. He was a member of many historical, scientific, and patriotic societies. His published writings include: *Foreign Missions after a Century* (1893); *Christian Missions and Social Progress* (1897, 1899, 1906); *Centennial Survey of Foreign Missions* (1902); *The New Horoscope of Missions* (1908). He also wrote several theological treatises in the Arabic language, and was joint editor of the *World Atlas of Christian Missions* (1911).

DENTAL SCHOOLS. See UNIVERSITIES AND COLLEGES.

DENTISTRY. In August the Sixth International Dental Congress was held in London, the president, J. Howard Mummery, presiding, and 2000 delegates being present. Sir R. J. Godlee read a paper on oral toxæmia; Mr. Norman Bennett one on "The effects of dental treatment on national health and physique"; and there were other significant papers and addresses. The British Dental Association tendered the congress a reception at the Natural History Museum, South Kensington. American events of the year were the following: The annual meeting (July 1) of the Pennsylvania State Dental Association, at which Dr. Michael F. Barrett read a notable paper on his discovery of the germ of pyorrhea; the annual convention, with installation of officers, of the National Dental Association, held in July; and the annual meeting (July 11) of the Mouth Hygiene Association, at which there were addresses by Dr. E. H. Levinaky-Corwin, Dr. E. G. Routzahn, and others, and at which Dr. H. W. Wiley was chosen president, and a plan formed for the appointment of a commission to revise the regulation of the society.

DEPARTMENT STORES. See ARCHITECTURE.

DE PAUW UNIVERSITY. An institution for higher learning, founded in 1837 at Greencastle, Ind. There were in 1914, 972 students in all departments, with 42 members of the faculty. The productive funds amount to about \$925,000, and the annual income to about \$105,000. The library contains about 45,000 volumes. The president is George Richmond Grose, D.D.

DÉROULEDE, PAUL. French poet, author, and patriot, died Jan. 30, 1914. He was born in Paris in 1846 and was educated at the Lycée Louis le Grand and at Versailles. He studied for the bar and obtained a degree, and after practicing for two years he gave up law to become an officer in the French army at the outbreak of the Franco-Prussian War. He was captured at the Battle of Sedan and was taken to Germany, but escaped and served with dis-

tinction in the campaign of the valley of the Loire. He took part in the two sieges of Paris, the first against the Germans as a defender, and the second as an aggressor against the Commune. Déroulède was a nephew of Emile Augier, and in 1872 he first appeared as a poet under the patronage of his uncle with *The Songs of a Soldier*. This volume met with great success and was followed by a second, after which his reputation was established. His principal dramatic work was *Hetman*, a drama in five acts in verse. This was produced in 1877 at the Odéon. It met with instant success and had a large number of performances. Déroulède was an ardent patriot; he was active in politics, and his fearless writings in the daily press involved him in many controversies, and duels. When General Boulanger made his attempt to bring about a revision of the Constitution in 1889, Déroulède warmly supported his cause. Eleven years later he was banished from France on account of his activities in the Nationalist campaign and he remained abroad for five years. He was then pardoned and returned to France. He served as Deputy from Angoulême and was for a time the head of the League of Patriots.

DESMOULIN, FERNAND. A French painter, engraver, and philanthropist, died July 16, 1914. He was born in 1853. In 1885 he won honorable mention at the Salon and received a medal of the third class in 1889. He also won medals at the World's Columbian Exposition at Chicago, the Lyons Exposition and other expositions. He was a chevalier of the Legion of Honor. In Paris he was known as the "lay prison chaplain" because of his interest in prisoners and ex-convicts. He visited and helped the inmates of the city's prisons and often continued to help the convicts after they had been released.

DE VINNE, THEODORE LOW. An American printer, died Feb. 16, 1914. He was born at Stamford, Conn., Dec. 25, 1828. After learning the printing trade at Fishkill, N. Y., he was employed on the Newburgh (N. Y.) *Ozette*. In 1849 he became an employee of Francis Hart of New York, was junior partner in the firm in 1857-77, and after Hart's death changed the firm name to Theodore L. De Vinne & Co. (1883) and finally to the De Vinne Press. His establishment on Lafayette Street, equipped as a model plant, gained an international reputation for the quality of its presswork. *St. Nicholas* and the *Century Magazine* were printed by the firm from the date of their founding (1873, 1874). De Vinne was a leader in the improvement of typography, and founded the National Typothetæ Society, of which he was elected president in 1896. He contributed to the *NEW INTERNATIONAL ENCYCLOPEDIA*; and published: *Printer's Price List* (1869); *The Invention of Printing* (1876); *Historic Printing Types* (1886); *Christopher Plantin* (1888); *Plain Types* (1890); *The Practice of Typography* (1900); *Correct Composition* (1901); *Title Pages* (1902); *Modern Methods of Book Composition* (1904); *Notable Printers of Italy during the Fifteenth Century* (1910); and many magazine articles on similar subjects.

DIAMONDS. The diamond mining industry in 1914 was badly demoralized by the war in Europe, as a consequence of which some of the largest producers ceased operations. The prin-

cial centres of the cutting industry are Antwerp and Amsterdam, while the greater proportion of the crude stones for gem purposes comes from the Transvaal and Orange River colonies, with a smaller supply from German Southwest Africa. The new mines in Arkansas have not afforded any large quantity of stones. A shipment of some importance from the Belgian Congo called attention to this field as a possible rival in the future for the supremacy long held by South Africa, as according to recent accounts the beds in the Congo country are extensive and quite promising, consisting of both alluvial and volcanic deposits. One of the volcanic pipes under exploration has an area of 45 acres, and there are many others which were to be tested when conditions became more settled. The discoveries lie mainly in the Katanga and Kasai River regions. See GEMS AND PRECIOUS STONES; MINERALOGY.

DIAMONDS, ARTIFICIAL. See CHEMISTRY, INDUSTRIAL.

DIESEL ENGINE. See INTERNAL COMBUSTION ENGINES.

DIETETICS. See FOOD AND NUTRITION.

DILLON, JOHN FORREST. An American jurist, died May 5, 1914. He was born in Northampton, N. Y., in 1831. At the age of seven he removed with his parents to Davenport, Iowa. He worked his way through the Medical School of the University of Iowa, at which he graduated in 1850, but after six months' practice of medicine he gave it up to study law. In 1852 he was admitted to the bar, and in the same year was chosen prosecuting attorney of Scott Co., Iowa, serving until 1858, when he was elected judge of the seventh judicial district of Iowa. In 1863 he became a judge of the Iowa Supreme Court and in 1869 was appointed judge of the United States Circuit Court for the eighth judicial district. He resigned from the Federal bench in 1879 to become professor of real estate and equity jurisprudence at the Columbia Law School in New York City. In 1882 he resumed private practice, acting as general counsel for the Union Pacific Railroad, the Missouri Pacific Railroad, the Western Union Telegraph Company, and the Texas Pacific Railroad. He represented all the interests held by the Gould family, and after the death of Jay Gould, continued as counsel for these interests. He was also counsel for the Interborough Rapid Transit Company of New York City. He was a well-known authority on municipal corporations, and his work on the subject, *Municipal Corporations*, met with great success. He prepared a fifth edition of this work in five octavo volumes when he was 79 years of age. Other legal writings include: *United States Circuit Court Reports*; *Removal of Causes from State to Federal Courts*; *Municipal Bonds*; *Laws and Jurisprudence of England and America*; and *Life, Character and Judicial Services of Chief Justice Marshall*. He received the degree of LL.D. from Iowa College and Cornell College.

DIPHTHERIA. Behring's diphtheria vaccine, notice of which appeared in the YEAR BOOK for 1913, was used in a large number of cases during 1914, but principally in Germany. Kissling used the new vaccine in the Hamburg General Hospital to immunize 310 children who had been exposed to diphtheria. This was done during an unusually virulent epidemic. Of the 310 children thus protected only 8 contracted

diphtheria. Among the 111 who were given a second injection no cases whatever contracted the disease. Further trials were made of the preventive qualities of Behring's vaccine in the Magdeburg Municipal Hospital at Sudenburg. Here about 500 children were vaccinated by physicians of the hospital in six small towns and villages in a district where diphtheria prevailed in epidemic form. None of these children, it was stated, contracted diphtheria, although the disease continued epidemically in this vicinity. Apparently no bad results were observed. Von Behring's vaccine was said to be a mixture of a powerful diphtheria toxin with antitoxin, combined in such proportions that the resultant serum possesses a slight surplus of the toxin. The remedy appears to confer an active and relatively long period of immunity, while antitoxin confers only a short and passive immunity. See ANTITOXIN.

DIRIGIBLES. See AERONAUTICS.

DISASTERS AT SEA. See SAFETY AT SEA.

DISCIPLES OF CHRIST. There are two branches of this denomination, the Disciples of Christ proper and the Church of Christ. The first is the more important of the two. In this branch of the denomination there were in 1913, 1,362,711 communicants, with 9076 churches and 5592 ministers. The Church of Christ had about 157,000 communicants, 2700 churches, and 2100 ministers. The churches of the denomination lie chiefly in the Middle West and in the South, though it is represented in nearly every State in the Union. Churches are also found in Australia and other parts of Great Britain, in Cuba, Canada, Scandinavia, and the Philippines. There are about 10,000 Bible schools with an enrollment of about 900,000 children. The denomination has under its auspices 30 schools and colleges. Missionary work is carried on in several countries in Asia, in Hawaii, Cuba, and the Philippines.

DIVORCE. See MARRIAGE AND DIVORCE.

DOCKS AND HARBORS. During the year construction was active on the 1000-foot piers in the North River at New York City. There was in process of construction a pier 150 feet wide and 1000 feet in length at the foot of West 46th Street, with a berth to the north and to the south, and a half pier on the northerly side of West 44th Street 1000 feet in length, with a 1000-foot berth to the north. This work involved one of the largest and deepest cofferdams ever built, when the shore end of the site of these piers was being laid bare for excavation. This cofferdam was made up of continuous cells of steel sheet piling somewhat similar in construction to that used at Black Rock Harbor, in Buffalo, and around the wreck of the *Maine* in Havana. In the North River, however, the sheet piling cells were backed up by a heavy filling of riprap, so that the backs of the piling virtually formed the seal of the cofferdam, and were held in place by this fill. The contract under way in 1914 was for placing about 3500 tons of steel in the cofferdam, and 99,000 cubic yards of riprap in the embankment, the removal of 76,000 cubic yards of rock, and the placing of 14,000 cubic yards of concrete masonry. The basin created by the cofferdam covered an area

of about 800 feet in length, about 300 feet in width, and involving about 55,000,000 gallons of unwatering. This improvement was one of the most notable for the city of New York and was the beginning of much needed extension of the port facilities.

ORE DOCK AT DULUTH. During the year there was under construction at Duluth, Minn., the foundations of the largest ore shipping dock in the world, it being the fifth and latest ore shipping dock of the Duluth, Missabe and Northern Railway Company. The foundations were 2146½ feet in length, and contained 24,225 cubic yards of concrete. The dock was to have a storage capacity sufficient to load 14 vessels with 8000-ton cargos of ore. On the inside of the dock 4½ feet of concrete capping was placed on 14,600 round piles, while on the outside faces the concrete was 7½ feet thick increasing in height by three one-foot spaces. Between the two outer rows of round piles steel interlocking sheet piles 40 feet long were driven 6 inches below low water around the entire dock, to retain the sand pumped in from the bay and filled to within 18 inches of low-water mark. The concrete-capped piles, with the mile of sheet steel piling enclosing the sand fill, will support ore bins holding 112,000 tons. The columns for the dock were raised on 395 concrete pedestals, 5 feet square on top. The construction of this dock involved a special concrete-handling plant.

SAN FRANCISCO DRY DOCK. During the year a contract was made between the United States government and the Union Iron Works Dry Dock Company of San Francisco, whereby a \$2,000,000 dry dock was to be built in San Francisco Harbor under the guaranty that the government would furnish at least \$50,000 business each year for six successive years. The length of the new dock was to be 1096 feet over-all, breadth between the vertical walls 120 feet, breadth to the top of altars 140 feet 8 inches, and depth from mean high water to top of sill 42 feet 6 inches. The dock will be closed by an outer caisson floating and sliding into a transverse recess at the side of the concrete structure. The foundation will be of solid rock and the structure of reinforced concrete, designed to withstand earthquake shocks. The dock with the tunnels for flooding or unwatering was to have capacity of 5,715,000 cubic feet, and be provided with four 54-inch vertical centrifugal pumps with a capacity of 75,000 gallons per minute, pumping against a head up to 42 feet. These pumps are directly connected to 750-horsepower motors, which operate at 250 revolutions per minute.

BALBOA DRY DOCK. Among the large dry docks under construction during the year was the Balboa Dry Dock at the Pacific terminal of the Canal Zone. The dimensions of this dock were:

Length over-all	1110.0
Maximum length of ship dockable	1000.0
Width of entrance, clear	110.0
Width of body of dock at coping	140.0
Width of body of dock at floor	117.0
Depth, coping to floor	56.0
Height of keel blocks	4.5
Depth of water over tops of blocks mean sea level	35.0
Mean high water	41.5
Mean low water	29.3

During the year the Pearl Harbor Dock at Hawaii, in which difficulties of construction were

encountered which required its rebuilding, was planned by the United States government for a length of 1029 feet in place of the 831 feet of the original structure whose foundations failed during construction.

The third annual meeting of the National Association of Port Authorities was held at Baltimore, December 8, 9, and 10, at which a number of papers dealing with such subjects as Federal, State, and local control over ports and water fronts were presented. Col. William M. Black, U. S. A., of the Corps of Engineers, interested in the New York harbor improvement, and D. F. Cresson, Jr., Chief Engineer of the New Jersey Harbor Commission, were among those who presented papers.

CANADIAN DOCKS. Late in the year the Dominion government of Canada, through the Department of Public Works, was preparing plans for the construction of a dry dock 180 by 1150 feet at Halifax, Nova Scotia, at an estimated cost of \$3,000,000. Somewhat earlier the Amalgamated Engineering Company secured a subsidy from the Canadian government for the construction of a dry dock at North Vancouver, British Columbia. This structure was to be 100 by 1150 feet, but divided into two compartments of 500 and 650 feet respectively; the estimated cost was \$8,500,000. Early in 1914 the city of Toronto began work on a \$25,000,000 harbor development plan, which includes the construction of a large sea wall and breakwater; a park and boulevard within the borders of the lagoon so formed; a large industrial district formed by filling in shallow water, giving some 646 acres for factory sites; and a new set of docks to replace the existing piers, which alone were estimated to add from \$5,000,000 to \$6,000,000. The dock development, however, was not to be undertaken at once.

BRITISH DOCKS. The new joint dock at Hull, England, built by the North-Eastern and Hull and Barnsley Railway Companies, was opened by King George in June after having been under construction since 1909. The water area of this dock was 85 acres, and it has a length of 8162 feet of quay, with a lock 750 feet long by 83 feet wide, and a depth of water over the sill at high water of 41½ feet. There are also two graving docks, the largest being 550 feet in length.

On the west coast of England in July the new entrance lock of the South dock extension at Newport was opened. This dock covers 96 acres and is 4000 feet long by 1000 feet wide. The lock is 1000 feet wide and is provided with three sets of gates of 1000 feet, 800 feet, and 400 feet alternatively. The depth of water over the sill is 45 feet at spring tide and 20 feet at neap tide. The channel 2 miles long, having a bottom width of 850 feet, was dredged from the mouth of the Eske to the lock. The pumping plant has a capacity of 10,000,000 gallons of water per hour. In Scotland, at Rosyth, progress was being made on the great naval base, the contracts under way including the construction of a main deep water basin covering 55 acres, with an entrance channel from the fairway, and three graving docks, 750 feet long and 110 feet wide. These works require the reclamation of 3000 acres of land from the sea. During the year some 3000 men were employed on the work and its extension will doubtless require extra assistance. In London the construc-

tion of the new Albert Dock was vigorously undertaken. The contract for the gates, lock, bridges, and other appliances had been placed in the hands of a German firm whose price was the lowest at the time bids were invited, but it was cancelled and the work given to English contractors.

During the year the port improvements of Buenos Aires suffered a serious blow in the bursting of the dock dam, and a complete inundation of the works. The damage was estimated at \$1,000,000. Costa Rica, subject to the approval of Congress, signed a contract for the development of Port Tortuguero during the year.

DODGE, GRACE HOADLEY. An American educator and philanthropist, died Dec. 27, 1914. She was born in New York in 1856, the daughter of William Earl and Sarah (Hoadley) Dodge. For more than thirty years she was interested in charitable and educational work in her native city. She was the first woman to be appointed to the Board of Education, and after taking an active part in the founding of Teachers College, which later became part of Columbia University, she was chosen treasurer of the college. From its organization she was president of the National Board of the Young Women's Christian Association. Besides many other gifts, seldom made public, in 1912-13 she gave \$375,000 to the \$4,000,000 campaign fund of the Y. W. C. A.-Y. M. C. A. in New York, a large part of this amount being devoted to the National Board building of the Y. W. C. A. She organized the Working Girls' Society and the Travelers' Aid Society, whose trained women are in railroad stations and at steamship piers throughout the country. She was also president of the board of trustees of the American College for Girls at Constantinople. Her will made provision for the following large gifts: to Teachers College, \$500,000; to the National Board of the Y. W. C. A., \$500,000; to the Y. W. C. A. of New York, \$200,000; to the American College for Girls at Constantinople, \$50,000; to the Presbyterian Board of Home Missions and the Board of Foreign Missions, the Travelers' Aid Society, and the New York Y. M. C. A., each \$25,000. Besides editing *Thoughts of Busy Girls* (1892), she was co-author of *What Women Can Earn* (1899), and wrote *A Bundle of Letters to Busy Girls on Practical Matters* (1897), which appeared in several languages.

DOLAN, THOMAS. An American financier, died June 12, 1914. He was born in Montgomery Co., Pa., in 1834. His father died when he was still a small child, and for several years the boy supported his widowed mother, acting as clerk in a retail dry goods store. At the age of 27 he started his own textile factory and ten years later turned to the manufacture of worsteds and cassimeres. From that time on he was recognized as one of the leading manufacturers of Philadelphia. As other enterprises began to demand much of his time he retired from manufacturing in 1897, and shortly after he became associated with William L. Elkins and P. A. B. Widener in acquiring and constructing street railways in Philadelphia. After various manipulations they brought about a combination of all the street railways in the city. These financiers then turned their attention to street railways in New York City, and by 1893

they controlled practically every piece of rolling stock in that city. With them were associated Thomas F. Ryan and William C. Whitney. The profits from these enterprises were enormous. In 1892 Mr. Dolan became president of the United Gas Improvement Company of Philadelphia, and under his management this became the greatest company of its class in the world. Mr. Dolan's fortune at the time of his death was estimated at between \$20,000,000 and \$35,000,000.

DOMESTIC RELATIONS COURT. See section so entitled under MARRIAGE AND DIVORCE.

DOMINICA. A West Indian island; a presidency of the Leeward Islands (q.v.). The island is mountainous and plentifully watered. The soil is fertile, but coffee and sugar cultivation has declined. Cacao, limes, spices, oils, and timber are exported. In 1912 the export of cacao was 11,877 cwt.; the export of limes and limejuice was valued at £79,848, citrate of lime £11,991, essential oils £5303, fruit and vegetables £3942. Total imports, 1912, £159,529 (£164,695 in 1911); exports, £152,458 (£124,678). Revenue, 1912-13, £45,300 (£44,054 in 1911-12); expenditure £40,304 (£38,792). Total tonnage entered and cleared, 1912-13, 578,892, of which 486,564 tons British. Public debt Dec. 31, 1912, £45,195. Customs revenue, 1912-13, £24,295. Roseau, the capital, has 6577 inhabitants. Administrator, 1914, W. Douglas Young. See **LEEWARD ISLANDS**.

DOMINICAN REPUBLIC, or SANTO DOMINGO. An independent State occupying the larger and eastern part of the island of Haiti. The capital is Santo Domingo.

AREA, POPULATION, ETC. The republic is composed of 12 provinces, with a total estimated area of 48,577 square kilometers (18,756 square miles). The population (1913) is stated at 724,500. Estimated population of the larger towns: Santo Domingo, 22,000; Santiago, 20,000; Puerto Plata (the chief port) and San Pedro de Macoris, 15,000 to 16,000 each; La Vega, 10,000; Samaná, Sánchez, Monte Cristi, and Azua, 4000 to 5000 each. Reported marriages (1911), 2442; births, 27,407; deaths, 6603. Primary instruction is free and nominally compulsory. In 1911 there were 590 schools, with 20,453 pupils (10,422 boys and 10,031 girls). The State religion is Roman Catholicism.

PRODUCTION, COMMERCE, ETC. Of the total area, about 15,500 square miles, or nearly one-third of the country, is stated to be cultivable. Agriculture and cattle raising are virtually the only source of national wealth, as mining and manufacturing are little developed. The chief commercial crops are sugar and cacao; other important products are tobacco, coffee, cotton, and bananas and other fruits.

Imports and exports have been valued as follows, in thousands of American dollars:

	1909	1910	1911	1912	1913
Imports	4,426	6,258	6,950	8,218	9,273
Exports	8,114	10,850	10,996	12,385	10,470

Leading imports in 1913: cotton goods, 1880 thousand dollars; iron and steel manufactures, 1346; provisions, 2807; bags, sacks, etc., 281; chemicals and drugs, 213; leather and manufactures thereof, 276; agricultural implements, 143. By far the most important exports are sugar and cacao. The development of the lat-

ter in recent years is especially noteworthy. Sugar and cacao in 1909 were exported to the value of \$3,304,931 and \$2,759,191 respectively; in 1910, \$5,590,536 and \$2,849,585; in 1911, \$4,159,733 and \$3,902,111; in 1912, \$5,841,357 and \$4,248,724; in 1913, \$3,120,000 and \$4,651,000. For 1912 and 1913 respectively, other exports are reported as follows, in thousands of dollars: leaf tobacco, 670 and 1122; bananas, 112 and 290; coffee, 566 and 257; hides and skins, 235 and 241; woods, 126 and 167; beeswax, 149 and 118. Trade by countries, in thousands of dollars:

	Imports		Exports	
	1912	1913	1912	1913
United States	5,100	5,769	7,275	5,601
Germany	1,628	1,673	1,774	2,068
United Kingdom	720	780	1,248	242
France	225	274	938	858
Others	545	820	1,160	1,671
Total	8,218	9,271	12,385	10,470

In 1912, vessels entered at the ports in the foreign trade numbered 599, of 407,748 tons; cleared, 477, of 379,147 tons.

Railway in operation, 282 kilometers (175 miles). In addition there are private lines for sugar plantations reported at 362 kilometers (225 miles). The completion of a few kilometers of line from Salcedo to Moca will effect rail communication between Puerto Plata, on the north coast, and the eastern port Sánchez, on the Bay of Samaná. There are reported 16 telegraph offices, with 352 miles of line; telephone line, 719 miles; post offices, 105.

FINANCE. For the fiscal year 1912-13, revenue and expenditure are reported at \$5,809,785 and \$5,845,994 respectively; for 1913-14, \$5,035,250 and \$4,890,216. By far the greater part of the revenue is derived from customs. A treaty between the Dominican Republic and the United States authorized a loan of \$20,000,000 for the conversion of the debt, and established an American receivership of customs, from April 1, 1905.

GOVERNMENT. The executive authority is vested in a President, who, according to the constitution, is elected by indirect vote for six years. The legislative power devolves upon a Congress of two houses, the Senate (12 members, elected for six years) and the Chamber of Deputies (24 members, elected for four years). In 1913 José Bordas Valdés was elected Provisional President, assuming office April 14.

HISTORY. The fear that the government of Provisional President José Bordas Valdés would prove no more stable than its predecessors was confirmed early in 1914 by frequent manifestations of unrest and discontent. Although the Senate rejected the impeachment charges which had been preferred against the President, many politicians outside of Congress held to the conviction that the President had used his power to misappropriate the public revenues and to override the legislative and judicial organs of government. The anti-presidential party was still further antagonized when the government postponed the elections, which should have taken place on April 1-2. In May a presidential decree was issued fixing June 7 as the date for the election; the Presidential Electors were to meet on June 15 to choose the President, who would take the oath of office on July 1. But a revolution had already broken out in the northern province of Santiago.

General Arias, the rebellious Governor of the province, was removed from office and outlawed. A rebel force under Gen. Mauricio Jimenes at La Vega surrendered in April to the Federal commander, Tancredo Savinon, and another band of insurgents at Santiago was forced to capitulate; but the rebellion was more successful at Puerto Plata, on the northern coast of the island, where the rebel forces were able to hold President Bordas Valdés's troops at bay. The severe fighting at Puerto Plata—that is, severe fighting for Santo Domingo—awakened such lively apprehensions in Washington that on May 1 the U. S. gunboat *Petrel* was ordered to Dominican waters, and a few days later the U. S. cruiser *Washington* joined the *Petrel*. On May 12 Captain Eberle of the *Washington* held a conference on board his ship in an unsuccessful endeavor to bring the insurgents and the government to an amicable agreement.

In the third week of May fresh life was infused into the insurrection by the arrival of a large consignment of arms and ammunition, which had been smuggled across the Haitian frontier. La Vega was recaptured for the revolution. Meanwhile the government forces were laying close siege to Puerto Plata, and the Dominican "navy" was blockading Monti Christi, the other northern seaport held by the rebels. In June a German cruiser, the *Strassburg*, was ordered to Puerto Plata for the protection of German interests. Several times Captain Eberle of the *Washington* had warned President Bordas Valdés not to direct his artillery fire at the town, inasmuch as the foreign residents of Puerto Plata might receive injury. On June 26, after an Englishwoman had been killed by a stray shot in the Puerto Plata fighting, the U. S. gunboat *Machias* steamed into the inner harbor, and with a few well-directed shots silenced one of President Bordas Valdés's batteries. The *Machias* came into action a second time early in July, replying to a few rebel shots which had chanced to hit the ship.

In August, during an armistice, which had been arranged by Captain Eberle, the United States government sent a regiment of U. S. marines and a mediatory commission—including Ex-Governor J. F. Fort of New Jersey; the United States Minister to Santo Domingo, James M. Sullivan; and the New Hampshire lawyer, Charles Smith—to make peace in the Dominican Republic. The diplomatic representations of the commissioners, and the presence of the marines, induced the warring factions to accept an agreement, which provided for the establishment of a provisional government and the institution of elections under the "observation" of watchers appointed by the United States. President Bordas Valdés resigned on August 27, and Congress elected Dr. Ramón Báez as the new Provisional President. Dr. Báez selected the following Cabinet officers: Interior, Sr. Enrique Jiménez; finance, Dr. Salvador Gautier; war, P. A. Lluberes; public works, Osvaldo Báez; justice, J. B. Peynado; foreign affairs, Ignacio M. González; agriculture, Pedro M. Mejía. The elections held under the "observation" of the United States resulted in a victory for Sr. Jiménez, but were so closely contested that party feeling continued to run high; and on November 24 the United States transport *Hancock* was ordered to Santo Domingo with 800 marines, news having been received of fresh revolutionary disturbances. See

also INTERNATIONAL ARBITRATION AND PEACE, *Bryan-Wilson Treaties*.

DOUBINE. See VETERINARY MEDICINE.

DRAINAGE. UNITED STATES. Activity in the reclamation of swamp and other wet lands during 1914 has been more apparent in progress along lines already tried than in new kinds of undertakings. Legislative acts and judicial rulings in some States have placed drainage organizations upon a more secure basis, and in others there is agitation for revision of the drainage laws. The Virginia law has been revised considerably; the Supreme Court of Idaho has declared the drainage law of 1913 to be valid, overruling a lower court; a lower court has upheld the validity of New Mexico's drainage statute. However, the Black and Boggy Swamps Drainage District in South Carolina was dissolved by the County Court because the assessment exceeded the constitutional limit of taxation of the State. An appeal was not taken, although there is precedent in North Carolina and other States for holding that assessments for local benefits are not subject to the legal limits of taxation. The bill introduced in Congress by Senator Newlands, permitting the Federal government to take charge of interstate and other drainage projects, even loaning the necessary money to the districts, has not yet received the consideration of Congress.

Among the Eastern and Southern States, North Carolina easily leads in the number of drainage districts formed; an increasing portion of the work is the enlargement of creek channels in the rolling Piedmont section. The State is coöperating with the U. S. Department of Agriculture in the encouragement of tile drainage, and of terracing to prevent erosion on cultivated hillsides. A special engineering commission has prepared plans for the main drains recommended as necessary and sufficient for draining the Everglades of Florida. In the upper Mississippi Valley, drainage of farm lands and of marsh lands continues rapidly, by individuals and by community projects organized under laws that have been in force for a number of years. In Desha Co., Ark., the second of the large ditches for diverting Cypress Creek (draining a large area) into the Red River, is well under construction. In Lafayette Co., Ark., surveys have been made of two large districts, and plans have been prepared for draining them and protecting against overflow from the Red River. A surprising interest in farm drainage was aroused in Kentucky during the year, and a number of tile systems were laid where this kind of improvement was previously unknown. In those States where cotton is the main crop, the effect of the European War in curtailing the cotton market has retarded drainage progress. Investigations have been started looking to the protection and drainage of 40,000 acres of overflowed land along the Kootenay River from Bonners Ferry, Idaho, to the Canadian line.

The area of irrigated lands injured by seepage and alkali continues to increase. One of the most difficult problems has been encountered in the vicinity of Grand Junction, Colo. The U. S. Department of Agriculture has been conducting investigations there for a number of years, and the results of recent experiments indicate that deep drains supplemented with deep relief wells will permit the reclamation of even the worst places at costs not low but, nevertheless, profit-

able. The Carmel Drainage District, in the San Luis Valley, Colo., has completed construction work. The United States Reclamation Service is considering the construction of a big outlet drain for the San Luis Valley, to develop water for irrigation farther down the Rio Grande. Plans have been made for a drainage district of several thousand acres near Sterling, Colo. A number of drainage districts have been organized in the Yakima Valley, Wash., in Utah, and New Mexico.

FOREIGN COUNTRIES. The government of British Columbia has passed an act authorizing the Lieutenant-Governor, upon petition from owners desiring to drain, dike, or irrigate their lands, to appoint three commissioners to execute and maintain the improvement works. Under this act has been authorized the drainage of a large overflowed area in the Lillooet River Valley, by lowering Lake Lillooet. The government of British Columbia has made quite detailed studies of the probable works necessary to protect and drain the overflowed lands along the Kootenay River from the International Boundary to Kootenay Lake, just below the proposed district in Idaho.

The Russian government is endeavoring to develop parts of the Caucasus by drainage, flood prevention, and irrigation. Considerable progress had been made by the middle of the year, mostly in Eastern Transcaucasia on the lower parts of the Rivers Arx and Kur. Surveys have been undertaken to plan the drainage of the Mugan swamps for about 80 miles along the New Aras, between Lake Ak-Tchal and the Tcheilak post. The Austrian government and the Provincial Commission of Vorarlberg have arranged for constructing protective works necessitated by the floods of 1910 and 1912. Temporary works have been placed where the need is most urgent, and \$800,000 was appropriated for regulating the Ill River.

In Egypt, on the projects begun in 1912 in the Beherah and Gharbieh districts, excavating has been finished, and most of the bridges and sluices have been placed. The government has awarded a contract for the pumping machinery, costing \$900,000, to be erected at Baltim, near Cairo. There will be eight Diesel crude-oil engines, and six steam engines, totaling 6050 horsepower, direct-connected to centrifugal pumps having a capacity for lifting 2,000,000,000 gallons of water in 24 hours against a head of 7 to 13 feet.

India, like the Western United States, finds some irrigated lands become waterlogged and need drainage. Near Amritsar, land under the Bari Doab Canal has been so affected, and works are being constructed to utilize fall in the canal for generating power to pump water from the soil and use it for irrigation. So far as this is successful it will serve the double purpose of draining the wet land, and conserving irrigation water in the canal. For protecting and draining 17,000 square miles of overflowed lands in the Hwai River district of China, \$20,000,000 was to be made available by a Chinese government gold loan, secured by all the revenues from the benefited lands. There would be a special conservancy tax on those lands, as well as tolls from the canals. The war in Europe will probably prevent the floating of this loan. In Chosen (Korea), investigations have been started toward leveeing and generally improving several of the large rivers, as the next public work to be undertaken by the government.

The Premier of the Commonwealth of Australia has submitted to the government a bill including \$1,000,000 for drainage and other public works.

DRAMA, AMERICAN AND ENGLISH. The theatre season of 1914, in both America and England, was sharply divided into two sections by the outbreak of the war. The first half, though far from brilliant, was fairly normal; but the second half was a period of unprecedented depression. In times of great financial stress, people economize first of all by cutting off their theatre-going. The war practically put a stop to theatrical production in England, and, though the United States was a neutral nation, the patronage of the American theatres was diminished fully fifty per cent. In New York, many of the first-class houses were dark for several weeks at the height of the season. Plays which ordinarily would have run a year were summarily withdrawn. Conditions on the road were even worse; and the most successful metropolitan productions of the preceding season played to less than half the business that was expected of them in the subsidiary cities. In December the Liebler Company collapsed. George C. Tyler, the director of this firm, was honored in both America and England as a manager of fine artistic taste and high ideals; and his enforced retirement was regarded as a great loss to the theatre. A few days later, another manager to whom the public had been indebted for many excellent productions, Harrison Grey Fiske, was driven into bankruptcy.

Under such conditions, it was impossible for a playwright to achieve a mild success. Any play produced after the outbreak of the war had to make an immediate and great impression; otherwise there was no alternative but failure. A good enough play was no longer good enough: something striking and sensational and, if possible, unique had to be invented to catch the public eye and set the people talking. This necessity called forth, in America, a series of plays in which a strong effort was made to capture immediate attention by subverting one or another of the traditional conventions of the drama. From the technical standpoint, the quest for novelty must be recorded as the definitive feature of the year. Some of the new devices invented showed no merit but their unconventionality; but others proved themselves so valuable that they seemed destined to be adopted as permanent additions to the technique of the theatre.

The most successful, and also the most interesting, American play of the year was *On Trial*, by Elmer L. Reizenstein, a new author only twenty-one years old. The story of this melodrama was conventional enough: a husband murdered a man who had seduced his wife many years before, and who recently had reappeared to torture and torment her; but the author imparted a new interest to this old material by telling the story backward. Instead of proceeding from causes to effects, he proceeded from effects to causes; instead of building his plot up, he broke it down. In an interesting melodrama entitled *Under Cover*, which ran in Boston throughout the first half of the year, and simultaneously in New York and Chicago throughout the second half, Roi Cooper Megrue successfully overturned the tradition that a dramatist must never keep a secret from the audience. The play dealt, in a serio-comic mood, with smuggling

through the New York customhouse. Until the very end of the last act, the hero was presumed to be a smuggler; then it was suddenly revealed that he was an agent of the secret service whose purpose was to convict the customhouse officials of grafting. A successful farce entitled *It Pays to Advertise*, which was written by the same author in collaboration with Walter Hackett, was made amusing by a continual series of surprises. Time and again, the audience was forced to change its mind about the motives of the characters. An even greater alertness on the part of the audience was demanded by an unusual play, by A. L. Thomas and Clayton Hamilton, which ran for several weeks in Boston under the title of *Wanted: \$22,000*, and was subsequently presented in New York under the title of *The Big Idea*. The hero was a young author who found himself in immediate need of a large sum of money to save his family from disgrace and ruin; the heroine persuaded him to write his own circumstances into a play; and, in the last act, the two sold the piece to a theatrical manager for the needed amount of money. Thus, at the same time, the audience saw the hero writing a play, and saw the play that he was writing. In *Innocent*, which was adapted by George Broadhurst from the Hungarian of Arpad Pasztor, the hero killed himself in the prologue, and the play itself, which was set two years before, outlined the circumstances which had culminated in the suicide. The note of novelty was also apparent in another Hungarian play, by Ferenc Molnar, adapted into English by Leo Ditrichstein, and called *The Phantom Rival*. The entire second act depicted a dream of the heroine's in which an old lover appeared to her in various imagined aspects, and talked romantic nonsense. Then, in the last act, the man came back to her in fact, and showed himself less worthy than her dreams of him. Another dream-play, which was presented in England before the outbreak of the war and in America afterward, was *My Lady's Dress*, by Edward Knoblauch. The heroine, having just received a new dress from Bond Street, fell asleep and dreamed her way through a series of seven one-act plays, depicting crucial moments in the lives of various people who, at one time or another, had toiled to manufacture the materials that went into the making of her gown. This play was beautifully produced by Frank Vernon, with a return to the technique of the inner-and-outer stage of the Restoration period. *Too Many Cooks*, by Frank Craven, was also notable for novelty of stage-direction. The hero, who was engaged to be married, was building a house in the suburbs. All three acts were set in the same place; but the first set exhibited the foundations of the house, the second set showed the erection of the framework, and the third set revealed the completed edifice. The influence of the moving-picture play was apparent in *The Battle Cry*, a dramatization of a novel by Charles Neville Buck. Some of the scenes were acted on the stage; and intervening episodes were depicted on a screen by the kinetoscope. A somewhat similar technique was employed in *The Silent Voice*, by Jules Eckert Goodman. The hero was a deaf man, accustomed to lip-reading, who, gazing through field-glasses from the house-top of his mansion on Fifth Avenue, could read the lips of people talking in the park across the way. The incidents which he was

supposed to be observing through his glasses were simultaneously revealed upon the stage behind an illuminated transparency. A similar device was invented by Marie Dressler for her production of *A Mix-up*, an otherwise inconsiderable farce by Parker A. Hord. Whenever a character was called up on the telephone, the backdrop became translucent and revealed in pantomime the person speaking at the other end of the wire.

The plays enumerated in the foregoing paragraph were all remarkable for some sort of technical innovation. Some of them were good, and some of them were bad; but, taken together, they represent the eager and somewhat desperate quest of novelty that must be regarded as the definitive feature of the theatre season of 1914, in America and England.

Among the more serious American plays of the year, the following should be recorded. *The Miracle Man*, by George M. Cohan, was dramatized from a novel of the same name by Frank L. Packard. A gang of crooks who had schemed to make money by exploiting the ministrations of an elderly faith-healer in a little town in Maine were converted, against their inclinations, to a better way of life by the sweetness and light that radiated from the patriarch they had intended to victimize. *The Money Makers*, by Charles Klein, exhibited a struggle between a repentant capitalist, who desired to give back his millions to the people he had robbed, and the members of his family, who tried to have him legally declared insane in order to prevent him from giving away his tainted money. A play entitled *The Deadlock*, by Margaret Turnbull, dealing with the Roman Catholic doctrine of marriage, failed during the course of the season because it was based upon religious beliefs with which the theatre-going public was not in sympathy. Another religious play, entitled *Polygamy*, by Harvey O'Higgins and Harriet Ford, attacking the conditions of life in Utah at the present time, had a fair success. *Young Wisdom*, by Rachel Crothers, was a charming and delightful comedy that dealt with the danger of advanced ideas to minds too immature to be able to digest them. Edward Sheldon was represented by two plays during the course of the autumn season, one of them romantic and the other realistic; but both were disappointing to admirers of his talents. *The Garden of Paradise* was a tedious dramatization of *The Little Mermaid* of Hans Christian Andersen; and *The Song of Songs* was a vulgar and chaotic dramatization of *Das Hohe Lied* of Hermann Sudermann.

Attention may now be turned to the lighter American pieces of the year. *A Pair of Sixes*, by Edward Peple, had something of the snap and go of a typical George M. Cohan farce. Two partners, who had always disagreed, decided to settle their differences by dealing a single hand of poker: the winner was to conduct the business for a year, and the loser, meanwhile, was to wait upon his partner as a domestic servant. One partner won the deal with a pair of sixes; but the loser lorded it over his antagonist by creating chaos in the household in which he served as butler. *Twin Beds*, by Salisbury Field and Margaret Mayo, retold the old story of a man who blundered into the wrong apartment and compromised a wife by sleeping innocently in her husband's bed; but this material was

handled with unexceptionable delicacy and unusual wit. *The Rule of Three*, by Guy Bolton, satirized the absurdity that arises from the differences between the divorce laws of the various States. *Daddy Long-Legs*, by Jean Webster, which told again the old, old story of a rich and charitable man who fell in love with a little orphan waif, was rendered worth seeing by the stage-direction of Henry Miller and the acting of Ruth Chatterton. *Kitty MacKay*, a worthless play by Catherine Chiselm Cushing, achieved a popular success because it retold the tale of *Cinderella* in terms derived from *Bunty Pulls the Strings*.

La Tosca of Sardou, in various disguises, proved itself once more to be the abiding melodrama of the year. The essential scene of *La Tosca* was repeated in *The Yellow Ticket*, by Michael Morton, in *Panthea*, by Monckton Hoffe, and in *Mr. Wu*, by Harry M. Vernon and Harold Owen. The first piece was set in Russia, the second in Germany, and the third in China; but the motives leading to the climax remained, in every case, the same. The best American melodrama of the year was *Kick In*, by a new author, Willard Mack. It dealt with the difficulties experienced by an ex-convict in endeavoring to re-establish himself in legitimate society. Scarcely less interesting was *The Dummy*, by Harvey O'Higgins and Harriet Ford, a serio-comic melodrama that narrated the adventures of a boy detective. *The Law of the Land*, by George Broadhurst, was an interesting melodrama of the type that hovers within hailing distance of actuality. *Life*, by Thompson Buchanan, was an American imitation of the flagrant type of melodrama made popular at Drury Lane by Cecil Raleigh, who died during the year. It achieved popularity by assembling the greatest possible number of theatrical effects that had proved themselves popular in the melodramas of the past. The same note of extreme conventionality accounts for the success of *Experience*, by George V. Hobart, a modern morality play that was utterly commonplace and unilluminated.

An immediate result of the outbreak of the war was the transference to America of the activities of many English actors, and several English playwrights. Henry Arthur Jones, for instance, delivered three productions in America during the second half of the season. *Mary Goes First* was imported by Marie Tempest as the leading feature of a repertory that included, among other items, a revival of *The Marriage of Kitty*; *The Goal* was admirably acted, at the Princess Theatre, by Holbrook Blinn; and a new play, called *The Lie*, was presented by Margaret Illington. *The Lie*, though an artificial fabric, was constructed with extraordinary skill; and it deserves to be recorded as the most effective drama composed by Henry Arthur Jones in recent seasons. Early in the year, *The Legend of Leonora*, by Sir James Barrie, was presented in America. This is the same play that had previously been produced in London under the title of *The Adored One*. It was chaotic in structure, and somewhat bewildering in caprice; and it was rendered void by the inefficient acting of Maude Adams. *Pygmalion*, by George Bernard Shaw, after having been produced in Germany and in England, was imported to America with that great actress, Mrs. Patrick Campbell, in the leading part. It was received as a diverting series of intelligent and witty dialogues; but it failed

to win consideration as a great example of dramatic art. *Outcast*, by Hubert Henry Davies, the most serious composition of this delicate and dainty artist, was made illustrious by the admirable acting of Elsie Ferguson. *Consequences*, the first work of a 22-year-old dramatist named H. F. Rubinstein, after having been produced by Miss Horniman in Manchester, was successfully presented in London, in New York, and in Chicago. It was a clever satire of the idealism of youth, written brilliantly in emulation of Bernard Shaw. A more conventional satire of the foibles of the British aristocracy, entitled *A Pair of Silk Stockings*, by Cyril Harcourt, was played both in England and in America, and served as a setting for the perfect character-acting of Kenneth Douglas. *Change*, by J. O. Francis, was the play that won the prize offered by Lord Howard de Walden for the best dramatic composition by a Welshman dealing with the life of Wales. The theme of the piece, that crabbéd age and youth cannot live together, was traditional; but the characters were rendered with uncanny truthfulness, and the dialogue suggested at every moment the accent of actuality. But the most popular play of the year, derived from British authorship, was *Grumpy*, by Horace Hodges and T. Wigney Percival. This was merely a conventional melodrama, in the manner of Scribe or the earlier Sardou—a sort of *Scrap of Paper* brought expediently up to date—but it was rendered successful in both America and England by the exquisite character-acting of Cyril Maude.

Lou-Tellegen, who formerly had acted in French with Sarah Bernhardt, made his début as an English-speaking actor in *Maria Rosa*, translated from the Catalan of Angel Guimera, through the Spanish of José Echegaray, by Wallace Gillpatrick and Guido Marburg. This literal representation of the conditions of life among the primordial peasants of Catalonia seemed strange, and new, and powerful. Late in the year, the same gifted actor appeared in a mechanical melodrama by Kate Jordan, entitled *Secret Strings*. The most effective French play that was imported to America during the year was *The Hawk*, by Francis de Croisset. It was well acted by William Faversham, and by Gabrielle Doiziat, who repeated in English the performance that she had given in French in Paris; but the play itself was merely a skillful piece of mechanism, and exhibited little reference to life. *The Beautiful Adventure* was a rather charming sentimental comedy translated from the French of Robert de Flers and Armand de Caillavet. *The Prodigal Husband*, on the other hand, was an incoherent, and consequently ineffective, play by Dario Niccodemi. A genre-study by the Belgian authors, Frantz Fonson and Fernand Wicheler, was skillfully localized in Maine by the American novelist, Holman Day. It was called *Along Came Ruth*; and it depicted, with pleasant and ingratiating humor, the resurrection of a sleepy little rural town by an enterprising girl.

Among the scenic productions of the year, the most notable, perhaps, was the investiture contributed by Joseph Urban to *The Garden of Paradise*, a romantic play by Edward Sheldon that has been already noted. Urban's mastery of color and of lighting was also exhibited in the production of *Twelfth Night*, with Phyllis Neilson-Terry in the leading rôle. Less sumptuous, but more subtle and suggestive, were the

settings designed by Livingston Platt for the Shakespearian repertory of Margaret Anglin. The production of *A Thousand Years Ago*, by Percy Mackaye, which was staged by J. C. Hoffman in imitation of the manner of Max Reinhardt, was somewhat blatantly inartistic in details, but exhibited a laudable endeavor to reveal to the American public the artistic intention of the newest European methods of production. On the other hand, the panoramic investiture of Richard Walton Tully's play, entitled *Omar, the Tent-Maker*, that was made by Wilfred Buckland, exhibited only a repetition of David Belasco's method of literal transcription from actuality. A dramatic version of *David Copperfield*, by Louis N. Parker, entitled *The Highway of Life*, was exhibited, late in the year, with meticulous attention to the scenery and costumes; but this production failed to interest the public, because the play itself was tedious.

Shakespearian productions were made, during the course of the year, by Sir Johnstone Forbes-Robertson, William Faversham, Margaret Anglin, and Phyllis Neilson-Terry. The most commendable of these were Miss Anglin's presentations of *The Taming of the Shrew*, *As You Like It*, *Twelfth Night*, and *Antony and Cleopatra*, which were marked by a rare zest and *esprit de corps* on the part of every member of the company.

Among the new theatres opened in New York during the course of the year, the most notable were the Punch and Judy, erected by Charles Hopkins, and the Bandbox, inaugurated by Douglas J. Wood. The Punch and Judy Theatre, a little gem of architecture, was opened with an ineffective comedy by Harold Chapin, entitled *The Marriage of Columbine*; and the coöperative company of actors at the Bandbox made their first appearance in a poor performance of *La Mousière* of Jules Lemaitre, translated by Jerome K. Jerome and reëntitled *Poor Little Thing*. The Princess Theatre continued its policy of presenting a composite bill of one-act plays; and one of these, *Across the Border*, by Beulah Marie Dix, which exhibited in poignant terms the moral obliquity of war, provided one of the few undeniable sensations that may be recorded to the credit of the poorest theatre season that New York has known for many years.

PHOTOPLAYS. When moving pictures were first developed into something more than a means of filling in between vaudeville acts, the subjects, though treated with a sequence of action as in the ordinary drama, were such as would appeal to the five and ten cent audiences, supposedly interested in railway wrecks, street fights, highway robberies, daring rescues, etc. The dramatic possibilities involved in the development of this form of entertainment, however, and the great inroads such presentations made on the attendance at the legitimate theatres early forced the managers to secure spoken plays that had already been successful as subjects for the "movies," as well as to have constructed by eminent authors or dramatists a number of others written with the distinct purpose of film representation. While the majority of photoplays, as seen in 1914, exhibited the choice of more serious subjects, and while those of real dramatic quality engaged public attention, yet it was difficult to understand why depicting scenes on the film was more attractive to many audiences than the presentation of them in

spoken language. If it was the appeal of realism that causes the film-play to hold its popularity, it would seem that colored moving pictures would be more in vogue, but on the contrary, most experienced managers have abandoned these, where they have tried them. The best representatives of this sort of work were the "Kinemacolor" pictures, and while these were used for a limited number of subjects, they counted for little in the great mass of films shown daily. It must be remembered after all that though a ten-reel film may show a large number of scenes, obvious situations are the only ones that really can convey any message, and it was a growing opinion that, as the public grows more critical, the film drama had to comprise frank and striking appeals, depicting, for example, stories of war, adventure, exploration, acts of daring, etc., leaving the spoken play to occupy its natural sphere of the presentation of action with the assistance and amplification that can only be secured by the spoken word.

Neither pains nor expense were spared to secure not only the best technical work in the photography and setting of photoplays, but the best stage talent was gradually enlisted, with, in many cases, conspicuous success. It must be noted in passing, however, that not every successful actor is equally successful before the camera, and instances might be mentioned where an attempt to transfer the leading "success" to the films has resulted in unsatisfactory effects, due often to the failure of the actors to realize photoplay conditions. A great variety of plays, however, were photographed and presented with varying degrees of success.

In order to make the subject of the photoplay as well as the cast of characters familiar to an "audience," it is usual, after announcing the subject of the play, to throw on the screen the cast of characters, and follow this by a series of pictures representing each actor and actress in some characteristic pose, and give a short résumé of the events to follow. In many cases special incidental music was composed, adapted to the subject of the play, which assisted to a marked degree in the effect produced. It would be impossible in a limited space to recount the important plays that have been shown as photo dramas during the last two years, but the following, which had a special vogue in 1914, may be mentioned:

Quo Vadis; *Last Days of Pompeii*; *Soldiers of Fortune*; *Seas of the Mighty*; *Tess of the D'Urbervilles*, with Mrs. Fisk; *The Lion and the Mouse*; *Paid in Full*; and *Third Degree*; Madame Bernhardt in *Camille*, and in *Queen Elizabeth*; *Arizona*; *Prisoner of Zenda*; *Clothes*; and quite recently, *Cabiria*, of which the scenario was specially written by Gabrielle d'Annunzio; *Les Misérables*; and *The Rose of the Rancho*. These all required great expense in assembling the companies, transporting them to the various localities where the scenes were laid, or to corresponding surroundings, and an immense amount of rehearsal and incidental supervision, to bring them up to the standard necessary for exhibition to a public having an increasingly critical disposition.

DRAMA IN EUROPE. See FRENCH, GERMAN, ITALIAN, and SCANDINAVIAN LITERATURE.

DRAPER, EBEN SUMNER. An American manufacturer and public official, died April 9, 1914. He was born in Hopedale, Mass., in

1858, and was educated at a private school and at the Massachusetts Institute of Technology. He carried on his studies while working in machine shops and cotton mills. In 1880 he was admitted to the firm of George Draper and Sons, and when 16 years later the Draper Company was founded, he became its selling agent. In 1892 he served as chairman of the Republican State Convention, and in 1896 headed the Massachusetts delegation to the Republican National Convention, at which he assisted in securing the "gold standard" resolution. He was a presidential elector in 1900. In 1906, 1907, and 1908 he served as Lieutenant-Governor of Massachusetts, and was elected Governor for two terms, 1909-10, and 1910-11. He was a director and officer of many important financial institutions and was a member of several patriotic societies.

DREADNOUGHT. See BATTLESHIPS.

DRESDEN. See NAVAL PROGRESS.

DRIVER, SAMUEL ROLLES. An English theologian and educator, died Feb. 26, 1914. He was born in Southampton in 1846, and was educated at Winchester and New College, Cambridge. At the university he had a distinguished career and on his graduation received the fellowship. From 1875 to 1883 he was a tutor of New College, and from 1876 to 1884 was a member of the Old Testament Revision Company. He held a foremost place among Old Testament scholars in England, and his researches in Hebrew scholarship led to results of the first importance. In 1883 he was chosen Regius professor of Hebrew and canon of Christ Church, Oxford, succeeding Dr. Pusey, who had held the chair for more than half a century. He published many valuable works dealing with Old Testament criticism, the most widely-known of which is the *Introduction to the Literature of the Old Testament*, first published in 1891 and followed by several editions. His other publications include: *Isaiah: His Life and Times* (1893); *Jeremiah* (a revised translation, with introductions and brief explanations, 1906); *Modern Research as Illustrating the Bible* (1909). He was joint editor of the *Holy Bible*, with various renderings and readings from the best authorities (1898), and joint author of *A Hebrew and English Lexicon of the Old Testament* (1906); and of *Four Papers on the Higher Criticism* (1912). He received honorary degrees from Dublin, Glasgow, Aberdeen, and Cambridge Universities.

DRUG HABIT. See COCAINE AND OPIUM HABIT.

DRY DOCK. See DOCKS.

DUNCAN, ROBERT KENNEDY. An American chemist and writer, died Feb. 18, 1914. He was born at Brantford, Ontario, in 1868, and graduated from the University of Toronto in 1892. In the same year he became a fellow in chemistry at Clark University, remaining there one year. He was instructor in physics and chemistry in several private schools until 1901, when he became professor of chemistry at Washington and Lee University. This chair he held until 1906, when he was appointed professor of industrial chemistry at the University of Kansas. In 1910 he became director of industrial research and professor of industrial chemistry at the University of Pittsburgh. He was visiting lecturer at Clark University in 1911. Dr. Duncan was the discoverer and patentee of

a new process of manufacturing phosphorus, and of a new low-melting glass, and of a process of decorating glass. In 1907 he instituted at the University of Kansas a new scheme of industrial fellowships which grew to remarkable proportions at the University of Kansas and the University of Pittsburgh. He contributed many articles on industrial chemistry to periodicals and magazines. He was the author of: *The New Knowledge* (1905); *The Chemistry of Commerce* (1907); *Some Chemical Problems of To-day* (1911). He also edited the *New Science Series*, and contributed to scientific and popular magazines.

DUNKARDS, or DUNKERS. See BRETHREN, CHURCH OF THE.

DUNLAP, ANDREW. A rear admiral (retired) of the United States Navy, died April 11, 1914. He was born in Ovid, N. Y., in 1844, and graduated from the United States Naval Academy in 1867. In the same year he received appointment as a midshipman and served in the European and Pacific stations. He was promoted to be master in 1870, lieutenant-commander in 1891, commander in 1898, captain in 1902, and rear admiral (retired) in 1906. He served on various sea and shore duties, and in 1896-97 commanded the Coast and Geodetic Survey steamer *Blake*. During the Spanish-American War he commanded the ambulance and hospital ship *Solace*. From 1900 to 1902 he was light-house inspector of the 10th District, and commandant at the naval station at San Juan, Porto Rico, from 1902 to 1906. He was a member of several patriotic societies.

DURNING-LAWRENCE, SIR EDWIN. An English writer and Member of Parliament, died April 21, 1914. He was born in London in 1837, and was educated at University College School and University College, London. In 1867 he became a barrister and two years previous to this he had been elected Member of Parliament as a Liberal Unionist. He continued in Parliament until 1906. His writings include: *History of Lighting from the Earliest Times*; *The Progress of a Century, or the Age of Iron and Steam*; *Bacon is Shakespeare* and *The Shakespeare Myth* (1910).

DUTCH EAST INDIES. Certain colonial possessions of the Netherlands, lying between Australia and the Asiatic continent. The capital is Batavia.

AREA AND POPULATION. The Dutch East Indies are composed of two main divisions—(1) Java (16 residencies) and Madoera (1 residency); and (2) the outposts (17 provinces). In the table below are given the area and population (approximate for the outposts) of Java, Madoera, and the outpost provinces, according to the census of 1905:

	Sq. Miles	Population
Java	48,686	28,604,719
Madoera	2,090	1,493,289
Outposts		
Island of Sumatra:		
Sumatra, West Coast	81,788
Padang Highlands		403,481
Padang Lowlands		905,040
Tapaoeli		413,301
Benkoelen	9,437	204,269
Lampung Districts	11,838	158,518
Palembang	58,718	796,354
Sumatra, East Coast	85,481	568,417
Atjeh	20,550	582,175
Riouw*	16,379	112,216
Banka	4,473	115,189

	Sq. Miles	Population
Billiton	1,869	86,858
Borneo, West District	56,061	450,929
Borneo, South & East Dist.	157,587	782,726
Island of Celebes.†		
Celebes	49,600	415,499
Menado	22,177	486,406
Ambolna†	19,870	299,004
Ternate†	176,598	370,902
Timor	17,782	808,600
Ball and Lombok	4,063	528,585
Total	739,547	37,981,877

*Consists of Indragiri in Sumatra and the Riouw and Lingga archipelagoes.

†Included in Ternate are a part of eastern Celebes Island, Dutch New Guinea, and a part of the Moluccas; the rest of the Moluccas are in Ambolna. Dutch New Guinea extends to 141° E., with estimated area, 152,428 square miles, and estimated population, 262,000.

The foregoing population figures are for the most part necessarily approximations, and the population of several unexplored regions is not included; the figures for Java and Madoera, however, may be regarded as accurate. Eurasians and persons of pure European blood numbered 80,910, mostly Dutch, and mostly born in the East Indies; Chinese, 563,449; Arabs, 29,588; other Orientals, 22,970. The total native population (exclusive of New Guinea) numbered 37,020,460, of whom 29,715,908 were in Java and Madoera. The Dutch maintain religious liberty. In 1905 there were among the natives and Orientals about 460,000 Christians. For the education of Europeans and Eurasians there are public elementary and middle-class schools, as well as private schools.

PRODUCTION, COMMERCE, ETC. The principal products are sugar, coffee, cinchona, tobacco, tea, indigo, tin, coal, salt, gums, bark, and spices. The total area planted to rice in 1912 was 3,342,084 bahoes (1 bahoe = 1½ acres), with an approximate production of 85,514,914 piculs; sugar cane, 281,994 bahoes, 21,562,047 piculs; tobacco, 262,736 bahoes; indigo, 14,583 bahoes; other sown crops, 3,704,660 bahoes. In Java the government coffee plantations covered, in 1912, 59,526 bahoes, producing 81,000 piculs; production from emphyteutic plantations, 272,000 piculs, and from private estates, 29,000 piculs. Production of tea in Java, 29,415,704 kilos; cacao, 2,272,953 kilos.

Government mines at Banka yielded 250,496 piculs of tin in 1911-12; private mines at Billiton and Riouw, 76,914. Coal output, 1912, 408,204 tons; 1913, 411,083 tons. Output of petroleum, 1911, 17,147,650 hectoliters.

Government trade and private trade, merchandise and specie, are given in the table below for three years, in florins:

Imports	1910	1911	1912
Government:			
Mdse.	10,014,468	13,010,500	20,229,755
Specie	2,640,000	780,000	5,170,000
Private:

In thousands of florins are given the values of the principal exports in 1912 (the latest available figures), as follows: Sugar, 134,630; tobacco 97,088; tin 52,554; copra 49,491; coffee 30,726; petroleum 24,196; tea 23,334; skins 7585; rice 7547; pepper 7158; rattan 5811; gums 5682; quinine 3707; rubber 2824; and nutmeg 1505.

In the merchant marine in 1912 were included 204 steamers of 329,009 cubic meters capacity, and 4994 sailing vessels, of 141,462 cubic meters capacity—a total of 5198 vessels, of 470,471 cubic meters, against 9610, of 591,578 cubic meters in 1911, and 12,669, of 621,292 cubic meters in 1910. There entered at the ports in the 1911 trade, 6484 steamers, of 4,454,546 tons, and 35 sail, of 26,196 tons. There were reported at the end of 1911, 1602 miles of State and private railways, 10,902 miles of telegraph lines with 574 stations; post offices, 364.

FINANCE AND GOVERNMENT. Revenue and expenditure for three years are shown in the table below, in florins:

	1912	1913	1914
Revenue	267,647,706	273,608,208	256,957,128
Expenditure . .	266,412,111	313,096,644	335,050,638

The colony is administered by a Governor-General—A. W. F. Idenburg in 1914 (appointed Aug. 20, 1909).

ARMY. The Dutch colonial forces consist of 29 battalions of infantry, and 4 depot battalions, 4 squadrons of cavalry, 4 field batteries, 4 mountain batteries, 15 fortress companies of artillery, and 5 engineer companies. The army is mixed, in most battalions 1 European company to 3 companies of natives, though the latter are officered by Europeans, and have in part European noncommissioned officers, while the artillery has European gunners. In 1913 there were 1306 officers, and 33,403 men, of whom 11,745 were Europeans, in the colonial army, and a small reserve formed of both Europeans and natives.

DUTCH GUIANA (SURINAM). A colony of the Netherlands (between 46,000 and 49,000 square miles) on the northern coast of South America. The population, exclusive of negroes in the interior, totaled 84,882 in 1912. The capital is Paramaribo, with 34,459 inhabitants. The sugar production in 1912 was 9,634,400 kilos; molasses, 197,100 liters; rum, 989,900 liters; cacao, 864,000 kilos; coffee, 196,900 kilos; corn, 1,290,600 kilos; rice, 2,659,300 kilos; bananas, 256,500 bunches. The country contained (1912) 7218 cattle, 263 horses, 176 mules, 593 asses, 107 sheep, 2812 goats, and 3618 swine. The gold production in 1912 was 743,199 grams, valued at 1,018,183 florins (1,081,476 grams, 1,481,622 florins in 1910; 955,148 grams, 1,308,553 florins in 1911); gold export in 1912, 716,488 grams, valued at 981,588 florins (1,055,528 grams, 1,446,073 florins in 1910; 928,056 grams, 1,271,437 florins in 1911). Total imports in 1912, 7,494,063 florins; exports, 6,619,937 (8,273,590 and 9,201,669 in 1911). Vessels entered in the 1912 trade, 238, of 211,214 tons. Estimated revenue, 1914, 6,262,000 florins; expenditure, 7,052,000; 6,425,000 and 7,294,000 florins in 1913; 6,105,000 and 4,414,000 in 1912. Subvention, 1914, 790,000 florins. The Governor in 1914 was W. D. H. (Baron) van Asbeck.

DYNAMO-ELECTRIC MACHINERY. In the design and construction of motors and generators there were no epoch-making events during the year to record, although very large dynamos continued to be built in increasing numbers. The installation of the 35,000 kilowatts turbo-generating set of the Philadelphia Electric Company, referred to in the 1913 YEAR BOOK, was completed in 1914. This generator was designed to run at 1200 revolutions per minute, and deliver 60-cycle, three-phase energy at 13,200 volts. For the excitation of this machine a 150 kilowatts shunt-wound generator was mounted on the same shaft furnishing current at 250 volts. A novel feature of the construction of the main alternator was the provision for observing, at all times, the temperature in different portions of the windings. Thermoelectric couples were inserted at the ends of the coils, in the bottom of the slots of the armature, and at various other parts of the machine where the rise in temperature under load could be under the observation of the station attendant. This was probably the first instance of the use of this method in commercial work. As this turbo-generating unit was installed chiefly for the purpose of supplying energy to the Pennsylvania Railroad, the latter was building, at the close of the year, a substation near the main station of the Philadelphia Electric Company, containing machinery for converting and distributing energy for use on the lines that were in process of being electrified to Paoli and to Chestnut Hill. (See ELECTRIC RAILWAYS.)

In New York, three 30,000-kilowatt turbo-generating units referred to in the 1913 YEAR BOOK were installed by the Interborough Rapid Transit Company. At Chicago, tests made on the two 25,000-kilowatt turbo-generator units at the Fisk Street Station, one an English and the other an American machine installed during the year, showed unusually high electrical efficiency with a corresponding reduction in the fixed charges per kilowatt. The construction of large synchronous rotary converters for use in substations was continued, and several of a capacity as great as 4000 kilowatts were installed for heavy railway work.

An unusual arrangement, comprising the employment of a synchronous motor for controlling the voltage and the power-factor of a long high tension line, was exemplified on the 240-mile transmission line of the Big Creek Power System in California. The machine, which constituted a large synchronous condenser, was located at the receiving end of the line, controlling the voltage and power-factor through its variable degree of excitation. This plan was not regarded by engineers as in all cases justified, but for so important a line the expense, though high as compared with the installation of inductive reactances, was considered warranted by the superior regulation secured. This use of a synchronous motor at the receiving end of a transmission line was used elsewhere to a limited extent, and for many purposes, such as pumps and compressors, the synchronous motor appeared to be used in increasing numbers. For most industrial purposes, however, the induction motor was the type most generally employed. In the construction of motors a notable event was the use of the so-called split-phase

principle for alternating current railway motors, and at the close of the year the Westinghouse Company had built and was testing on the Norfolk and Western Railway several locomotives designed for heavy coal traffic on steep grades. These locomotives were equipped with four induction motors, designed to develop 1300 horsepower at 14 miles per hour. See ELECTRIC RAILWAYS.

DYSENTERY. Nixon, of San Antonio, Texas, called attention to the value of *chaparro amargosa* in the treatment of amebic dysentery. At present the best known treatment is by emetin, an alkaloid of ipecac, which drug was used in its crude form for many years by the English surgeons in the East. *Chaparro amargosa* is a small thorny bush 2 or 3 feet high, indigenous to south Texas and Northern Mexico. Its name was given it by the Mexicans and means "bitter bush." Botanically, it belongs to the order of *Simarubaceæ*; classed as *Castela nicholsoni*. It was said that General Taylor's soldiers learned its use during the Mexican War, and at various times since then attempts have been made to bring the remedy before the medical profession, but it apparently never attained more than a local reputation. Nixon states that the use of *chaparro* results in rapid cure. He used the drug in infusion both by mouth and rectal enema. Patients who have been ill for months were cured at the end of a week. The ameba disappears from the intestinal tract sometimes in 48 hours after the beginning of the treatment.

EARTHQUAKES. The year 1914 was not extraordinary for the number or magnitude of the individual earthquakes that were added to the record. There were few destructive shocks and none of them probably could be classed as of the first magnitude, certainly none occurring within the more populous regions. The Mediterranean area, as in the few preceding years, seemed to be in a state of seismic unrest, with principal centres of disturbance in Sicily, not far from the scene of the Messina catastrophe, and in Western Greece and the Ionian Islands. The severest shock in Sicily was felt on the evening of May 9, and affected a zone extending along the southern slopes of Mt. Etna as far south as Catania. It inflicted loss upon the communities of Acireale, Bongiardo, Linera, and Santa Venerina, the dead numbering over 100. Linera, a village of 800 inhabitants, was totally wrecked. Catania was severely shaken, but escaped any great damage. Several heavy shocks were reported in Japan, where the outburst of Sakura-jima, a volcano on the small island of Sakura near Kagoshima, was the cause of considerable devastation, with attendant earthquakes. The latter precipitated a slide of rock in the vicinity of Kagoshima which overwhelmed many of the people. The principal disturbance in the eastern Mediterranean occurred on November 27, when the Ionian Islands and the adjacent mainland experienced a heavy shock; it was centred near the island of Santa Maura where the movement caused landslips and other physical changes of the surface, besides involving some loss of life.

The occurrence of slight but plainly sensible tremors over the northeastern part of the United States and Southern Canada aroused much interest and some alarm among the people of that section. The shock took place soon after 1:30

P.M. (Eastern time), February 10, and consisted of several oscillatory movements lasting altogether from 10 to 20 seconds. It seems to have had its greatest energy in central and northern New York and the section of Canada bordering Lake Ontario and the upper St. Lawrence. It was also felt in central New England, in northern New Jersey, and as far west as Chicago. There was no attendant damage to speak of, although in some places the buildings rocked so as to precipitate articles that were delicately balanced, to crack plaster, and cause slight sounds. The effects were most apparent where the buildings rested upon earth, those on rock foundations being scarcely disturbed, as usually happens. No doubt exists as to its being a true tectonic shock, caused by some slip or adjustment of the rock structure below the surface, of the same essential nature as the very powerful earthquakes. The section of country over which it extended is only rarely visited by seismic disturbances perceptible to the senses. The rocks belong to the older formations which have undergone no great displacement from tectonic sources since the Appalachian uplift at the close of Paleozoic time. They have had, thus, a long time in which to reach a state of equilibrium. Nevertheless, it is known that they are traversed here and there by faults which mark lines of weakness and along which any accumulations of crustal strain may find relief. One of these lines of weakness, known as Logan's fault from the Canadian geologist of that name, has a north and south trend along the lower St. Lawrence and the Green and Taconic mountain ranges. From the general features of the recent disturbance it appears not unlikely that the source lay within this fault or some of its branches.

EARTH'S RIGIDITY. See GEOLOGY.

EAST AFRICA PROTECTORATE. The territory lying between the Umba and Juba Rivers, from German East Africa to Italian Somaliland and Abyssinia, and extending inland to Uganda; a British dependency. Besides seven provinces and a semiorganized northwestern tract, it includes certain coastal territories leased from the Sultan of Zanzibar, extending 10 miles inland from the German frontier to Kipini. The lease also includes the Lamu Archipelago and an area of 10 miles around the fort of Kiskayu. The original concession was made to the Imperial British East Africa Company, but was transferred in 1895 to the Imperial government; on April 1, 1905, it was transferred from the Foreign Office to the Colonial Office; on Nov. 9, 1906, by an order in council, the protectorate was placed under a governor and commander-in-chief. Total estimated area, 200,000 square miles, with a population estimated at 4,000,000. The administrative districts returned in 1910 a population of 2,295,336. Arabs and Swahilis predominate along the coast; in the interior are the Masai, Somalis, Gallas, and various Bantu tribes. Paganism prevails except along the coast, where Mohammedanism has made progress. Nairobi is the capital and the central station on the Uganda Railway. It has about 14,000 inhabitants, and Mombasa, the largest town and chief port, has about 30,000. Kilindini, with its magnificent harbor, will be the centre of distribution for the equatorial African trade when certain projected improvements have been completed.

The distribution of agricultural lands in 1912 was as follows: 9844 acres freehold, 328,189 lease; of this total (338,033 acres), 27,888 were devoted to agriculture and 310,145 to grazing. Experiments are on foot looking to a large extension of cotton cultivation. Potatoes, fruits, and vegetables are exported from the highlands; cereals and coffee have an increased cultivation. Cattle, sheep, and ostriches graze the uplands. Rubber, gum-copal, and timber are brought from the forests, and sisal and rubber are being extensively planted. Iron, graphite, limestone, gold, and carbonate of soda are known to exist; opals are mined. In 1912-13, the imports were valued at £1,808,343, against £1,330,437 in 1911-12; exports, £1,203,201, against £1,016,898 in 1911-12. Customs receipts, 1912-13, £146,085, against £101,088 in 1911-12. The United Kingdom received imports valued at £722,147, and dispatched exports to the amount of £490,534. Tonnage entered and cleared, 1912-13, 1,635,640, against 1,563,659 in 1911-12.

The Uganda (Mombasa-Victoria) Railway is operated as a State line by the East Africa Protectorate. The average mileage operated in the fiscal year ending March 31, 1914, was 602 as against 586 in the previous year. The steamers on the lake are also worked in connection with the railway. Telegraph lines, 2284 miles, exclusive of the lines in Uganda. Revenue and expenditure for 1912-13 were £952,525 and £961,178 respectively, against £729,078 and £772,354 in 1911-12. The Governor in 1914 was Sir H. C. Belfield (appointed in 1912).

ECONOMIC ASSOCIATION, AMERICAN. The twenty-seventh annual meeting of the Association was held in Princeton, N. J., from Dec. 28 to 31, 1914. The American Statistical Association and the American Sociological Society also held meetings at the same time and place. Among the speeches and papers were the following: "Speculation on the Stock Exchange and Public Regulation of the Exchanges," "Market Distribution," and "The Relation of Education to Industrial Efficiency." Joint meetings were held with the American Statistical Association and the American Sociology Society. Papers were read or subjects were discussed at the meeting by: Samuel Untermeyer, Dr. Henry C. Emery of Yale University, Royal Meeker, United States Commissioner of Labor Statistics, Dr. Edward D. Jones of the University of Michigan, and Frank H. Dickson of Dartmouth College. The officers of the Association are Prof. John H. Gray of the University of Minnesota, president, and Allyn A. Young of Cornell University, secretary. The Association was organized in 1885 and has about 2500 members. See also section so entitled, under POLITICAL ECONOMY.

ECONOMIC GEOLOGY. See GEOLOGY.

ECONOMICS, SOCIAL. See SOCIAL ECONOMICS.

ECUADOR. A South American republic on the Pacific coast between Colombia and Peru. The capital is Quito.

AREA AND POPULATION. The eastern limits of the country are not definitely established, but, pending a settlement of the boundary disputes with Colombia and Peru, the area of Ecuador is stated at 299,600 square kilometers (115,676 square miles); including the Galápagos Islands, 307,243 square kilometers (118,627 square miles). The population is estimated at 1,500,

000. The Galápagos Islands are reported to have about 400 inhabitants. The majority of the people are Indians, and there are perhaps 400,000 mestizos; the proportion of pure white inhabitants is very small. Much uncertainty exists in respect of urban populations; estimates, which are hardly to be regarded as better than mere guesses, are: Guayaquil, 80,000; Quito, 70,000; Cuenca, 40,000; Ríobamba, 18,000; Latacunga, 18,000; Ambato, Ibarra, Loja, and Puerto-viejo, each 10,000.

EDUCATION. Primary instruction is free and nominally compulsory, but illiteracy is prevalent. According to the presidential message of Aug. 10, 1912, the total number of public, municipal, and private schools was 1590, with 2326 teachers and 98,413 pupils. The 1913 message reported the public schools at 1266, with an enrollment of 65,531. For secondary education, the government supports 12 institutes, which in 1912 had a total average attendance of only 1228. For higher and professional education, there are the Central University at Quito, the University of Guayas at Guayaquil, and the University of Azuay at Cuenca; there are also commercial and technical schools at Quito and Guayaquil, and a law college at Loja. The State religion is Roman Catholicism.

PRODUCTION AND COMMERCE. The products of Ecuador include cacao, coffee, rice, sugar cane, tobacco, vegetable ivory, and rubber. Cotton cultivation has become almost negligible, and the rubber industry has suffered from the thriftless exploitation of the trees. By far the most important crop is cacao, for which Ecuador supplies a large part of the world's demand, though the proportion is smaller than formerly; the average Ecuadorean output has not declined, but that of other countries, notably Brazil, has in recent years increased. During 1913 cacao to the amount of 85,908,495 pounds was delivered at the port of Guayaquil from the producing districts, as compared with 72,892,014 pounds in 1912. The quantity delivered at other ports of the country is comparatively small. Ecuador has valuable mineral resources, but they have been largely exploited. Aside from Panama hats, which are produced in large numbers, manufactures have little commercial importance.

Imports and exports have been valued as follows, in thousands of sucres:

	1907	1908	1909	1910	1911	1912
Imports:						
Mdse.	18,692	16,959	14,418	21,990
Specie	1,862	1,746	2,064	1,650
Total ..	19,670	20,554	18,705	16,477	23,640
Exports:						
Dom.*	23,727	23,977	27,292	26,072	25,480
Reex.†	2,833	902	770	44	2,788
Total ..	22,907	26,560	24,879	28,062	26,116	28,168

* Domestic exports, i.e., exports of Ecuadorean produce.

† Reexports.

Principal classified imports in 1911, in thousands of sucres: textiles, 6663; foodstuffs, 3445; hardware, 1480; machinery, 1387; ready-made clothing, 824; wines, liquors, etc., 705; drugs, etc., 658; arms, ammunition, etc., 584; mineral products, 460; cordage, etc., 440; leather, 344; paper, etc., 308. Principal domestic exports in 1911 and 1912 respectively, in thousands of sucres: cacao, 16,095 and 15,716; Panama hats,

2890 and 2817; vegetable ivory, 1804 and 1923; coffee, 2281 and 1609; rubber, 1433 and 1435; gold, 525,428 and 629,418; cattle hides, 409 and 606.

COMMUNICATIONS. The total length of railway in operation in 1912 was about 370 miles; of this, 297 miles are comprised in the Guayaquil-Quito line, which was completed June 25, 1908. A short line (only 19 miles) runs from Puerto Bolívar to Machala, Pasaje, and Guabo. A line from Bahía de Caraquez to Quito has been under construction since July, 1909, and one from Manta, on the coast, to Santa Ana since July, 1910. Construction has been begun also on lines from Ambato to Curarray and Huigra to Cuenca. At the end of 1912, there were 3318 miles of telegraph line, with 186 offices. Post offices, 151.

FINANCE. The standard of value is gold. The monetary unit is the sucre, par value 48.665 cents (one-tenth of the Ecuadorean condor or of the British sovereign). Revenue and expenditure have been as follows, in thousands of sucres; the figures for 1913 and 1914 are estimates:

	1910	1911	1912	1913	1914
Revenue . . .	15,117	13,264	19,978	20,387	20,760
Expenditure	15,479	15,836	19,950	20,387	20,760

The principal items of revenue are import duties and export duties, the former amounting in 1912 to 8,155,620 sucres and the latter to 4,598,408 sucres. The larger disbursements in 1912 were: for the public debt, 6,927,348 sucres; war and marine, 3,411,810; public instruction, 1,844,696; interior and police, 1,581,325; finances, 1,080,069; public works, 1,003,255. Public debt, Jan. 1, 1913: foreign, 32,217,450 sucres; internal, 12,579,480.

ARMY. There is a regular army recruited nominally by compulsory service between the ages of 18 to 32 and a national guard of citizens from 32 to 45. The army has an establishment of 7810 officers and men, being made up of 13 battalions of infantry, 1 regiment of cavalry, 12 batteries of artillery and some technical and departmental troops. The recruits serve one year then pass to the reserve and the second line which has a theoretical organization of 135 infantry battalions, 7 regiments of artillery, and 44 squadrons of cavalry.

NAVY. The navy consists of a small cruiser (*Cotopaxi*, 736 tons), a torpedo-boat destroyer (*Bolívar*, 1000 tons), a torpedo boat (*Tarqui*, 56 tons); three launches, and an auxiliary vessel. Personnel, about 200 men.

GOVERNMENT. Under the constitution, the executive authority is vested in a president elected for four years by direct vote. He is assisted by a cabinet of five ministers. There is no vice-president. The legislative power devolves upon a congress of two houses, the Senate (32 members, elected for four years), and the Chamber of Deputies (48 members, elected for two years). For the term beginning Aug. 31, 1911, Emilio Estrada was inaugurated President in succession to Gen. Eloy Alfaro. Estrada died Dec. 21, 1911, and, in accordance with the constitution, was succeeded by the president of the Senate, Carlos Freile Zaldumbide, as acting President. There followed a revolutionary outbreak, headed apparently by friends of General Alfaro (who was killed). The president of the Chamber of Deputies, Francisco Andrade Marín, succeeded

to the position of acting President. On March 31, 1912, Gen. Leonidas Plaza, who was commander of the government forces, and who had been President in 1901-5, was elected President, and on the 31st of the following August was inaugurated for a four-year term.

HISTORY. At the beginning of the year the government forces made several attempts to capture the port of Esmeraldas, which had been held since the middle of December, 1913, by the rebel leader, Col. Carlos Concha. Colonel Concha, it will be recalled, was a Liberal, as was also President Plaza, but the former belonged to the Alfariista faction of Liberals who resented the coup by which General Plaza had superseded President Alfaro in 1912. In February, 1914, the government ordered the entire navy to cooperate with the land forces in the operations against Esmeraldas. The combined attack achieved a momentary success, but the city again fell into the hands of the rebels and was in great part given over to flames. In March the menace of superior forces caused Colonel Concha to withdraw from Esmeraldas. President Plaza entered the city in triumph. But in April Esmeraldas was once again besieged, and the Federals lost 500 killed and wounded and 200 captured. In April it was further reported that the revolution had collapsed when two of its leaders—Andrade and Pacquel—were captured. Nevertheless, in August the government found it necessary to send fresh troops to the coast province of Manabí, south of Esmeraldas, to cope with renewed revolutionary disturbances. On August 10 the Congress met at Quito and elected Agustín Cabezas as president of the House of Representatives, and Alfredo Bacquerizo Moreno as president of the Senate. See also *INTERNATIONAL ARBITRATION AND PEACE, Bryan-Wilson Treaties*.

EDISON FIRE. See *FIRE PROTECTION*.

EDUCATION. See section so entitled under various foreign countries.

EDUCATION, VOCATIONAL. See *EDUCATION IN THE UNITED STATES*.

EDUCATION IN THE UNITED STATES.

STATISTICS. *Attendance in Elementary Schools.* According to the latest report of the United States Commissioner of Education covering the school year 1911-12 there were 17,077,577 pupils in public, and 1,505,637 pupils in private elementary schools. About 73 per cent of this number were in daily attendance for a period that averaged 158 days. More than 91 per cent of all pupils and students attending educational institutions are in the elementary schools. This is 19 per cent of our total population, and 72.25 per cent of all persons from 5 to 18 years of age. Within the elementary school, 23 per cent of the pupils are attending the first grade, while on the average, only about 6 per cent reach the eighth or last grade. There were in the Southern States, where all schools for negro children are separate from the white schools, a total of 1,769,859 colored pupils. It is noteworthy that while the enrollment of white children in the common schools of these States has increased 28 per cent since 1900, the enrollment of negro children increased only 13 per cent. This relative increase of colored pupils enrolled in the public schools was less than the per cent of increase of colored population in those States for the same period. A smaller proportion of negro children from 5 to 18 years are now enrolled in the public schools than were enrolled in 1900.

Teachers in Elementary Schools. In 1912 a total of 493,436 teachers were employed in the public elementary schools, of which number, 91,636, or 18.5 per cent, were men. The proportion of men teachers is less than one-half what it was in 1880. The relative number of men teachers in elementary schools in the United States is less than is found in similar schools in any of the important European countries for which data are available. Austria employs about 66 per cent men, Switzerland 60, Germany 53, Belgium 44, France 42, and England and Wales 33.

Attendance in High Schools and Academies. For the school year 1912-13 there were 1,134,771 students in public, and 148,238 students in private secondary schools, of which number 22,710 were colored students. There were 57,349 secondary students in the preparatory departments of colleges and universities, and probably at least 50,000 more were enrolled in preparatory departments of other higher institutions. More than 64 per cent of all the secondary students in private schools were in denominational institutions. The Roman Catholics led with 45,303 students; the Baptists had 10,159; the Episcopalians, 6,935; the Mormons, 5,991; the Methodists, 5,621; the Presbyterians, 4,431; the Methodist Episcopal South, 4,029; the Lutherans, 3,311; the Friends, 2,852; the Congregationalists, 2,250; and all other denominations, 5,788 students.

It is estimated that about 41 out of each 100 high school students are in the first year of the course, and that only 13 per cent reach the fourth or last year. In June, 1913, 167,117 boys and girls were graduated from high schools. Of this number, 59,975 had prepared for college, and 25,886 for other higher institutions.

Prior to 1888 the private high schools and academies enrolled more students than the public secondary schools. From that date the proportion of students in the private institutions decreased until it reached its lowest point, 10.02 per cent in 1908-09. Since then the number of students in the private high schools has increased nearly 60 per cent, while the increase in public high schools has been less than 35 per cent.

Teachers in Secondary Schools. The public high schools employed 23,412 men and 30,326 women teachers, this being an average of one teacher to every 21 pupils enrolled. The corresponding figures for the private schools were 5,656 men, 7,698 women, and an average of 11 students to each teacher.

Kindergarten Attendance. In 1912 there were 6,371 public kindergartens with 311,970 children. There were also 994 kindergartens other than public, with 52,219 children enrolled. In 1902 there were 3,244 kindergartens with 205,432 children; equivalent to enrolling 5 per cent of the children 4-6 years, the usual kindergarten age. In 1912, 9 per cent of the children of kindergarten age were attending.

Attendance in Parochial Schools. The 1913 Report of the United States Commissioner of Education contains a chapter on Roman Catholic Parochial schools by Rev. Patrick J. McCormick. The number of schools for 1913 were 5,256, and the pupils enrolled, 1,360,761. There has been an increase of about 27 per cent in schools and 40 per cent in number of pupils since 1900. It is estimated that the total expenditures for these

parochial schools in 1912-13 was \$10,886,086, or an average of a little more than \$8 per pupil. Professor McCormick estimates that were these children to attend the public schools, the cost to tax payers would be \$21,902,400, and that to provide school buildings and equipment would require at least \$84,325,450.

In 1912 there were a total of 5,883 Lutheran parochial schools, 3,758 teachers, and 272,914 pupils.

Cost of State Common Schools. The estimated cost of the public elementary schools for 1912 was \$423,860,569, and for public high schools, \$59,026,224. One-third of the total expense of the common schools is borne by the 50 cities having a population of 100,000 or over, but these same cities enroll only one-fifth of the total number of school children. The South Central States raise the smallest and the North Central the greatest proportion of the school revenue from local taxes. In the former States it is 54.34, and in the latter, 81.89 per cent. The same sections represent the extremes in respect to State taxation for school purposes. The Southern group depends upon the State for 30.89 per cent of its school funds, and the Northern for 9.70 per cent.

About 59 per cent of the school expenditures are for teachers' salaries. The average monthly salary for men teachers was \$78.08, and for women, \$58.04. The average length of school year was 7.9 months.

The increase in school expenditures since 1880 is noteworthy. At that date the expenditure per capita of total population was \$1.56; ten years later it was \$2.24; it was \$2.84 in 1900, and in 1912 it was \$5.05. During this time the per cent of the population enrolled in the common schools has remained about constant. The average length of school term has increased from 130 to 158 days, and the average annual cost per pupil from \$12.71 in 1880, to \$36.30 in 1912. The average monthly wages of teachers has changed from \$29.26 to \$62.23.

The estimated value of public school property in 1912 was \$1,266,382,277. This is more than five times the value of school property in 1880. The expenditures for sites, buildings, libraries, and apparatus in 1912 was \$78,018,967.

EDUCATIONAL INVESTIGATIONS AND SURVEYS. Interest in investigating school systems continued through the past year. Two States, Illinois and Maryland, authorized state-wide investigations of their schools. The former secured Professor Lotus D. Coffman of the Illinois State University as director, and the Southern Educational Board has undertaken the work in Maryland. Two cities have also had extensive investigations. The board of education of Springfield, Ill., appropriated \$1,000 for the purpose of a survey of their school system, and invited Dr. Leonard P. Ayres of the Division of Education, Russell Sage Foundation, to direct the work. The report covers 160 pages, and was published by the Russell Sage Foundation. The total cost of this survey was approximately \$3,200. All expenses other than those met by the board's appropriation were defrayed by the Foundation.

About May 1st, the board of education of Butte, Mont., passed the following resolution:

"Resolved, that a survey be made of the schools of School District No. One, by Dr. George B. Strayer of Teachers College, Columbia Univer-

sity, New York City; Dr. Ellwood Cubberley, head of the Department of Education, Leland Stanford University; and Dr. Frank P. Bachman of New York City, and two assistants. Such survey to commence as soon as practicable, and there is hereby appropriated and set aside from the General Fund of the said School District the sum of Four Thousand Dollars (\$4000) to pay the expense of said survey and for the cost of a report from the said persons to the Board of Education as to the conditions of the said schools."

The gentlemen named accepted the appointments, and with two assistants spent one month in the city in examining the schools and making the report, which covers 163 pages, and was printed by the city.

It is not possible in a few words to summarize the findings and recommendations contained in the reports mentioned. In common with most of the other surveys that have been made they call attention to the failure of the course of study in meeting the needs of the children, and the poor quality of most of the teaching. There is a lack of efficient supervision of teachers, and unhygienic conditions exist in many buildings. In each report there are many constructive suggestions regarding the improvement of both the educational and business sides of school management.

The first extensive school survey was made in Baltimore in 1911. Since that time there have been surveys in more than a dozen cities and in two States. The benefits that have come as a result have not been confined to the cities and States concerned. Local school officers everywhere are studying their schools, and endeavoring to strengthen them. Several of the larger cities, notably New York, San Francisco, and New Orleans, have organized departments of educational research, and placed competent directors in charge.

A study of the various survey reports shows that there is no fully accepted body of standards for judging school efficiency. It is noteworthy that each investigator feels it necessary to devote considerable space to a justification of the principles that he employs in judging the quality of instruction, supervision, and the course of study. Questions of finance, attendance of pupils, and similar matters susceptible of statistical treatment, are usually presented in convincing form, but factors of school work, which are not capable of quantitative treatment, are not in general presented so as to carry conviction to the reader.

JUNIOR HIGH SCHOOLS. An increasing number of cities are considering the advisability of reorganizing their school systems by introducing junior high schools. These schools will take the pupils from the present seventh and eighth grades of the elementary school, and from the first year of the high school as now organized. The twelve years of the elementary and high school courses are thus divided into three periods, consisting of six years in the elementary school, three years in the junior high school, and three years in the high school. This same organization is by some called the "six and six" plan, and by others the "intermediate school."

The principal arguments in favor of this newer organization may be stated as follows: The present division of time between the elementary school and the high school is largely the result

of traditions which grew up around the old academies. It fails to meet either the social or the psychological requirements of children. If a child enters school at 6 years he should under present conditions enter high school when he is 14 years. This is the age at which the changes due to adolescence are most important. It is argued that if children could begin their high school work at the age of 12, by entering the junior high school, the influence of changes would not be so injurious as now. It is urged that this change from one school to another now comes at the time when the compulsory education law permits children to leave school. If children could get well established in the high school before this age they would in all likelihood remain to complete the course. It is generally agreed that the studies now given to boys and girls in the upper elementary grades are not well adapted to the needs of the children. In most cases the aim is to fit children for the high school, while only about one-half enter the high school, and only one in ten finish the course. The junior high school offers the opportunity to differentiate the courses, and thus to meet the different needs and interests of the children. Three types of courses for schools are provided: A general course for those pupils who will enter the high school, and from there go to college, vocational courses for boys and for girls who will go to technical high schools, or who will at once go to work, and commercial courses for those who will become stenographers and other commercial helpers.

Those who oppose the plan, urge that 12 years is too young for children to know what course they should take, and that the scheme is not democratic.

The chief difficulties that have been encountered in the establishment of junior high schools have been the lack of suitable courses of study, and the scarcity of teachers who have the academic training usually required of high school teachers, and the professional training required of elementary school teachers. The following are among the cities that have introduced some form of junior high school: Berkeley, Cal., Evansville, Ind., Grand Rapids, Mich., Los Angeles, Cal., and Norwalk, Conn.

TEACHERS' PENSIONS. Pension systems have been in force in many of the larger cities for some time. It is only recently, however, that the various States have given the matter serious consideration. At present eleven of the States have some form of teachers' pension system.

The provisions of the pension laws that have been enacted vary greatly. In some States, notably Arizona, Maine, Maryland, and Rhode Island, pensions are provided without salary deductions, while in the other States some form of contribution is required of the teacher. A variety of methods are employed to secure the part of the fund that the State must supply; California contributes 5 per cent of the inheritance transfer tax moneys, Oregon 3 per cent of the school moneys, North Dakota 10 cents, and Washington 20 cents for each child of school age.

Experience has shown that when the salary of the last year is taken as a basis of the pension, school boards are inclined to increase the salary in order that the retiring teacher may obtain a larger pension.

The most common method of allotting pensions now is to give an amount equal to 50 per

cent of the average annual salary of the last five years of service.

Actuaries have expressed considerable doubt as to the success of most of the plans thus far adopted. It is claimed that few States have made adequate provision to meet the demands that will eventually be made on their pension funds. Even thus early in the life of teachers' pension systems there have been persistent rumors that several of them are certain to become bankrupt unless the cities in which they exist come to their aid.

The Massachusetts system is regarded as one of the safest. It requires an assessment of from 3 to 7 per cent of the teacher's salary. The State undertakes to pay an amount "equal to an annuity yielded by the total amount of assessments paid by the teacher, plus three per cent compound interest, together with an amount of the annuity granted by the State." No person is eligible for retirement before 60 years, and there is compulsory retirement at 70 years.

TRAINING SCHOOLS FOR TEACHERS. There were 230 public and 54 private normal schools in 1912-13. In the former there were 87,172, and in the latter, 7,282 students. All these schools graduated 20,872 students in June, 1913. Since 1890-91 there has been an increase of 75 per cent in the number of public normal schools; of 197 per cent in the number of students in them; and 283 per cent in the number graduated by them. In most cases the normal school aims to prepare teachers for the elementary school only. The total number of elementary school teachers required in 1911-12 was 535,058. If, therefore, all the elementary schools were to have normal school teachers it would require that the average term of office of teachers should be twenty-five years. If the public schools are eventually to have trained teachers, some way must be devised to greatly increase the facilities for professional training.

VOCATIONAL EDUCATION. Progress in vocational education was more pronounced in 1914 than in any previous year. Various cities established different courses either in existing or in special schools. There has continued to be a conservative tone in discussions relating to industrial education. Superintendents and boards of education are coming to realize the wisdom of moving slowly, and only after a comprehensive report of an expert commission. Three years ago Mr. C. A. Prosser, Secretary of the National Society for the Promotion of Industrial Education, said: "The difficulties of the problem require that we should proceed on the basis of investigation and careful experimentation. We need, perhaps, most of all a frank recognition of the difficulties which have thus far been pointed out, and a diligent search for those as yet uncovered. Everywhere there should be careful, unbiased, scientific, thoroughgoing, and more or less specialized study of social and industrial conditions, industries, occupations, and workers. *The most important contribution that could be made by either public or private agencies would be successful experiments in new fields of industry that as yet remain practically untouched.*"

It is interesting to note that Mr. Prosser has expressed the attitude that is most noticeable at the present time.

At a meeting of the Iowa State Teachers' Association in November, 1913, a committee was appointed for the purpose of investigating and

reporting upon legislation for vocational education and vocational guidance in the State. When this committee met it construed its duties to be the following:

1. The gathering of data from:
 - a. Industries.
 - b. Commercial pursuits.
 - c. Labor.
 - (1) Skilled.
 - (2) Unskilled.
 - (3) Juvenile.
 - d. Education with special reference to waste under existing conditions, caused by
 - (1) Elimination.
 - (2) Retardation.
 - (3) Juvenile delinquency.
 - (4) Inefficient schools.
2. The interpretation of the above data as a basis for the practical recommendations of the committee.

The foreword to the report which was published in November contains the following quotation:

"The committee felt that it would be a very easy matter to make a superficial study of the legislation of Massachusetts, Indiana, Wisconsin, etc., and from such investigation to formulate legislation which it might recommend and possibly secure through the hasty action of the legislature. But it seemed to be the unanimous opinion of the committee that much of this legislation had not been successful, that all of the States in which work had been done were more or less open to criticism as to the real value of some phases of their legislation; and more than this, that Iowa presented definitely her own problem and that this problem must be known, not through hasty reports and immature conclusions, but by means of a thorough survey of all of those phases which enter into the industrial and vocational life of the State.

"It was also thought that any legislation brought forth hastily before such a survey had been made and interpreted, must of necessity bring to Iowa far greater mistakes than those mentioned in any of the preceding States. Consequently, the committee has attempted to begin a big thing, a piece of work that could not be accomplished in the length of time given to the committee for its report.

"In many cities the Boards of Trade or similar organizations are coöperating with the Boards of Education in efforts to determine just what type of training is needed in their cities. The most common practice of such joint bodies is to institute vocational or industrial surveys. The State Department of Education of Indiana offers the following suggestions:

"The first step in the establishment of a vocational department or school is to make a preliminary investigation to determine:

- "1. If there is a well defined need for a vocational department or school in that community.
- "2. For what industries or occupations the proposed department or school should prepare.

"This may be done: (1) By ascertaining what has become of the boys and girls who left school at fourteen years of age and determining which forms of vocational education, industrial,

agricultural, or household arts, would best meet their needs. (2) By listing the predominant industries of the community and ascertaining whether or not these offer opportunities for skilled employment and proper inducement for a permanent occupation. (3) By ascertaining the facilities already available for giving vocational instruction in the occupations and industries represented in the community.

"3. It should next be determined to what extent the employers will cooperate with the local school authorities in providing the vocational training most needed in that community.

"4. It must finally be determined whether an all-day school, part-time, or evening classes will best meet the needs of this particular community.

"Such a preliminary investigation should be carried on by the local school authorities or by a committee appointed by them (Board of Trade, Chamber of Commerce, Civic Club, Central Labor Union), working in cooperation with the State Board of Education. The Department of Public Instruction will render whatever assistance it can to any committee making such an investigation and may, in some instances, make the investigation, if requested by the local authorities to do so.

"A plan that has proven very successful in arousing interest in the vocational work is to appoint a local commission on vocational education to study the problem and cooperate with the State department in making such investigation. Such local commission might well consist of employers and employees, representing the industries of the locality, of women of experience in social and industrial activities, representatives of local civic and social organizations, and members of boards of education, and might be continued as a permanent development committee for vocational education in that community."

One of the most significant industrial surveys was conducted in Richmond, Va., under the auspices of the National Society for the Promotion of Industrial Education. The General Survey Committee consisted of the following: Dr. Leonard P. Ayres, Director Russell Sage Foundation, Chairman; Mr. Charles H. Verrill, Chief Editor U. S. Bureau of Labor Statistics; Mr. L. W. Hatch, Chief Statistician N. Y. Bureau of Labor; Dr. J. A. C. Chandler, Supt. of Schools, Richmond, Va.; Prof. C. R. Richards, Director of Cooper Union, New York; Mr. Chas. H. Winslow, Special Agent U. S. Bureau of Labor Statistics; and Mr. C. A. Prosser, Secretary of the National Society.

The Director of the school survey was Dr. Leonard P. Ayres, and the director of the industrial survey was Mr. Charles H. Winslow. The report of the General Survey Committee states that the aims of the survey on the part of the National Society were such as the following:

- "1. To prove the necessity of a knowledge of industrial and school conditions in the making of a programme for industrial education in a city.
- "2. To show the kind of facts about industry and about the schools which need to be gathered.
- "3. To develop a proper method for studying

the industries and the schools for purposes of industrial education.

- "4. To secure the cooperation of national and local public and private agencies in the making of a type survey and to bring to bear upon the task the best expert service and advice that could be secured.
- "5. To make the annual convention of the Society more helpful to the convention city by focusing much of the discussion on its problems, and leaving with it not only information as to conditions and possibilities, but also wide discussion and expert advice through the membership of the National Society and others, as to the development of industrial education in the city."

They state the purposes of the Richmond authorities in having the survey made as the following:

- "1. To make the annual convention in Richmond most helpful to a city interested in providing practical education for its people.
- "2. To give the city a knowledge of the industrial and school facts and conditions which must be considered in developing a programme of industrial education, and the best expert advice as to what Richmond should do and how she should do it, in order that, as one Richmond school official expresses it, "Richmond may not be working in the dark."

EFFICIENCY, MUNICIPAL. See **MUNICIPAL GOVERNMENT.**

EGYPT. A British protectorate in north-eastern Africa; until 1914 nominally under the suzerainty of Turkey, though virtually under British control. Capital, Cairo.

AREA AND POPULATION. Exclusive of the Sudan, the area is given as 363,161 square miles, of which only 12,013 square miles are settled and under cultivation. The population in 1907 numbered 11,189,978, not including nomadic Bedouins, estimated to number over 97,000. By nationalities the population was made up as follows: 10,903,677 (10,366,046 sedentary, 537,631 nomadic) Egyptians, and 286,381 foreigners, of whom 69,725 Turks, 62,973 Greeks, 34,926 Italians, 20,853 British including Maltese, 14,591 French including Tunisians, 7704 Austrians and Hungarians, 2410 Russians, etc. Mohammedans numbered 10,366,826; Copts, 706,322; Jews, 38,635. In 1907 Cairo had 654,476 inhabitants; Alexandria, 332,246; Tanta, 54,437; Port Said, 49,884; Mehala el Kobra, 47,955; Mansura, 40,279; Assiut, 39,442; Damanhur, 38,752; Fayum, 37,320; Zagazig, 34,999; Damietta, 29,354; Minieh, 27,221; Sherbin, 25,473; Akhmim, 23,795; Beni-Suef, 23,357; Menuf, 22,316; Sherbin el Kom, 21,576; Mellawi, 20,249; Qena, 20,069.

EDUCATION. The provincial councils have now become entirely responsible for elementary vernacular education in their districts, and all schools maintained by them are inspected by the ministry of education. The ministry still retains, under its direct control, certain elementary schools belonging to trusts controlled by the

ministry of Waqfs (pious foundations); these schools or "Maktabas" numbered 142 at the end of 1913, with an attendance of 14,027. Higher primary schools, 34, with 7610 pupils; provincial council maktabas 911, with 57,175; private maktabas (grant-in-aid), 3394, with 174,282; provincial council higher primary schools, 78, with 10,493. Total number of establishments under direct management of the ministry of education, 198, with 27,864 pupils; total number of establishments under inspection by the ministry, 4493, with 253,295 pupils. Of the latter total, 227,434 were boys, and 25,861 were girls. A free primary school has been established in Cairo. The demand for secondary instruction increases, and opposition to female education has now almost entirely disappeared. Industrial schools have been founded to meet the requirements of agricultural and industrial districts.

AGRICULTURE. In the table below are shown areas under main crops in feddans (1 feddan = 1.038 acres) in 1913, as distributed in Lower Egypt, Upper Egypt, and the Suez governorate; with the total area for Egypt, and the total yield (cotton and sugar in kantars, other crops in ardebs of 5.44 bushels):

	Lower	Upper	S.G.	Total	Yield
Cotton	1,339,675	383,485	44	1,723,094	7,554,000
Wheat	678,747	626,634	197	1,305,578	6,972,000
Barley	165,785	208,300	78	369,158	2,078,000
Rice	229,149	13,218	..	242,367	1,280,000
Corn	1,178,716	458,471	869	1,632,556	10,850,000
Millet	220,204	..	220,204	1,863,000
Sugar	2,199	46,241	28	48,468	21,629,000

The area under cotton cultivation exceeds that of 1912 by only 1279 feddans. The price of cotton declined during the year, notwithstanding a shortage in the American crop. Of the 1,723,000 feddans reported as planted to cotton in 1913, 486,600 feddans were attacked by the cotton worm, as compared with 980,300 in 1912.

The amount of sugar cane treated was 741,000 tons, as compared with 537,000 in 1912, and the sugar content was 12.8 per cent. The census of live stock in 1913 shows an increase of 17,000 cattle, and a decrease of 19,000 buffaloes. The import of these animals from the Sudan in 1913 was 10,424, and from other countries, 33,605; of sheep and goats from the Sudan, 98,886, and from other countries, 311,603. The percentage of deaths from cattle plague in 1913 was 0.14, compared with 0.42 in 1912. In July, 1912, 186,000 cattle were immunized by double inoculation.

From Lord Kitchener's report, dated Cairo, March 22, 1914:

"The introduction of a system of agricultural coöperation in the village life of the community has been for some time the subject of general discussion. The possibility of successfully working such a system in Egypt, and the advantages to be obtained from it, have been demonstrated by experiments in several villages throughout the country. The creation of a Ministry of Agriculture has greatly facilitated the development of village syndicates, as the new Ministry will be able to supervise and assist the agricultural operations which the coöperative societies will undertake in the villages. Undoubtedly the principal factor on which their success will depend will be the degree of facility with which they are able to obtain advances of money at cheap rates. Such rates can only be obtained by establishing

syndicates on the legal basis of registered civil companies, and by placing their finances under the supervision of the Finance Ministry; as soon as legislation on these lines has been enacted we may hope to see a considerable development of the application of the coöperative principle to agricultural life in the villages. The help thus afforded to the smaller cultivator will be of great value as soon as the direction of the village syndicates has been rendered thoroughly reliable both as regards its operations and its finances."

IRRIGATION. "Considering the abnormally low Nile, the year [1913] has been a far more prosperous one than could have been expected. Formerly, so considerable a shortage of water would have been almost a national calamity, but the completion of the Aswan Dam at the end of 1912 permitted of sufficient storage to mature the cotton crop, the main source of the riches of the country. Unfortunately, the southern portion of the Nile Valley, which is not under perennial irrigation, suffered severely from drought, as the river was not high enough to inundate the basins. A large number of people had in consequence to seek employment elsewhere, but the drainage works in the Delta offered an opportunity of providing many of them with remunerative work. The government gave assistance as far as possible, and the population of the affected districts showed in a most admirable manner that, by hard work, and adapting themselves to the situation, they were able to some extent to make good their losses.

"The low flood, which had this unfortunate effect in Southern Egypt, was followed during the latter part of the year by a serious shortage of water in the river, which has been the lowest on record for over a century, so that, notwithstanding all the storage resources, there will be only just sufficient water to irrigate the cotton crop sown in the spring of 1914, and other cultivation must suffer to some extent; while rice, which requires a disproportionately large amount of water, cannot be grown at all. The views expressed in my last year's report as to the necessity for increasing the supply of storage water for early summer use, by the erection of a dam on the White Nile, have been thus fully confirmed. . . . So far as the summer supply of Egypt is concerned this dam would not, when the possible development of Lower Egypt as well as the conversion of the remaining basins in Upper Egypt is taken into account, be adequate of itself to supply all the water required, though it is certain to meet all requirements for many years to come. Moreover, the erection of a dam as proposed might not be justifiable simply as a means of forming a storage reservoir to increase the Egyptian summer supply, since the true solution of this latter problem apparently would be to deal with the river as it flows from the great lakes, in order to produce a steady and adequate flow. But the site selected has the important advantage of permitting some control of excessive flood waves passing down the main Nile. Therefore the erection of a dam for the double purpose of control of excessive floods, and of incidental use as a storage reservoir, is very thoroughly justified, but its construction will not mean that resort will never be made to regulation on the great lakes as a final settlement of the problem of Egypt's summer water when all available areas are being developed. As a result

of borings on the proposed site it was found that comparatively good rock can be reached at a reasonable depth right across the river bed. Detailed plans have yet to be prepared, but it is expected that the whole work will cost well under £1,000,000."

COMMERCE. In the table below are given imports and exports by principal countries of origin and destination, with the totals, including other, in thousands of pounds Egyptian.

	Imports		Exports	
	1912	1913	1912	1913
Great Britain ...	7,991	8,496	16,022	13,648
Med. possessions. .	253	207	14,000	13,000
Far Eastern pos..	1,314	1,778	123	110
Turkey	2,754	2,724
France	2,411	2,513	2,707	2,787
Aus.-Hun.	1,680	1,940	1,481	1,757
Germany	1,421	1,609	3,886	4,066
Italy	1,243	1,478	949	1,013
Belgium	1,103	1,178
Rumania	691	1,091
United States ...	403	525	4,121	2,485
Russia	2,056	2,242
Switzerland	1,009	1,012
Total	25,908	27,865	34,574	31,662

The total export of cotton has decreased from ££27,529,300 in 1912 to ££25,513,100 in 1913. The United Kingdom took ££10,996,700, as against ££12,572,200 in 1912; the United States, ££2,442,500, as against ££4,072,200 in 1912. Total export of cotton seed was ££3,294,800, of which the United Kingdom took ££1,698,700, and Germany, ££1,480,704. The cigarette export was ££395,000. Coal arrived to the amount of 1,686,700 tons, valued at ££2,010,000, of which the United Kingdom contributed 1,605,000 tons, valued at ££1,909,700. There is a general decrease in imports of articles of food and clothing. The increase of 58 per cent in the Rumanian imports, and 35 per cent in those from the British possessions in the Far East, were due to the shifting of the flour market.

The exports show a decrease of 8.89 per cent. The quantity of cotton exported from the 1913-14 crop in the last months of 1913 was smaller than that exported in 1912 from the 1912-13 crop, and the prices rated lower. The proportion of cotton-seed exported to Germany continued to increase with a corresponding decrease to the United Kingdom.

Tobacco. The withdrawals of leaf tobacco decreased from 8,206,000 kilograms in 1912 to 8,177,000 in 1913. Russian tobacco advanced from 1,027,000 kilograms in 1911 to 1,511,000 in 1912, and 1,853,000 in 1913. Tobacco in bond decreased from 186,000 bales Dec. 31, 1912, to 167,000 bales Dec. 31, 1913, due to the fact that, owing to the disturbed political conditions in eastern Europe, merchants transferred their stocks to Alexandria in 1912. The export of cigarettes has declined by 34,000 kilograms, due to a large extent to the fact that Sweden has lately raised its duty on cigarettes and established local factories.

COMMUNICATIONS. There has been a decrease in railway traffic and a corresponding reduction in receipts—££3,819,000 in 1913, and ££3,916,000 in 1912. Expenditure in 1913, ££2,190,000; in 1912, ££2,291,000. Capital value of railways 1913, ££27,291,943; interest on capital, 5.97 per cent. Capital expenditure on State railways in 1913 amounted to ££446,000. For 1914, expenditure on capital works, ££443,000 were granted.

There were 1512 miles of State railways in operation Jan. 1, 1913. In addition there were 1280 kilometers of light railways—the Egyptian Delta Light Railways, the Chemins de Fer de la Basse-Egypte, and the Fayum Light Railway. There is an increase of 32 kilometers, as compared with 1912, due to the completion of a new line from Salahib to Baltim, constructed by the Delta Light Railway Co.

Steamers entered at Alexandria in the 1913 trade, 1932, of 3,718,660 net registered tons; cleared, 1927 steamers, of 3,698,396. There passed through the Suez Canal in 1913, 4979 vessels, of 19,758,040 net tons.

FINANCE. Revenue and expenditure for three years are shown in the table below:

	1911	1912	1913
Revenue ...	££16,798,000	££17,515,000	££17,468,000
Expenditure	14,872,055	15,470,000	15,728,785

The alteration of the date of the financial year has involved the preparation of an intercalary budget for the first quarter of 1914, which estimates for a surplus of ££155,000. All unused balances lapsed on March 13, 1914, with the inception of the new system. The budget for 1914-15 was estimated to balance at ££18,162,000.

The total outstanding debt Dec. 13, 1913, amounted to ££94,202,540, and the annual charge for interest and sinking fund to ££3,552,000.

ARMY. The Egyptian army, formed of selected recruits, is limited by law to a strength of 18,000 combatants in time of peace, and is recruited by compulsory service, as all male inhabitants are liable. The chief command is vested in the Sirdar and Governor General of the Sudan, in 1914 as in the previous year, Lieut. Gen. Sir Reginald Wingate, who also commands the detached body of the British Army of Occupation, stationed in the Sudan, quartered at Khartum. The British army force maintained in Egypt naturally underwent considerable change after the outbreak of the European War, and it was reported that the places of certain of the regular troops had been taken by colonials and volunteers. There was, at the end of the year, no positive information as to the number and nature of the troops.

GOVERNMENT. Dec. 17, 1914, the Foreign Office issued the following statement: "In view of the state of war arising out of the action of Turkey, Egypt is placed under the protection of his Britannic Majesty, and will henceforth constitute a British protectorate. The suzerainty of Turkey is thus terminated. His Majesty's government will adopt all the measures necessary for the defense of Egypt and the protection of its inhabitants and interests. The King has been pleased to approve the appointment of Col. Sir Arthur Henry McMahon, who has been Foreign Secretary to the government of India since 1911, as his Majesty's High Commissioner of Egypt."

A new ruler was chosen to succeed Abbas (II) Hilmi in the person of his father's brother, Hussein Kemal Pashy, with the revived title of Sultan of Egypt. To him King George sent, Dec. 19, 1914, the following message: "Your Highness has been called to undertake the responsibilities of your high office at a grave crisis in the national life of Egypt. I am convinced that

you will be able, with the coöperation of your Ministers and the protectorate of Great Britain, successfully to overcome all influences which are seeking to destroy the independence of Egypt, and the wealth, liberty, and happiness of its people."

By the establishment of the new protectorate Turkey loses nothing but prestige.

HISTORY

Among the birthday honors announced in June was an earldom for Lord Kitchener, betokening appreciation of his remarkable work in consolidating the British rule in Egypt. The constitutional reform of July 21, 1913, creating a more representative Legislative Assembly, was fully vindicated in 1914 by the work of the new Assembly, which held its first session from January 22 to June 17. Besides examining some 600 petitions, and formulating its own rules of procedure, it passed on the budget for 1914-15, and dispatched the Court of Criminal Appeal Bill, the Coöperative Agricultural Syndicates Bill, the Weights and Measures Bill, the Provincial Marshes and Pools Bill, the Destruction of the Boll-worm Bill, the Creation of Higher Commercial Schools Bill, and other measures of sound practical statesmanship. Although the British authorities felt that, for the present at least, the Legislative Assembly should confine itself to advising the Ministry and criticising Bills, without presuming to discuss the fundamental organization of the government or to demand a responsible ministry; nevertheless the Assembly developed a strong opposition to the Said cabinet—so strong that Said, who was not especially in favor with the real authorities, felt obliged to resign on April 3. After Mustapha Fehmy Pasha had unsuccessfully attempted to form a new cabinet, Hussein Rushdi Pasha, former Minister of Justice, succeeded on April 5 in forming a cabinet as follows: Premier and Minister of the Interior, Hussein Rushdi Pasha; public works and war, Ismail Sirri Pasha; education, Ahmed Hilmi Pasha; finance, Yussuf Wahba Pasha; *Waqfs*, Mohammed Moheb Pasha; justice, Abdel Khalek Sarwat Pasha; foreign affairs, Abdi Yeghen Pasha; agriculture, Ismail Sidki Pasha.

On July 25 an attempt was made to assassinate the Khedive, who was returning in his automobile from a visit at the residence of the Turkish Grand Vizier in Constantinople, when a young student by the name of Mahmud Mazhar fired several pistol shots, wounding the Khedive in the right forearm and in the cheek, but inflicting no serious injury. The would-be assassin was shot dead on the spot by a gendarme. In November the Khedive, by associating himself with the Turkish military operations against Egypt, incurred the resentment of the British government and was superseded by his uncle, Hussein Kemal, who assumed the title of Sultan. On August 6 a Khedivial decree was issued putting Egypt in a state of war and under the protection of Great Britain, as a consequence of Great Britain's participation in the War of the Nations. While the local German journal, *Die Aegyptische Nachrichten*, was immediately suspended, the German and Austro-Hungarian consular representatives in Cairo were allowed to remain, under the protection of the Capitulations, until in September they were re-

quested by the military authorities—so it was popularly believed—to leave the country. The feeling in Egypt, as represented by the native newspapers, especially in the cities, was at first distinctly favorable to Germany; but as the lines of the press censorship were drawn more closely, and after some 40,000 British and Indian troops had arrived (about September 9), there were few public expressions of anything but loyalty to British rule. The November session of the Legislative Assembly, which might have afforded an opportunity for disloyal agitation, was postponed from Nov. 1, 1914, to Jan. 1, 1915. In order that economic disturbances might not complicate the situation, the British government guaranteed a loan of \$25,000,000, to be issued by the Egyptian government in the form of London Treasury Bills, for the provision of sufficient currency to finance the cotton crop.

As noted above, under *Government*, Egypt was declared a British protectorate on December 17, and on the following day the reigning Khedive, Abbas Hilmi, was deposed and Prince Hussein Kemal, uncle of Abbas Hilmi, and eldest living prince of the family of Mehmet Ali, was appointed "Sultan of Egypt." The nomination of Hussein to succeed his nephew was clearly a violation of the *firman* or law of June 12, 1866, whereby the succession to the Khedivial throne had been made direct from father to son; but apparently the British government considered that the war, and the transformation of the Khedivate into a Sultanate, had rendered it no longer necessary to observe this constitutional provision, and felt no compunction in setting aside the 15-year-old son of Abbas Hilmi, Prince Mohammed Abdul Mouneim, who had hitherto been recognized as the heir-apparent to the throne of Egypt. Hussein Kemal, it may be observed, is a man over 60 years of age, experienced in administrative functions, and educated in the Paris of the Second Empire.

The British protectorate over Egypt was promptly recognized by France, Great Britain in return recognizing the Franco-Moroccan Treaty of 1912. Italian opinion appeared on the whole to sanction the British decision also.

The effect of the war felt by the Egyptian railways was the necessity for increased economy and on the 7th of August the State railways diminished their service, withdrawing the Cairo-Alexandria expresses, two each way, and also the night service in each direction between these cities, and six of the main-line trains on the Upper Egypt section. The service of the Cairo-Matara suburban line was reduced one-third, and the lights at the Cairo main station were ordered extinguished at 8 P. M., while the other stations were not lighted at all.

ELARSON. A new arsenic derivative combined with chlorine, its chemical designation being chlorarsenobenhenolic acid. It contains about 13 per cent of elementary arsenic and 6 per cent of chlorine. The drug has the therapeutic qualities of arsenic, but is said to be much better utilized in the system and therefore effective in smaller doses than other arsenical preparations, and also possesses the advantage of being relatively free from irritating action on the stomach and intestines. Elarson is indicated in the various anemias such as chlorosis, in many skin diseases, chorea, and in fact wherever arsenic is indicated. The sub-

stance occurs as a whitish, amorphous, tasteless powder, insoluble in water, slightly soluble in alcohol and ether.

ELECTION LAWS. See **ELECTORAL REFORM.**

ELECTION OF SENATORS, DIRECT. See **ELECTORAL REFORM.**

ELECTORAL REFORM. Under the following topics, some of the most important changes and reforms in electoral procedure and laws in the United States are mentioned and listed.

INITIATIVE AND REFERENDUM. Amendments to State constitutions providing for either partial or general initiation and referendum in legislation were submitted to the voters of South Dakota and Wisconsin. In the former State, the proposed change was limited in its application to school laws and was adopted; in the latter, it was operative with reference to general legislation and was defeated. Conspicuous instances of the employment of the referendum occurred in Massachusetts, California, Washington, and Missouri. In Massachusetts, the voters abolished the requirement of party enrollment for primary elections; those of California registered their opposition to the prize fight law; and those of Missouri rejected the full crew law enacted by the Legislature.

RECALL. An amendment to the State constitution granting to the voters the power of recalling elective officers, including judges, was adopted in Kansas. In Louisiana, the amendment providing for the recall of officers other than judges was accepted, but the proposition to recall judges was defeated. As a part of the proposed amendment relative to the initiative and referendum, the voters of Wisconsin decided against the recall.

POPULAR ELECTION OF UNITED STATES SENATORS. In 1914 there occurred the first general election in which the Seventeenth Amendment to the Constitution was operative in all of the States in which United States Senators were to be elected. In twenty-eight of the States, these elections were held with machinery erected, and suffrage qualifications imposed, by State laws, or that created by the special law of Congress to cover cases where the States had not at that time made proper provision.

WOMAN SUFFRAGE. Amendments contemplating the extension of the suffrage to women were submitted in the following States: Nevada, Montana, North and South Dakota, Nebraska, Missouri, and Ohio. Long and actively contested campaigns were conducted in each of these States for and against these amendments, and, in only two of the seven, Nevada and Montana, were they adopted. See **WOMAN SUFFRAGE.**

ELECTION LAWS. In the State of New York, the Assembly, under the urgency of Governor Glynn, enacted a law providing for the direct nomination of party candidates for public office. The election laws of New York were also amended by three bills passed in 1914: the Duhamel bill provided for additional sample ballots and instructions for the voter on registration and election days; the Foley bill permitted women to be present as watchers when the woman suffrage amendment to the State constitution should be voted upon; the most important of the three, the Blauvelt bill, contained provisions to perfect the laws for voting under the Massachusetts ballot, to provide for a square instead of the long ballot, and to require more promptness in the counting of the

votes. The last bill reduced the number of voters requisite for an election district from 500 to 350 in New York City, and to 300 elsewhere. The ostensible purpose of this legislation was to render the booths less crowded and more accessible to the voter. Possibly the most important of these amendments was that providing that the nominations of party candidates for municipal officers, which were to be filled at elections held at a different time from general elections, should be made in the manner prescribed for nominations for all offices to be filled at those general elections, that is, by primaries, except in that these primaries should not be held coincident with the fall primaries and should be unofficial in character. This legislation was sharply criticised on account of the vagueness of the definitions made of the various qualifications for voting, and on account of the fact that it gave the alleged corrupt political organizations undue advantages. The primary election laws of Massachusetts were amended in that the requirement of enrollment in some one of the incorporated political parties before participation in the election was abolished.

ELECTRICAL ENGINEERING. See **ELECTRIC POWER, TRANSMISSION OF; ELECTRIC RAILWAYS; RAILWAYS; WIRELESS TELEGRAPHY AND TELEPHONY; ETC.**

ELECTRICAL INDUSTRIES. The development of hydroelectric plants was especially restricted during the year on account of the prevailing business depression following the outbreak of the European War, and because there were many plans for legislation, both at Washington and in the various State capitals, looking toward the control of water-power sites. At the close of the year little had been accomplished in this direction, however, though agitation of the question of restricting private ownership served to restrain promoters from undertaking new enterprises and alienated the interest of the investing public in propositions of this sort. The most important of the measures referred to was the so-called Adamson Water Power bill, on which the Senate was holding hearings at the end of the year. This bill embodied certain regulations under which the National government might lease power sites on navigable waters. It was passed by the House on August 4. The Ferris bill, covering the use of water powers on public lands, was also before the Senate.

The use of electric power in the various industries was extended during the year at only a moderate rate on account of the general depression in business and the outbreak of the European War. An increasing amount of energy was arranged for in the iron and steel industries, where the operation of electric arc furnaces was found to give satisfactory and economical results in steel making, particularly for rails. In rolling mills there was a substitution in several instances of electric motors for steam engines, as the former were found to be equally suited to the enormous fluctuations of load, when applied to work of this kind and to involve lower costs for repairs and more economical power consumption. At Witherbee, Sherman & Co.'s iron mine at Mineville, N. Y., with an annual output of more than 700,000 tons of ore, magnetic separation was employed with striking success. Electric power was of course applied for hoisting from a 900-foot shaft; and

the magnetic method of concentration which was applied to about four-fifths of the output was reported to be giving excellent results, even when it is realized that the ore from this particular group of mines was variable in the amount of iron contained, the proportion of the latter ranging from 25 to 55 per cent. A brick-making plant in Illinois, with an annual output of 50,000,000 bricks, substituted electric motors for steam engines, with a total installation of about 1000 horsepower. Careful tests showed that the amount of power consumed per 1000 bricks turned out was about 13 kilowatt hours.

Exports of electrical machinery, appliances, and instruments from the United States during the fiscal year ended June 30, 1914, reached a total of \$25,060,844, a decrease of \$1,711,972 from the figures for 1913.

There was a noteworthy increase in the number of electrically-propelled vehicles in use, and a constantly increasing use of electric power for domestic uses, such as for cooking, washing, ironing, and the operation of motors for vacuum-cleaners, pumps, and sewing machines.

The electro-chemical industries, though restricted to moderate activity by the European War, showed satisfactory progress in the quality and novelty of products turned out. In Norway, the further development of cheap hydro-electric power was resulting in the production of new records for efficiency in the fixation of atmospheric nitrogen and the manufacture of other useful substances.

The following table, from figures compiled by a well-known authority, represents the change in gross earnings of the various lines of electrical industry from 1913 to 1914.

	1913	1914
Electrical manufactures \$	875,000,000	450,000,000
Electric railways	650,000,000	730,000,000
Central stations	450,000,000	400,000,000
Telephone service	350,000,000	850,000,000
Telegraph service	85,000,000	85,000,000
Isolated plant service...	125,000,000	125,000,000
Miscellaneous	125,000,000	125,000,000
	\$2,160,000,000	\$2,265,000,000

ELECTRIC BATTERIES. Large generating stations in 1914 continued the introduction of storage batteries for absorbing the surplus power of the generating units during the hours of light load and for assisting them at the peak or periods of maximum demand upon the station. Such installations were of course confined to the largest stations, although many isolated plants such as those in hotels and department stores found the use of a storage battery in connection with the generating plant an efficient aid to uniform operation.

The success of storage-battery street cars on the cross-town and belt lines in New York City during the year led the management of these lines to decide upon the replacement of all horse-cars, a small number of which were still in use during the year. The lines mentioned were those not already equipped with the slot conductor system. A considerable use of the storage battery was made for the propulsion of cars on some of the steam railways in Europe. In Germany, shortly before the outbreak of the war, it had been announced that there were 176 such cars, operating on 4000 miles of line and representing an investment of \$3,000,000. These

used lead storage cells, and were run as single units on branch lines and in other localities where traffic was light.

As referred to in the 1913 YEAR BOOK, electric storage-battery trucks for moving freight in railroad freight houses and on steamship piers were increasingly used; while in large passenger stations they had almost entirely supplanted hand-operated trucks for baggage and express matter. At the close of the year, the Pennsylvania Railroad was trying out a combination passenger and baggage car equipped with Edison storage batteries and having four 20-horsepower motors. It was used in regular service on a 4-mile branch line with a view to the general introduction of such cars on other branches of the road.

A primary battery was invented by Dr. E. Bellini and placed on the market in Europe during the year. It used plates of lead amalgam and carbon in an acid solution, consisting of 8 parts sulphuric and 12 of nitric acid in 100 parts of water. The negative plates were made in the proportion of 10 parts mercury and 90 parts lead by weight. One of the characteristics of the battery which gives it a large capacity is that of making it with four positive and three negative plates with a total area of 900 square centimeters, which reduced the internal resistance to 0.022 ohms. It was found possible to secure a discharge capacity of 112.5 ampere hours, the output then being sharply diminished by the exhaustion of the acid. The low electromotive force, only 0.11 volt, necessarily restricted the application of such a cell to special uses.

ELECTRIC FURNACES. See METALLURGY.
ELECTRIC GENERATORS AND MOTORS. See DYNAMO ELECTRIC MACHINERY.

ELECTRIC LIGHT AND POWER. See MUNICIPAL OWNERSHIP.

ELECTRIC LIGHTING. The nitrogen-filled tungsten lamp, first brought out in 1913, was developed in 1914 to a point of wide commercial application, and improvements in efficiency and durability were announced. The energy consumption of such lamps was steadily reduced by improvements in manufacture and selection of materials, so that the 1000-candle power series lamp using 20 amperes current operated at 0.63 watts per mean spherical candle power and the 32-candle power series lamp using 7.5 amperes operated at 1.25 watts. In the multiple type the average specified consumption had reached a value of 0.72 watts per candle power for the 1000-watt size and 1.08 watts for the 200-watt size. The average increase of efficiency over lamps of the same kind available at the end of 1913 was about 40 per cent. The gas-filled lamp was making great headway especially in displacing the vacuum type of tungsten lamp for small street lights and arc lamps in large cities. A noteworthy competitor of this lamp was an improved magnetic flame-arc lamp, whose high efficiency was due to better selection of materials for the core of the carbon, as well as the method adopted for concentrating and diffusing the radiation.

The gas-filled tungsten lamp achieved a wide success both in the United States and Europe, its use, however, being restricted to large public places and outside situations, as units small enough to be suitable for domestic interior illumination had not come into extensive use.

An attempt was made to adapt the lamp for domestic use, but without much success. It was the opinion of engineers that an atmosphere of mercury vapor would be better than nitrogen for use in lamps with small filaments, on account of the well-known increase of radiation of greatest brightness, which moves towards the violet end of the spectrum in proportion as the temperature of a radiating body is increased. New York, Chicago, and other large cities were installing large numbers of nitrogen tungsten lamps for street illumination to replace one or more of the various types of arc lamps that had been in use. It was confidently expected that the satisfactory results achieved in a few months' service would lead to their further introduction.

Another use for the gas-filled lamps was the illumination of photographic studios, especially those making moving pictures. The color of its light caused it to be preferred to that of the mercury vapor lamp commonly used for such purposes.

The United States navy was testing in service a novel type of searchlight lamp, in which the carbon electrodes were surrounded with burning alcohol vapor, whose temperature, being lower than that of the carbon electrodes in the arc, served to cool the latter and lessen their consumption. Owing to their operation at a lower temperature the efficiency of the arc was not only increased, but the arc was confined to a smaller space, thus simplifying accurate focusing with the reflector. In tests the new lamp showed about six times the intensity of the ordinary arc, using the same reflector, and with the same energy consumption. A further advantage in the use of alcohol vapor surrounding the electrodes was that a much greater current density can be used without excessive burning of the carbons, and consequently a brighter light produced, in addition to which, smaller carbons were used than were found necessary in the ordinary arc lamp.

Another type of searchlight that was under investigation by the Navy Department had a gold-plated reflector, developed by a French inventor, that was said to possess many advantages over the silver-plated reflector commonly used, as the gold surface was not corroded by the action of deposits from the carbons, nor was it so susceptible to atmospheric conditions and the destructive effects of smoke and gases resulting from gun fire in its immediate vicinity. Owing to the slightly greater reflecting power attained by the gold mirror it was possible to attain a greater brilliancy of illumination of objects at a distance than with the kind formerly in use.

It was reported by the Committee on Incandescent Lamps at the 1914 Convention of Edison Illuminating Companies that 100,000,000 tungsten lamps were manufactured annually in the United States, and 3,000,000 annually imported (up to the last date that such figures were available). The report drew attention to the fact that in 1907, the year they were first introduced on a commercial scale, the average life of such lamps was only 300 hours. The life had been increased to a figure somewhat beyond 1000 hours in lamps turned out at the end of the year. It was stated that the 200- and 300-watt hour sizes operate at an energy consumption of 0.75 watt per candle power.

The report, in treating the subject of arc lamps, mentioned the improvements that were made during the past year in the magnetite lamps by changes in the arrangement and position of the electrodes, as well as improved double globes for directing the radiations. These improvements have increased the efficiency of this type of arc lamp by 30 per cent.

The Illuminating Engineering Society continued its well-known activities during the year and published much valuable data on the subjects of gas-filled tungsten lamps, the measurement of glare from reflecting surfaces, the best kind of light for the eyes, and efforts for obtaining an equality to daylight by artificial illumination.

ELECTRIC POWER, TRANSMISSION OF.

During 1914 several high tension systems were completed, and began supplying energy. While most large central stations outside of those in the principal cities were hydroelectric, there were a number in various parts of the world entirely steam-driven, that were important not only for the actual amount of energy output, but also the distance to which the latter was transmitted. The tendency in the design of transmission circuits was constantly to a higher operating voltage, and at the close of the year there were more than 35 stations in various parts of the world having a total developed capacity of 1,800,000 kilowatts, which was transmitted at 100,000 volts and over, the maximum pressure employed being 150,000 volts. Among the longest transmissions over a single line there may be mentioned that from Niagara Falls to Windsor, Ontario, 250 miles, and at least two in California, transmitting 240 miles. While certain systems were supplying energy over distances varying from 400 to 1000 miles, these were in effect networks of lines, supplied from widely separated generating stations of the system. The Mississippi River hydroelectric development at Keokuk, Iowa, that began transmitting energy to St. Louis, as mentioned in the 1913 YEAR BOOK, extended its lines during 1914, in order to reach several large manufacturing and mining centres. One of the latter circuits was said to have the largest single load transmitted from any power plant, namely 4000 horsepower, to the cement works at Continental, Mo. In central Texas, two large steam stations were distributing energy at 60,000 volts, to a number of widely scattered cities and towns over lines totaling more than 240 miles.

In the northern part of Chile a transmission line was building to furnish energy generated by a steam station at Tocopilla on the Pacific, to the copper mines 87 miles inland and at an elevation of almost 10,000 feet above sea level. The line voltage was to be 110,000 volts, which would be reduced by transformers at the mines for the operation of machinery and for the electrolytic treatment of the low-grade copper ores found in that locality.

Engineering practice had become settled in regard to standards of construction. For all lines operating at 100,000 volts and over suspension type insulators were universally employed; and for conductors, either stranded copper or steel-cored aluminum cables were used. While a few transmission lines were built with wood poles, by far the greater number were supported on steel poles having a height of from 50 to 75 feet, according to the nature of the

country traversed, and placed so as to give about 600 feet span for the conductors.

At Burrard Inlet, British Columbia, a transmission line having an unusually long span was built to carry electric energy across the inlet to North Vancouver. The line was of stranded galvanized steel wire, operated at 34,600 volts, and was supported by two wooden towers at each end with a span of 951 feet. The towers were 210 feet in height. The inlet being navigable, it was necessary to maintain the wires not less than 160 feet above high water.

ELECTRIC RAILWAYS. The year 1914 witnessed several important developments in the application of electricity to the propulsion of railway trains. In the United States there was noticeable a tendency toward increasingly higher voltages for direct-current railway operation, while in Europe a small amount of direct-current work for heavy railways was under way, the weight of engineering opinion was strongly in favor of alternating current at from 11,000 to 15,000 volts and at the comparatively low frequency of 15 cycles per second. The 3-phase alternating current system appeared to enjoy but little favor except for municipal and other light railways. The New York, New Haven & Hartford extended its overhead lines an additional 40 miles to New Haven, Conn., and was

the Canadian Northern Railway, at the close of the year, was being equipped for a direct-current overhead electric system operated at 2400 volts. The installation in addition to the 3-mile length of the tunnel was to be carried a distance of more than 5 miles outside to reach the new terminal and storage yards. The Canadian Pacific Railway was considering plans for the electric operation of the double-track Selkirk Tunnel, $5\frac{1}{2}$ miles long, in British Columbia, but at the close of the year details of the installation had not been arranged. At Philadelphia, the Pennsylvania Railroad had nearly completed the work mentioned in the 1913 YEAR BOOK, of installing an overhead conductor for the electric operation of suburban trains, comprising 30 miles of line. The Norfolk and Western Railway was about to put in use a number of electric locomotives, built by the Westinghouse Company, for use in hauling 3200-ton coal trains over a mountain division in West Virginia having 2 per cent grades. These locomotives were the largest and most powerful ever built, the double units having a total tractive force of 170,000 pounds. They were designed with split-phase induction motors for alternating current supplied from an overhead conductor at 11,000 volts.

One of the most important announcements of

THREE THOUSAND-VOLT DIRECT CURRENT LOCOMOTIVE DESIGNED FOR CHICAGO, MILWAUKEE, AND ST. PAUL RAILWAY.

operating about one-half of its passenger and freight traffic on that part of the road by means of electric locomotives. In connection with this extension it was found desirable, owing to many complaints of inductive interference with telegraph and telephone circuits, to change the system of supplying energy to the 11,000-volt overhead wire. By installing what were known as split-phase transformers and supplying one terminal of these from feedwires at a pressure of 22,000 volts, the distribution of current over the lines between the power house and the locomotives was altered to such a degree as to greatly improve the conditions formerly complained of. The overhead conductor being connected to the middle point of the phase-splitting transformers, was, as formerly, operated at 11,000 volts, making it unnecessary to introduce any change on the locomotives, but so affecting the resultant currents in the trolley wire as to produce the desired result.

The results of the first year's operation of the Butte, Anaconda, and Pacific Railway by electric locomotives was very satisfactory. Complete substitution of steam locomotives by electric resulted in a saving of more than 25 per cent in locomotive repairs and nearly 40 per cent in round house expenses. Electric operation made it possible to run 25 per cent fewer trains, while hauling 35 per cent more tonnage than when steam locomotives were employed. At Montreal, the Mount Royal Tunnel under construction by

the year was the contract made by the Chicago, Milwaukee, and St. Paul with the General Electric Company for the electrification of 113 miles of the former's main line between Three Forks, Idaho, and Deer Lodge, Mont., involving the expenditure of about \$3,500,000. Locomotives to operate with 3000-volt direct current were in course of construction, and it was expected that the whole work would be finished within one year. In Switzerland the government decided to ultimately replace all steam locomotives with alternating-current electric locomotives. The work was to be spread over several years and one of the most difficult lines to operate by steam, the St. Gothard, was undertaken first. In Norway, the Riksgränsen Railway, about 87 miles in length, was equipped with electric locomotives. The capacity of this, the most northerly railway in the world, was greatly increased by the change, and the transportation of iron ore, which constituted its principal traffic, was correspondingly diminished in cost. Fifteen thousand volt alternating current was employed for the locomotives. See also RAILWAYS, *Electrification*.

ELECTRIFICATION OF RAILWAYS. See ELECTRIC RAILWAYS and RAILWAYS.

ELECTROMETALLURGY. See CHEMISTRY, INDUSTRIAL.

ELECTRONS. See PHYSICS.

ELEVATORS. During the year 1914 an ordinance designed to reduce elevator accidents

ELECTRIC LOCOMOTIVE

WESTINGHOUSE ARTICULATED ELECTRIC LOCOMOTIVE FOR FREIGHT SERVICE ON NORFOLK AND WESTERN RAILWAY

TWO OF THE 135-TON UNITS SHOWN ABOVE CAN HAUL A TRAIN OF 45 LOADED COAL CARS WEIGHING 3250 TONS. ALTERNATING CURRENT AT 11,000 VOLTS IS SUPPLIED TO A SPLIT-PHASE SYSTEM WITH INDUCTION MOTORS OF 1600 HORSE POWER CAPACITY IN EACH UNIT

1750

was passed in New York City, to be put into force on Jan. 1, 1915. It provided for an interlocking device on every elevator, and made it unlawful to operate any elevator otherwise. Elevators traveling 16 stories or more were to be equipped before Oct. 1, 1915, and it was estimated that there were about 150 buildings in Manhattan, which were of this or greater height. This ordinance came as a result of the large number of fatal accidents occurring at elevator gates, 207 being recorded in the five years from 1907 to 1911, of which 119 were on passenger elevators and 88 on freight elevators. The new ordinance required the entire interlocking of elevator cars and shaft doors, so that no shaft gate or door can be opened until the elevator has come to a stop and the car cannot be moved while the door is open. In the Borough of Manhattan alone there were some 10,000 elevators, with an aggregate of about 100,000 openings; this and additional provisions in the way of regulations and inspection should add materially to the safety of the traveling public.

EMPIS, ADOLPHE GEORGES GASPARD JOSEPH, called *SIMONIS*. A French physician and medical author, died in Paris in the early part of December, 1914. He was born in 1824. Early in his medical practice he published many clinical studies on diphtheria, irregular varioles, and other diseases; and in 1865 he won distinction by a work in which he described a clinical picture of acute military tuberculosis. In 1867 he published a book on the statistics of the obstetric services of the Hôpital de la Pitié and the means there taken to prevent puerperal fever. These books made prominent for the first time the problem of the contagiousness of puerperal fever, affirmed the necessity of isolating the patient so affected, and of using strict preventive measures against the disease. Empis was one of the last representatives of the French clinical school which became prominent about 1850. He was at one time agrégé of the Faculté de Médecine de Paris, and in 1895 was president of the Académie de Médecine.

EMPLOYERS' LIABILITY. Until a few years ago one of the most important phases of labor legislation dealt with employers' liability for accidents during working hours. The main characteristic of the voluminous employers' liability legislation was the gradual reduction of the common-law defenses behind which the employers had been able to shield themselves. Under the common law the employee was held to have assumed the normal risk of his employment; in case of accident due in part to his own negligence, he could not recover damages for injury; if a fellow workman was responsible for the accident causing injury or death the employer was relieved from financial obligation. Although employers' liability legislation gradually removed these defenses for the most part, nevertheless experience showed that the vast majority of working men injured in industry received no financial recompense. This was mainly

due to the lack of means to carry on necessary litigation through a series of courts; but was due in part to the fact that employers transferred their responsibility to employers' liability insurance companies. Following the lead of England, therefore, 24 American States have enacted laws providing some means of definite compensation for injuries or deaths resulting from accidents to men at work without the necessity of resorting to court procedure. (See *WORKMEN'S COMPENSATION*.)

The only general liability laws enacted in 1914 were those of Alaska and Mississippi. Alaska provided that every employer in a business carried on by machinery should be liable for all damages to employees resulting from officers, agents, or other employees, or resulting from defect or insufficiency in machinery. The contributory negligence of the injured was declared not a bar to recovery of damages by him when his negligence was comparatively slight. Moreover, these new liabilities of employers could not be waived by any contract, insurance, relief benefit, or indemnity. Mississippi abolished the assumption of risks doctrine, except for conductors and locomotive engineers when in charge of unsafe cars or engines voluntarily operated by them.

ENGINEERING. Engineering activity and progress in 1914 was influenced in no small degree by the two factors which predominated all human activity in that year, namely, the financial depression extending throughout the world and the great European War, which began in August. As a result, few important new projects were undertaken, while those under way, especially in Europe, were postponed, or carried on in a desultory fashion with the idea of providing employment rather than the ultimate completion of the work, unless it had some military importance. A number of the more important works will be found treated through the *YEAR BOOK* under different heads. The reader will find discussed under *BRIDGES* two important structures building in America, but little of importance elsewhere in the world. Under *CANALS* and the *PANAMA CANAL* the completion of important engineering works are treated, while the articles, *AQUEDUCTS*, *WATER SUPPLY*, *WATER PURIFICATION*, and *WATERWORKS* discuss progress in these fields, and especially the approaching completion of the great Catskill Aqueduct Water Supply. Some notable *DAMS* were building during 1914, while there were also important *DOCK AND HARBOR* works under construction, though naturally European work was seriously interfered with. Under *RAILWAYS* is recorded the curtailment in construction, and the general depression, which extended into engineering from finance and operation.

There was, however, notable *TUNNEL* construction in progress during the year in both continents, while rapid transit, ever demanded by the inhabitants of large cities, exhibited further progress both in Europe and the United States by the construction and extension of subway systems. More than ever *MUNICIPAL GOVERNMENT* was under discussion and the contributions of engineers to the efficient operation

of cities and the conduct of their activities, was appreciated and discussed, as the city manager and commission forms of government depended in large part on trained municipal engineers to carry on the work. In this connection the students of municipal engineering will be interested in the work in GARBAGE AND REFUSE DISPOSAL and SEWAGE, while the various schemes for improving the FIRE PROTECTION of American cities and doing away with the deplorable wastes annually recorded in the United States and Canada merits the discussion it receives. In ELECTRICAL ENGINEERING the year showed progress rather than startling innovations. ELECTRIC RAILWAY development, DYNAMO-ELECTRIC MACHINERY, ELECTRIC LIGHTING, and TRANSMISSION OF POWER BY ELECTRICITY, all had achievements to their credit, though here as elsewhere financial conditions interfered with general progress. In mechanical engineering the further advance of the INTERNAL COMBUSTION ENGINE may be recorded, though BOILERS, the STEAM ENGINE, and STEAM TURBINE cannot be neglected, for here also were important advances. PUMPING MACHINERY involved the construction of some new large units, while marine engineering, as discussed under BATTLESHIPS, SAFETY AT SEA, and SHIPBUILDING also is entitled to a share in the record of the year. The great war brought about new problems in WIRELESS TELEGRAPHY AND TELEPHONY as well as the scientific development of this art, while in military engineering the great minds of the continent of Europe were directed towards problems, the solution of which is indicated under MILITARY PROGRESS. Likewise on the sea the war produced a number of lessons for the naval engineer, and under NAVAL PROGRESS, and especially in the discussion under SUBMARINES important engineering matters are handled. In still another department of engineering, namely, AERONAUTICS, the war also had its effect in the latter half of the year, and this field was almost entirely given up to the use of aeroplanes and airships for the destruction of life and property, rather than their technical improvement. Thus this record, as outlined under the above and similar topics, while one of considerable progress, must be considered in the light of conditions rather than as one marked by unhampered achievement.

ENGLAND. See GREAT BRITAIN.

ENGLAND, CHURCH OF. The number of Church of England clergy in England and Wales in 1914 was, approximately, 23,000. Of these 14,750 were beneficed, and 7700 assistant curates. The revenues from church property, varying somewhat from year to year, total annually between £5,000,000 and £6,000,000. The grand total of voluntary offerings increases the church's income, roughly speaking, by between £7,000,000 and £8,000,000.

The outstanding matters of interest for 1914 centred in the discussions and deliberations that grew out of the so-called Kikuyu Controversy, which latter may be briefly summarized. The trouble arose from a conference of those representing missionary agencies—Church of England and also Nonconformist—in British East Africa; but it came to be a storm centre of conflicting opinions for the Church of England as a whole. The conference grew out of a conviction on the part of the participants of the necessity of presenting a united Christian front against heathenism and Mohammedanism, and,

after recognizing agreements in certain essential points of doctrine and coming to an agreement on certain points of federation, organization, and practical action, ended in a united communion service presided over by two Anglican bishops, Dr. Willis of Uganda and Dr. Peel of Mombasa, and held in the Scots Church at Kikuyu, near Nairobi, where, as a convenient central point the Conference met. The plans and agreements of the conference, with its doctrinal and disciplinary implications and its communicating of Nonconformists, outraged the convictions of the Bishop of Zanzibar, Dr. Weston, who expressed his views in an open letter to the Bishop of St. Albans, in which he lamented the distracted condition, doctrinally speaking, of the whole Anglican Church; condemned the Kikuyu proceedings as a peril to faith and doctrine; and virtually charged the Bishops of Uganda and Mombasa with schism, if not with heresy. This letter was a brand which kindled to flame the undying embers of hostility between the High, Low, and Broad parties in the Established Church, and, in a measure, in the whole Anglican communion. Dr. Gore, Bishop of Oxford, sided, in an open letter, with the Bishop of Zanzibar against the Kikuyu Episcopal conferees, while the liberal Modernistic views found lucid and vigorous expression in *Foundations: A Statement of Christian Belief in Terms of Modern Thought*, a volume of seven essays by seven Oxford men. The Archbishop of Canterbury finally referred the Kikuyu affair to a Consultative Committee, representative of the Church at home and abroad, which met in July to consider the questions of faith and order forced to the front by the East African incident. This committee had not, at the end of 1914, made its findings public.

ENTOMOLOGY. In the United States the usual amount of work was done in economic entomology, for which reference should be made to the publications of the various State Experiment Stations and to those of the Bureau of Entomology. The Federal appropriation for the bureau was \$829,420, of which \$310,000 was for the gypsy and brown-tail moth investigation. This latter investigation is being conducted along five general lines, experimental work; silvicultural work; quarantine; scouting; and coöperative. Under the latter is included the shipment of parasites to Nova Scotia and New Brunswick. A gypsy moth colony has been found near Cleveland, Ohio, and the brown-tail is reported to be extending its range to the southern part of Connecticut. Mosher and Webber reported that the gypsy moth seems to be changing its food plant, is much less hardy than when it first appeared in New England, and is much more susceptible to disease. A considerable portion of Eastern New England is quarantined against these two insects, and a force of inspectors examine all lumber products sent out.

One of the legionary ants, *Eciton schmitti*, was reported as attacking the Argentine ant below New Orleans, and may help to keep it in check. No remedy has yet been found for the cotton boll weevil. The potato beetle has reached the Pacific coast, and the San José scale was reported from Nova Scotia.

Morrill, experimenting on the attractiveness of various baits for house flies, found that sticky flypaper with a slice of ripe banana in the centre was as efficient as anything for catch-

ing flies. Ten per cent formalin is about the best poison, and if mixed with a little fresh beer its attractiveness will be increased. Formalin is of little use, however, if the flies have access to water elsewhere.

In 1913, the first Associations of Economic Entomologists ever formed in those countries were started in Germany and Russia.

EPIDESMINE. See MINERALOGY.

EPILEPSY. The increasing importance assigned to the pituitary gland in its relation to epilepsy was very evident during the year 1914. Out of a great number of investigations the results of examination in one series of 95 cases may be cited. Seven of these cases were found to be pituitary tumors, and in only one of these was there any other evidence of involvement of the pituitary gland aside from the epileptic attacks. Examination is made by means of X-ray photographs of the skull and the amount of involvement of the gland is estimated by changes in its bony bed. In these tumor cases there was no local osseous thickening at the base of the skull, rather a thinning of the body of the sphenoid or the clinoid processes from pressure was found almost constantly, indicating an enlargement of the gland. In some instances there were localized areas of thickening and in 15 cases no bony alterations were found. An analysis of the latter cases showed that the epilepsy was probably due to other causes. One was a case of internal hydrocephalus, another was a victim of paresis, and three patients had been epileptic from early childhood. Further studies seem to point to the conclusion that the frequency of attacks had a closer relation to the pathological bony changes than to the length of time the disease had existed. The investigators sum up their conclusions as follows: They found a condition of local acromegaly in essential epilepsy, which they believe can only be due to venous stasis. This stasis can only come in one way, namely, from pressure within the box-like structure that contains the pituitary gland. The evidence appears to be in favor of a crippling of this gland by pressure. Hypopituitarism would consequently be the result. It is known that epilepsy accompanies this condition. Therefore, it would appear that so-called idiopathic or essential epilepsy is due to mechanical injury of the pituitary gland. (See PITUITARY GLAND.)

Studies concerning the relation between epilepsy and tuberculosis were made by Shaw, who finds that the epileptic is considerably more likely to die of tuberculosis than the nonepileptic. An analysis of 100 deaths taken seriatim show that tuberculosis was the cause in 33 cases. A similar analysis of 290 deaths among nonepileptics showed 24.1 per cent due to tuberculosis, a difference of nearly 10 per cent. Shaw tested 60 epileptics with tuberculin and found that 50 reacted positively, whereas the nonepileptic in the same institution were 50 per cent positive. He also noted that the epileptics were peculiar in the depression of temperature which ensued after a comparatively small dose of tuberculin. It is contended by Shaw that epilepsy may be an evidence of tuberculous infection in childhood, affecting most probably the bronchial glands at first, and that the convulsions are due to either reflex irritation thus produced, or to the resulting toxemia acting on an unstable nervous system, whether inherited or

acquired. He contends further, that the recurring seizures not only establish a vicious habit in the nervous system, but also bring about autoinoculation with tuberculosis which tends to keep the tuberculous process in check; so that, instead of a fatal termination, we have epilepsy as a result. He advises a careful search for tuberculous foci in children as soon as epileptic fits develop.

Puncture of the corpus callosum had been practiced by a number of German surgeons in cases where intra-cranial pressure seems to exist. The object of this operation is to establish a connection between the cerebro-spinal fluid contained in the lateral ventricles with that circulating in the spinal canal and subdural spaces, thus equalizing pressure. This procedure has already been practiced in hydrocephalus and consists in trephining in a small opening in the vertex of the skull and thrusting a suitably bent trocar between the cerebral hemispheres until it passes through the corpus callosum. The brain is not injured and the operation does not entail nervous shock. It has even been done under local anesthesia.

The Connecticut State Colony for Epileptics was opened at Mansfield on May 15, 1914. The colony is located on the summit of a slope overlooking the Willimantic River, is 500 acres in extent, and will accommodate 80 patients. At present in 34 States (including the District of Columbia) epileptics are cared for in public and private hospitals, sanatoriums, institutions for incurables, pauper asylums, and homes. State hospitals or colonies established solely for the purpose of treating and caring for epileptics are nine in number, viz.: Connecticut, Indiana, Kansas, Massachusetts, New Jersey, New York, Ohio, Texas, and Virginia. Iowa was about to establish a model State colony at Woodward. Other State institutions in which epileptics were cared for existed in Michigan, Minnesota, Missouri, North Carolina, and Wyoming. The following States in 1914 had laws which wholly or in part prohibit the marriage of epileptics: Connecticut, Indiana, Kansas, Michigan, Minnesota, New Jersey, Ohio, Utah, and Washington. The twentieth annual report of the Craig colony for epileptics at Sonyea, N. Y., gives the daily average population during 1914 as 1434, with a net per capita cost for maintenance of \$169.43. During the year 96 patients were discharged and 144 died. Only four of those discharged had recovered from the disease. Since the opening of this colony in 1896, 56 cases have been discharged as recovered, 514 as improved, 635 as unimproved, and 1090 died. The total number treated was 3866.

EPISCOPAL CHURCH. See PROTESTANT EPISCOPAL CHURCH.

ERITREA. An Italian colony on the African coast of the Red Sea, extending from Cape Kasar on the north to the Strait of Babel-el-Mandeb on the south. The area is estimated at 45,800 square miles, and the population at 279,000. Asmara is the capital and Massaua the chief port. There is abundant pasture, and camels, oxen, sheep, and goats, and the products derived therefrom, are the main articles of trade. Salt is an important product for export to Abyssinia, where it serves as a monetary currency. Pearl fishing is carried on, and gold is mined near Asmara. The imports in 1911 were valued at 18,845,118 lire; exports 9,371,802;

transit 5,234,262. Tonnage entered, 191,101. There are 74 miles of railway. An extension to Keren and another to Agordat are under construction. The budget for 1912-13 balanced at 13,008,004 lire. The colony is administered by a governor.

ETHICS. See **PHILOSOPHY**.

ETHIOPIA. See **ABYSSINIA**.

ETHNOGRAPHY. See **ANTHROPOLOGY**.

ETHNOLOGY. See **ANTHROPOLOGY**.

EUGENICS. The art of improving the human race through better breeding advances in four ways: first, by reëxamination of partial or erroneous theories; second, by scientific discoveries in biology; third, by increase in knowledge of how to apply those discoveries; and fourth, by the popularization of information. During the past year progress has been made in all of these directions. Among scientists, at least, the former belief that the laws of heredity are relatively simple has been steadily undermined. Especially with reference to their application to man is it held that more knowledge of biological laws is needed. For example, certain discussions at the second annual meeting of the Eugenics Research Association held at Columbia University in June, 1914, brought out the fact that much more study of the mental traits of individuals and their modes of inheritance is desirable before any extensive practical programme is adopted. Tests for intelligence require closer standardization. Proof must be forthcoming as to whether in reality the unit characters found by Mendelians in physical traits occur also in the mental characteristics of man. With respect to these and many other scientific phases of the subject, investigators are becoming far more cautious than they were. As Dr. Saleeby remarks in a *Forum* article (April, 1914) on "The Progress of Eugenics": "Whilst we know much more than we did 10 or even 5 years ago, we know much less than we thought we did." Scientific investigation, however, is proceeding with vigor. One of the most interesting researches is that of Dr. Eastbrook in tracing the famous "Jukes" in all directions. He has already found some 2100 members of this famous family and a supplement to Dugdale's study of these people will probably soon appear. The Surgeon-General of the United States Public Health Service is a member of the Educational Committee of the American Genetic Association and is directing various studies of immigrants at Ellis Island from a eugenic standpoint. Mendelism has even been explained in the pages of the *Congressional Record*. Contributions to both scientific and popular phases of the subject have been appearing with great frequency. For example, the *Proceedings of the First National Conference on Race Betterment* held at Battle Creek, Mich., in January, 1914, contain several papers of scientific merit, as well as many of a more popular character on this subject. In March, 1914, the Galton Laboratory of the University of London issued an important report by Prof. Karl Pearson on *The Handicapping of the First Born*. In February the Eugenics Record Office at Cold Spring Harbor, L. I., published Bulletin No. 11, *A Reply to the Criticism of Recent American Work [in Eugenics]*, by C. B. Davenport and A. J. Rosanoff. Among recent books may be mentioned: H. E. Walter, *Genetics: An Introduction to the Study of Heredity* (New York,

1914); R. C. Prennett, *Mendelism* (revised and enlarged edition, ib., 1913); *Eugenics: Twelve University Lectures* (ib., 1914); Dr. H. H. Goddard, *Feeble-Mindedness: Its Causes and Consequences*; and F. G. Jewett, *The Next Generation: A Study in the Physiology of Inheritance* (ib., 1914), a book practically valuable for youthful students. Among magazine articles that of H. A. Miller in the April *Popular Science Monthly* on "The Psychological Limitations of Eugenics" is probably of most importance. An extensive bibliography—*Eugenics and Social Welfare*—has been published recently by the New York State Board of Charities (Albany). See **MARRIAGE AND DIVORCE**, *Eugenic Marriages*.

EVANGELICAL ASSOCIATION. A religious denomination having its greatest strength among the German-born citizens of the United States. Its doctrine is a modified Methodism. Communicants are found in nearly all parts of the northern section of the United States and Canada, but there is also considerable strength in the West and South. The denomination chiefly carries on missionary work among the Italian immigrants. In 1914 the body numbered 111,702 communicants, 1644 churches, and 1014 ministers. The church is divided for administrative purposes into 24 districts. In the Sunday schools there are about 175,000 pupils. The young people are organized into the Young People's Alliance, which numbered about 50,000. A publishing house is maintained in Cleveland, Ohio, and there are several philanthropic institutions and hospitals in Chicago, Philadelphia, and cities throughout the Middle West. The leading educational institution is Northwestern College, at Naperville, Ill.

EVOLUTION. See **CARNEGIE INSTITUTION**.

EXHIBITIONS, ART. See **PAINTING** and **SCULPTURE**.

EXPERIMENTAL PSYCHOLOGISTS, ASSOCIATION OF. See **PSYCHOLOGY**.

EXPLORATION. (For Arctic and Antarctic exploration, see **POLAR RESEARCH**.) Apart from the polar regions there have been during the past year no discoveries of unknown lands covering extended areas or of unusual popular interest. The comparatively small and steadily decreasing areas of unexplored regions lessen opportunities for important geographic additions through field-work. Explorative aims are materially and radically changing. The tendency is towards scientific surveying of regions illy known, of compilation and correlation of scattered data, and especially in the evolution of such phases of geographic knowledge as facilitate commercial exploitation, and favor colonial expansion. Of 16 memoirs of the British Association in 1913 only two covered regions hitherto unknown.

AFRICA. In this continent original discoveries are largely due to the operations of boundary commissions, which bring to light unknown native tribes, usually of minor importance, and furnish economic data as to fields of commercial value. Among fruitful acts of such commissions are the completion of the following boundary demarcations: The Anglo-French frontier from the Gulf of Guinea to the Niger; the Sierra Leone-French Guinea; the French-Kamerun, 1912-14, in the Tchad region; the Belgian Congo-Portuguese boundary; and the frontier between British Nigeria and the German Kam-

erun. While all of these commissions have contributed valuable data as to the fauna, flora, and natives of these regions, the last named, under Captain Nugent, covered the least known and most mountainous frontier of west Africa. The Benue River and its three great southern tributaries do not become navigable, even for canoes, until near the points where these streams cross the boundary into Nigeria. Nine-tenths of the zone of this boundary are occupied by the Dakka and Chamba pagans. A tiny, active folk, much resembling monkeys in appearance, they are usually in a state of nudity. They are agriculturists, live as independent communities in grass or mud huts, and are often at war. The French-Kamerun commission discovered in the luxuriant equatorial forest-belt Pahouine tribes, while to the north of the forest dwell the Bagas and Yangheres of whom almost nothing was known.

Of late geographic discoveries perhaps the most important is the absorption of the Uaso River by the Lorian swamp, ascertained by I. N. Dracopoli in his dangerous journey across the unknown parts of Jubaland to explore the mountains and lakes of the Dera region, British East Africa. G. F. Archer's journey along the frontier of Southern Abyssinia, to the southeast of Lake Rudolf, disclosed the crater lake of Marsabit, 4700 feet above the sea, with perpendicular walls of 300 feet. In the same region Capt. C. N. French ascended Mt. Kulai, which is rent in twain by a wonderful rift 300 feet across and 3000 feet deep. In the Libyan desert Harding King explored the extensive depression of Fara-fra, and the oases of Kairowin and Bu Munger, while Dr. E. Banse explored the regions adjacent to the oasis of Siwa. The Rohan-Chabot expedition returned in 1914 from its two years of exploration of Southeastern Angola and of the Kunene basin, Rhodesia. Most interesting was the discovery of the Kunene cataract where the upper river plunges 197 feet down a narrow gorge of granite. The expedition studied carefully the fauna, flora, and natives of the regions. African ethnology has received much attention in works by Bates on Eastern Libya, Rache on German East Africa, Tremearne on the Hansas, and Weeks on the Congo Bakongos. Unknown Morocco is being scientifically explored by France. Among others M. de Gironcourt is now investigating the agricultural possibilities in the regions around Mazagan, Safi, and Abda.

ASIA. As in recent years the activity of explorers has been largely applied to the unknown areas of the Tibetan and Mongolian highlands. The deserts of Central Asia, with their involved problems of geography and archaeology, are now being explored for the third time by Sir Aurel Stein. The extent of his geographic work is indicated by the recent completion of 94 maps by the Survey of India—each map of an area of one degree of latitude by one degree of longitude—of portions of Chinese Turkestan and Kansu. Equally important and successful have been his archaeological discoveries of treasures preserved for centuries by the sands of the Gobi desert, and covering the period from 50 B.C. to 900 A.D. Among other Asiatic relics he found about 2000 Chinese documents, relating to the local administration, history, literature, and social life. The translations by Chavannes (Oxford, 1913), accompanied by facsimiles of the more important originals, shed valuable light on

the past of central Asia. Stein's third journey (1914) furnishes similar results. Following an unexplored route through the Indus Kohistan, and across the Hindu Kush ranges, he reached the Lob Nor region. Through excavations of sand-buried villages, hitherto unknown, northeast of the terminal lagoons of the Tarim, interesting discoveries were made. From them Stein surmised that these settlements mark the route (later traced by him), over which the Chinese first established trade intercourse with central Asia and the distant West. Chinese records, on wood, show that as early as 120 B.C. a thriving silk trade began.

Among the loftiest peaks of Himalayan Karakoram, Dr. and Mrs. Workman, continuing their explorations, have disclosed unknown portions of the Siachen glacier and of its system, the greatest in Asia. They also discovered Mt. Queen Mary, 24,350 feet high. Dr. de Filippi explored the Remo glacier and adjacent portions of the Karakoram watershed. The glacial basin is of unexpected size and importance, while the watershed differs fundamentally from that shown on current maps. On the northeastern frontier of India work has progressed. Pritchard and Morsehead discovered immense gorges, with falls, on the Taron River, which proves to be a tributary of the Irawadi. Kingdon Ward crossed the Chungtien plateau to the upper reaches of the Kinsha Liang, where he obtained data as to the Lisu, the Lutz, and of the Kintsu dwarf natives which live near the sources of the river. A British expedition entered the Aha foothills, from Assam, where the Membas occupy hitherto unexplored regions. The source of the Bhareli River, farther northeast than now charted, is from snowy peaks over 23,000 feet high. Its valley is occupied by the Daphlas, probably the most numerous tribe on the frontier.

In western Asia material inroads have been made on the unknown regions of Central Arabia. M. Beneyton's surveys for a railway in Yemen, between Hodeida and Sanaa, discloses the country by a route that skirts the Serat range, via Tais, Yerim, and Dharmar. The axis of the Yemin plateau, from 4000 to 10,000 feet in elevation, is a continuous line of craters, favored by a mild climate. Crops grow by irrigation, as the rivers are essentially torrents which reach the sea in flood season only. Captain Leachman passed through parts of Central Arabia in a desert journey of 800 miles from Damascus to Ojair, on the Persian Gulf. His route was via the wells of Hazil and Leina, Kusaiba, Boreida, and Riadhl, the capital of Southern Arabia. He was not permitted to enter the great, unexplored southern desert. Captain Shakspear's route, in 1914, from Koweit, Persian Gulf, to Suez took him over an unknown country between Jauf el Amir and Boreida.

NORTH AMERICA. The demarcation of the Alaskan-Canadian boundary from Mt. St. Elias northward to the Arctic Ocean, along the 141st meridian of west longitude, is completed. This work, done by the Joint Boundary Commission, involved accurate surveys of regions not only unknown, but also of such ruggedness and remoteness as forbid their being traversed for other less important purposes. Geological and biological exploration, in coöperation with the demarcation, revealed forest areas of economic

value, while potential mineral resources are now made known. Especially interesting is the mapping of the vast ice-fields between St. Elias and Mt. Natazhat, first reported by the Duke of the Abruzzi. In continuance of its Alaskan work by the U. S. Geological Survey in 1914, engineers Sargent and P. S. Smith surveyed parts of the Kuskokwim watershed. They explored the region from Lake Clark westward to the Kuskokwim Valley, and examined the southwestern extension of the Alaskan range, covering a previously unknown territory about 150 miles wide. The survey through its engineer Bagley and geologist Chapin also explored the region between Copper River and the headwaters of the Susitna River. Starting from Knik they followed the Matanuska River to Chickaloon and thence northwest to the Susitna. Later they explored the region between the headwaters of the Matanuska and the Copper. The Canadian Geological Survey has in the field, under C. Camsill, an expedition to explore the fauna, flora, and native life in the unknown portions of the Athabasca region between Black Bay and Christie Bay, Great Slave Lake. Other field parties are exploring the continental divide, near the Alaskan boundary, and along the eastern edge of the St. Elias range.

SOUTH AMERICA. Dr. W. C. Farabee in a journey from the Amazon Valley to Georgetown, B. G., crossed and explored some of the least known districts on the borders of Brazil and Guiana. Among the natives were many tribes of the Arawak and Carib stock which had never before seen white men. The National Geographic Society-Yale University Peruvian expedition, 1914-15, has commenced a geographical exploration of the fauna, flora, glaciers, etc., of the Coderilla Vicamba, a snow-capped range of Southern Peru, and also of the archaeological history of adjacent regions.

The most notable exploration in South America in 1914 was done by a party headed by Theodore Roosevelt, in the navigation of a river—now called by the Brazilian government Rio Teodoro—of which far the greater part had never been visited. It proved to be an affluent of the Madeira, which in turn is a southern tributary of the Amazon, and is about 1500 kilometers in length. Although very tortuous, the general course of Rio Teodoro is due north from the 13th to the 6th parallel of south latitude, between the 60th and 61st meridians of west longitude. It runs through a rugged, densely wooded country, uninhabited by man and almost devoid of beasts. The voyage, interrupted by many portages, involved a journey of 750 kilometers, and lasted two months, from Feb. 27 to April 26, 1914. The great number of portages around unnavigable rapids, some thirty in all, with scarcity of game, limited food, fever conditions, and two casualties, made the journey not only one of exhausting hardships and of great privations, but also one of serious danger. While the stream was known as the Aripuanan for some 200 kilometers up from the mouth, the upper reaches of the Rio Teodoro for 1000 kilometers are a new discovery.

OCEANOGRAPHY Extended efforts are now being made in the exploration of the oceans of the world. Observations of the depths, currents, and winds are supplemented by scientific investigation of deep-sea conditions and marine life, especially of phenomena connected with the

breeding, growth, and migrations of edible fishes. The vast importance of this work led to the organization of a Permanent International Council, and the explorations of the Bureaus of the American Department of Commerce are wisely conducted along lines harmonious with the operations of other nations. In 1914 the U. S. Coast and Geodetic Survey, coöperating with the Bureau of Fisheries, began an oceanographic investigation on the eastern coasts of the United States. The cruise of the steamer *Bache* resulted in such collections of marine-life—especially of plankton, including leptocephali and larval fishes—and observations of their sea-environment, as throw much light on the biological and physical conditions in the Gulf Stream and in the western Atlantic, on which ultimately depends the prosperity of the great fishing industries of the eastern coasts of America. The most important hydrographical discovery was the existence in the Gulf Stream, between Cuba and the Great Bahama Bank, of two distinct oceanic rivers, superimposed one above the other, flowing in opposite directions and at about the same rate of speed.

Another economic exploration was the survey of the great oyster bars of the upper Chesapeake Bay, by the State of Maryland, through the coöperation of the U. S. Coast and Geodetic Survey and the Bureau of Fisheries. This was completed in the early part of 1914 by the publication by the Coast and Geodetic Survey of a summary with attached charts. The completion of this survey is of considerable economic importance, as it indicates how the undeveloped, State-owned oyster beds of more than 500,000 acres, having a present physical value of \$20,000,000, can be so increased by wise legislation and proper management that their ultimate value will be \$100,000,000. The failure of fish food products to proportionally increase with the population of the world makes of noteworthy importance such biological explorations.

The Bureau of Fisheries has continued its oceanic explorations of biological and physical conditions in relation to fish life. During 1914 such investigations have been pursued in Chesapeake Bay, off the coasts of Nova Scotia, New England, and of North Carolina, where important collections of larval fishes were made. Among late oceanic discoveries of importance made by that bureau may be mentioned in the Atlantic the extensive and productive banks of sea-scallops, extending southwestward from the east end of Long Island to the capes of Virginia, about thirty miles offshore. In the Pacific, off the coast of Oregon, were located hitherto unknown fishing banks, where a lucrative halibut fishery has already been established.

On the occupation of the Philippine Islands by the United States, large regions of the islands and vast areas of the adjacent seas were unexplored. The systematic survey of this archipelago, commenced in 1901 with active financial support of the Philippine government, has been unceasingly pursued by the U. S. Coast and Geodetic Survey. The results now appear on 130 navigational charts, covering about two-thirds of the unknown seas. The largest unsurveyed areas comprise the Sulu Sea and waters north of Luzon. The various Philippine surveying organizations, through their land explorations, are contributing much topographic and economic information. Supervised by Coast Survey offi-

NATIONS OF THE EAST"

cers, these notable additions to geographic knowledge are in course of publication by the Insular government in a series of maps.

GENERAL. In British Papua, Australasia, Judge Murray, in a journey of 530 miles up the Fly River, discovered a hostile, unknown native tribe wearing a rattan, cuirass-shaped armor, an effective defense against arrows. Around Lake Murray was another tribe which covered themselves with various brilliant pigments.

Cartography is no longer confined to the land and sea, but in a way has invaded the domain of the air. Among the many excellent aeronautical maps published in Europe, there may be mentioned as illustrative those of the Aéro Club of France. At present they have special importance for use in military operations. Each sheet includes an area of one degree each of latitude and longitude. Railways, woods, tramways, rivers, canals, etc., are shown by suitable colors and symbols. Objects of special form or prominence—such as heights, buildings, aerodromes, landing places, etc.—are clearly indicated.

The magnetic survey of the ocean steadily progresses under Prof. L. A. Bauer, Carnegie Institution. In the non-magnetic ship *Carnegie*, voyages of 111,000 miles have been made, covering all oceans except the Antarctic. While the errors in current charts of compass-directions are usually found not to exceed 2°, they ranged from 4° to 6° in the Indian Ocean.

The London Maritime Conference, realizing the serious dangers arising from a lack of definite knowledge of the polar ice-drifts in the North Atlantic, urged the establishment of a summer explorative and patrol service along and adjacent to the northern transatlantic steamer routes. In 1914 the U. S. Revenue Service by constant patrol investigated the character, quantity, and location of such fields and bergs, disseminating this and other maritime information by wireless to coast stations and to steamships en route.

EXPLOSIVES. See **CHEMISTRY, INDUSTRIAL.**

EXPOSITIONS. There were no expositions of importance held in the United States during the year 1914. Two expositions whose progress has been followed in previous volumes of the **NEW INTERNATIONAL YEAR BOOK**, and which will open in 1915 deserve mention.

INTERNATIONAL PANAMA-CALIFORNIA EXPOSITION. (See **YEAR BOOK**, 1911, p. 247; 1912, p. 216; and 1913, p. 236.) This exposition which will be held in San Diego, Cal., from Jan. 1, to Dec. 31, 1915, celebrates the completion of the Panama Canal. It occupies an area of 618 acres in Balboa Park, a public playground that borders on the business centre of San Diego. The Exposition grounds are entered over Puente del Cabrillo, a bridge 135 feet high and 900 feet long, that crosses a deep canyon and serves as an approach to the walled city in which the buildings are in the Spanish Colonial style of architecture, suggesting the Alhambra, the old Mexican cathedrals, and the older homes of the Moors. Towers and minarets, white walls, and red-tiled roofs rise through a profusion of plants, shrubs, palms, and flowers. A high wire fence, 4 miles long, covered with native flowering vines, surrounds the grounds.

On passing through the entrance arches, the California State Building, with its massive cathedral-like dome and tower, commands atten-

tion, while opposite is a Roman building in which are shown the valuable exhibits of ethnology and archaeology. Eight other buildings, each an exact replica of some historic palace of Spain or Spanish-America, with rounded arches and connecting colonnades, come next on the tree-lined Prado. They are devoted to the exhibits pertaining to home economy, arts and crafts, science and education, foreign arts, botany, commerce and industry, varied industries, and food products. Besides the foregoing there are special buildings containing the exhibits of Sacramento Valley, San Diego County, San Joaquin Valley, and Southern California counties; also the following State buildings: Arizona, Colorado, Kansas, Ohio, Nevada, New Mexico, Utah, and Washington, as well as one for the exhibits from Brazil.

The amusement features are grouped along a narrow street called the Isthmus on which there are 60 buildings. Beyond these in the extreme northeastern end of the grounds is the "Painted Desert," a reservation of six acres surrounded by an adobe wall and cedar stockade. The space inside consists of an open plain divided by a high mesa on which are cliff dwellings, while in the foreground the Pueblo Indians have their homes, and in the background are the wandering tribes. The entire rock formation is colored like the real Painted Desert in Arizona. The industries of the southwestern aborigines, such as pottery-making, blanket-weaving, making of silver ornaments, and other home occupations of the Indians may be seen in active operation. The principal exhibits in this Exposition are those pertaining to the archaeology, ethnology, and natural history (especially botany), of the southwestern part of the United States.

PANAMA-PACIFIC INTERNATIONAL EXPOSITION. (See **YEAR BOOK**, 1912, p. 216; and 1913, p. 236.) This exposition, which will be held in San Francisco, Cal., from Feb. 20, to Dec. 4, 1915, celebrates the opening of the Panama Canal. It covers an area of 625 acres on Harbor View, a tract of land 2 miles long on the south front of San Francisco Bay, just inside of the Golden Gate and within fifteen minutes' street-car ride from the centre of the city. The main buildings, eleven in number, are in the Spanish Colonial or Mission style of architecture, and are grouped around a central Court of the Sun and Stars, one of the most magnificent features of the Exposition. The main entrance to the grounds leads to the Tower of Jewels, the outline of which will be defined by thousands of hand-cut glass prisms so hung that the least atmospheric disturbance will cause them to flash and scintillate in a thousand different tints and colors. On the western end of this court is the Triumphal Arch of the Setting Sun surmounted by the group symbolizing the Nations of the East, while on the east is the Arch of the Rising Sun surrounded by the group symbolizing the Nations of the West. To the west are the Horticulture Palace, the Education and Social Science Palace, Food Products Palace, Agriculture Palace, and Liberal Arts Palace, flanked on the extreme left by the Fine Arts Palace. To the east of the entrance is Festival Hall, Varied Industry Palace, Mines and Metallurgy Palace, Transportation Palace, and Manufactures Palace, this group being flanked on the extreme east by the Machinery Palace. The State Pavilions, beginning with California in the east, extend

along the water front to the west of the main group of buildings, and south of them are the Foreign Pavilions, while still to the west are the Live Stock Exhibit and the Athletic Field. The amusement features are in the eastern extremity of the grounds, grouped along a thoroughfare called The Zone. Over 250 groups and hundreds of individual pieces of statuary will adorn the grounds, while the flower display will be superior to that of any previous exposition. Nearly 40 foreign nations have sent exhibits, and 46 States have arranged for participation, while conventions and congresses in the hundreds have promised to meet in San Francisco during the Exposition.

Among foreign expositions worthy of mention are the following:

LYONS. An International Modern City Exposition was held in Lyons, France, from May 1 to November 1, at which the modern city was shown from every viewpoint, including street and park systems, waterworks, sewerage, hospitals, sanitary dwellings for the poor, and the fight against tuberculosis, alcoholism, and other unsanitary and social evils found in crowded populations. New York, Chicago, Philadelphia, and Cleveland were among the American cities that exhibited.

LONDON. An Anglo-American Exposition was held in Shepherd's Bush, London, from May to October, to celebrate the century of peace and the progress of the arts, sciences, and industries of the United States and the British Empire. The first £40,000 of the net profits of the exposition were set aside to be paid to the British-American Peace Committee for the foundation of scholarships and prizes in connection with educational, social, and commercial economics in both countries. At the close of the Exposition the British exhibits were to be sent to the Panama-Pacific Exposition to be held in San Francisco in 1915.

LEIPZIG. An International Exposition of the Book Industries and Graphic Arts was held in Leipzig, Germany, from May 6 to October 15. The grounds covered 20 acres and there were more than 20 buildings devoted to exhibition purposes. All of the industrial and manufacturing processes of printing and book-making were shown. The American Library Association and the Library of Congress were the only two American exhibits. It was by far the largest and most comprehensive exhibition of the kind ever held.

CHRISTIANIA. An exposition was held in Christiania, Norway, beginning on May 15, commemorative of the centenary of Norwegian independence from Denmark.

Among expositions announced for the future are:

PANAMA. The National Exposition of Panama, which has for its purpose the celebration of the 400th anniversary of the discovery of the Pacific Ocean by Balboa and the completion of the Panama Canal as well, was to have been opened on Nov. 3, 1914, but that event has been postponed until March 13, 1915.

MARSEILLES. A Colonial Exposition is expected to be held in Marseilles, France, during 1916.

SEVILLE. A Spanish-American Exposition will be held in Seville, Spain, beginning on Jan. 1, 1916, in celebration of the completion of the Alfonso XIII Canal. This exposition, which was

postponed from 1915, has made provision for three buildings of permanent construction as follows: Palace of Fine Arts, Palace of Decorative Industries, and Royal Pavilion.

BARCELONA. An International Exposition of Electrical Industries will be held in Barcelona, Spain, in 1917.

MISCELLANEOUS. Other important gatherings during the year were: International Exposition of Stone, held in Milan, Italy, from April to June; German Artisans' Exposition, held in Cologne, Germany, from May to October; International Exhibition of Home Manufactures and Commercial Products, held in Bristol, England, from May to October; Exposition of Hygiene, held in Stuttgart, Germany, from May 15 to October 31; Exposition of Machinery, Apparatus, and Supplies of all kinds used in Wine Production, Brewing, and Distilling, held in Budapest, Hungary, from May 24 to July 6; International Exposition of Marine Motors, held in Boulogne-sur-Mer, France, from June 15 to September 30; Exposition of Electrical Appliances, held in Frankfurt on the Main, Germany, from August 15 to September 6; Colombian Industrial and Agricultural Exposition, held in Cartagena, Colombia, from November 11 to December 31.

FABIAN SOCIETY. See SOCIALISM, *Great Britain*.

FACTORY INVESTIGATION COMMISSION OF NEW YORK. This commission, created by the Assembly of 1911, has been continued by the succeeding legislatures and instructed to report in February, 1915. The commission included in its membership Senator Robert F. Wagner, the chairman; Samuel Gompers, president of the American Federation of Labor; Mary E. Drier, president of Women's Trade Union League of New York; Abraham I. Elkus, who acted as chief counsel; and members of the State Assembly. Very extensive work has been done by the commission and startling discoveries have been made. Special investigations into the fire risks of factories have been carried on and bills have been passed on this matter, at the suggestion of the commission. There has, however, been much opposition on the part of the factory owners to the vesting of inspection powers in the hands of the Department of Labor. Industrial accidents, child labor, home work, and the better organization of the administrative machinery for carrying out labor laws have been among the subjects dealt with by the commission.

WAGES. Remuneration in several occupations were found to be exceedingly low. A study of the wages in confectionery factories and paper-box industries revealed the fact that in the former more than one-half the men received less than \$10 a week; half the women less than \$6; and more than two-thirds of the girls below 18 less than \$5.50. In the paper-box industry conditions were found to be quite as bad. A much more extensive investigation disclosed that of 104,000 employees, one-eighth received less than \$5 per week, while only one-sixth had \$15 or over. Secured from pay rolls of several hundred stores and factories throughout the State, these figures represent what is probably the earnings during the busy seasons, but which are higher than average wages throughout the year because of slack work and disability. Detailed studies of four industries were also reported on and showed similar results. A minimum wage was

© 1914 Panama-California Exposition

PANAMA-CALIFORNIA EXPOSITION, SAN DIEGO
LOOKING WESTWARD IN EL PRADO

urged before the commission by many as a remedy for these evils. The homes of many working girls were investigated and, although too few to permit statistical conclusions, many interesting discoveries were made. A report on the minimum wage in the United States and foreign countries was also made to the Legislature.

FAHNESTOCK, HARRIS CHARLES. An American banker, died June 4, 1914. He was born in Harrisburg, Pa., in 1835, and received an academic education. At the age of 16 he entered the Harrisburg National Bank and rose so rapidly, that by 1860 he had achieved a national reputation and in the following year became associated with the firm of Jay Cooke & Co., in Philadelphia. During the war, when this firm of bankers was the chief financial mainstay of the government, he took a prominent and active part in giving advice and assistance. In 1866 he removed to New York as the head of the New York house of this firm. In this position he was active in building the Northern Pacific Railroad and other great undertakings. When the firm of Jay Cooke & Co. failed in the panic of 1873 Mr. Fahnestock took charge of the bond department of the First National Bank in New York City. Eleven years later he became a director and vice-president of this institution. His business activities included railroads and other industrial enterprises. He gave largely to charities, although his name seldom appeared on subscription lists. He was a member of the boards of trustees of the American Museum of Natural History, the Metropolitan Museum of Art and the American Fine Arts Society.

FAILURES. See FINANCIAL REVIEW.

FALKENHAYN, ERICH VON. See WAR OF THE NATIONS.

FALKLAND ISLANDS. A British colony, composed of a group of islands in the South Atlantic. They are East Falkland (3000 square miles), West Falkland (2300), and about 100 smaller islands (totaling about 1200 square miles). South Georgia, a group of islands 54½° S., with an area of about 1000 square miles, a great whaling station, is a dependency of the Falkland Islands. Inclusive of South Georgia the population numbered in 1911, 3275 (2370 males and 905 females). The estimated population Dec. 31, 1912, was 3298. Sheep farming is the sole industry of the colony, the entire country being wild moorland fit for little besides pasture. There are no trees. The ground in November and December is covered with wild flowers. There were in 1912 about 711,367 sheep, 7530 cattle, and 3665 horses. Hides, skins, horns, hoofs, bones, tallow, wool, and guano are the exports. From South Georgia during the season ended March 31, 1912, over 400,000 barrels of whale oil were exported. Imports and exports for 1912 were valued at £93,264 and £623,875, respectively, against £93,913 and £471,156 in 1911. The United Kingdom contributed imports valued at £82,453, and received exports £378,843. Total tonnage entered and cleared, 375,996 (315,278 in 1911). Revenue, 1912, £34,036 (1911, £35,349); expenditure, £33,508 (£22,460). There is no public debt. The only town is Stanley, with 920 inhabitants. It has a fine inner and outer harbor and is a coaling station for vessels rounding Cape Horn. Beyond the town limits there are no roads. The islands were taken possession of by the British government in 1832 for the protection of the

whale fisheries. J. Quayle Dickson was the administrator in 1913 (W. L. Allardyce, Governor, appointed 1909). Other dependencies are the South Shetlands, Graham's Land, the South Orkneys, and the Sandwich group.

For naval operations in the vicinity of the Falkland Islands, consult the article on the WAR OF THE NATIONS, section on *Naval Operations*.

FARMING. See AGRICULTURE.

FAURE, JEAN BAPTISTE. A French singer and composer, died Nov. 10, 1914. He was born in Moulins in 1830, and when 13 years of age entered the Paris Conservatory. He became a chorister at the Madeleine. After winning first prize in the comic opera class at the conservatory he made his professional debut at the Opera Comique in 1852. In 1861 he appeared at the Grand Opera and from then on was continually successful. In 1876 he retired from the operatic stage, but returned to the Opera Comique after some years and remained there until within a few years before his death. In 1857 he became a professor at the Conservatory. In 1881 he was made a chevalier of the Legion of Honor. As a composer he became well-known for his sacred songs, particularly *Les Rameaux* ('The Palms'). In 1886 he published *La Voix et le Chant*, a treatise on vocalization. He was also a critic and collector of art.

FEDERAL COUNCIL OF THE CHURCHES OF CHRIST IN AMERICA. The work of the council was carried on aggressively during 1914 along its established lines, including State and local federations, foreign missions, home missions, religious education, social service, evangelism, Sunday observance, temperance, and peace and arbitration. During the year Rev. Sidney L. Gulick, of Japan, visited leading cities under arrangements made by the Federal Council to represent the missionaries of Japan concerning American relationships with the Eastern races. The council also published two lectures by Dr. Gulick—"A New Immigration Policy," and "The American-Japanese Problem." At the Church Peace Conference, held in Geneva on Aug. 2, 1914, Dr. Charles S. Macfarland, secretary of the council, delivered an address on "The Churches of Christ in America and International Peace." The council has undertaken to organize the religious activities in connection with the Panama-Pacific Exposition in California. It has also taken an active part in the movement to provide additional chaplains for the army and navy. A commission on peace and arbitration started an international campaign in 1913 which continued in 1914. The council in 1914 continued the compilation of religious statistics under the supervision of Dr. H. K. Carroll.

The denominations affiliated with the Federal Council are as follows: The Baptist Churches (North), the National Baptist Convention (colored), the Free Baptist Churches, the Christian Church, the Congregational Churches, the Disciples of Christ, the Friends, the German Evangelical Synod, the Evangelical Association, the Evangelical Lutheran Church (General Synod), the Mennonite Church, the Methodist Episcopal Church, the Methodist Episcopal Church (South), the African M. E. Church, the African M. E. Zion Church, the Colored M. E. Church in America, the Methodist Protestant Church, the Moravian Church, the Presbyterian Church in the U. S. A., the Presbyterian Church in U. S. (South), the Primitive Methodist Church, the

Protestant Episcopal Church, the Reformed Church in America, the Reformed Church in the United States, the Reformed Episcopal Church, the Reformed Presbyterian Church (General Synod), the Seventh Day Baptist Church, the United Presbyterian Church, the United Brethren Church, the United Evangelical Church, the United Presbyterian Church, and the Welsh Presbyterian Church. The national office is in New York City.

FEDERAL PLAN FOR CITY GOVERNMENT. See MUNICIPAL GOVERNMENT.

FEDERAL RESERVE BANKS. See BANKS AND BANKING.

FEDERATED MALAY STATES, THE. A British protectorate composed of four States in the Malay Peninsula, each administered under the advice of a British resident-general, being himself under the supervision of a high commissioner who is also the governor of the Straits Settlements. The table below gives the four States with their area, their 1911 population, and their several capitals:

	Area Sq. m.	Pop. 1911	Capitals
Perak	7,800	494,057	Taiping
Selangor	3,156	294,035	Kuala Lumpur
Negri Sembilan ..	2,550	180,199	Seremban
Pahang	14,000	118,708	Kuala Lipis
Total	27,506	1,086,999	Kuala Lumpur

For production, etc., see articles on PERAK, SELANGOR, NEGRI SEMBILAN, and PAHANG. The trade by States, together with the revenue and expenditure, will be found in the table below in Straits Settlements dollars:

	Perak	Sel.	N. S.	Pahang
Imports	19,942,952	19,893,057	4,494,368	1,864,221
Exports	36,597,998	29,631,902	6,213,385	3,830,158
Imports	1910	21,784,361	870,477	2,140,973
Exports	"	44,084,758	7,978,071	4,048,025
Imports	1911	29,849,243	4,708,194	2,277,768
Exports	"	55,535,590	8,420,746	4,890,639
Imports	1912	34,827,168	5,748,135	3,929,801
Exports	"	71,715,191	14,882,024	6,474,618
Revenues	1909	18,647,474	8,889,651	902,740
Expenditures	"	11,781,554	2,098,159	1,569,792
Revenues	1910	14,229,799	9,235,545	1,017,801
Expenditures	"	12,060,565	1,951,112	1,755,128
Revenues	1911	19,081,190	12,330,045	1,133,807
Expenditures	"	13,071,195	1,768,733	1,647,103
Revenues	1912	23,232,794	14,848,357	1,728,008
Expenditures	"	16,872,251	1,962,354	1,896,438

The Straits Settlements dollar is equivalent to \$0.56776.

The revenue and expenditure for 1909 reach a total of 25,246,864 and 23,633,852 S.S. dollars, respectively; for 1910, 26,553,018 and 23,593,610; for 1911, 35,056,544 and 25,202,749; for 1912, 42,647,687 and 30,990,487.

The Railways' Administration in 1914 operated 771 miles of line, including 37 miles opened in 1913, during which year there was a steady development of railway business. The Railways' Administration controls the line in the Malay Peninsula, including the Johore State Railways, leased since January, 1912, and in the adjacent islands of Penang and Singapore. In 1913 the Singapore Railway had 20 miles in length, which had been leased to the Railways' Administration from the colonial government from January, 1912, at a rental of \$150,000, and was purchased for \$4,136,000. The British residents are appointed by the Secretary of State for the colonies and are subordinate to the high commis-

sioner. They are assisted by a staff of European officers, with executive authority. The several State councils are presided over by the native rulers under the residents' advice, and include as members the dominant native chiefs. A Federal council was established in 1909 for the "joint arrangement of all matters of common interest to the federation or affecting more than one State, and for the proper enactment of all laws intended to have force throughout the federation or in more than one State." The high commissioner presides. The council meets annually; the first meeting took place Dec. 11, 1909, at Kuala Kangsar. Sir Arthur Young was high commissioner in 1914; chief secretary, Sir Edward L. Brockman.

FEDERATION OF LABOR, AMERICAN. See LABOR, AMERICAN FEDERATION OF.

FELS, JOSEPH. An American manufacturer and philanthropist, died Feb. 22, 1914. He was born at Halifax Court House, Va., in 1854, and was educated in private schools. In 1870 he began business as a traveling salesman for toilet soap manufacturers, and four years later engaged in the manufacture of soap with his father at Baltimore. He was very successful and accumulated a large fortune. In 1905 he became deeply interested in the single-tax propaganda, and from that time until his death gave large sums and much time to that cause. He founded the Joseph Fels Fund of America, to which he contributed \$25,000 annually for five years. This fund was used for promulgation of single tax theory. Mr. Fels expressed the belief that he had amassed his fortune by robbing the people, and therefore proposed to get rid of his for-

tune and to prevent others from following in his path by changing economic conditions. He therefore advocated the single tax and spent nothing except in the interest of that reform. His donations were not limited to the United States, but he gave largely in almost every country of the globe. He purchased 1300 acres at Hollesley Bay, England, to form a labor colony for the unemployed. This was later taken over by the British government. He also purchased 600 acres at Maylands, Essex, England, which was put under cultivation by small holders. He was one of the chief supporters of vacant lot cultivation in Philadelphia. He contributed frequently to magazines and other publications on the single tax and the taxation of land values.

FELTON, CHARLES. American public official, former United States Senator from California, died Sept. 13, 1914. He was born in Erie Co., N. Y., in 1832 and received an academic

education. While still a young man he removed to California, and in 1857 served as sheriff of Yuba Co., and was later tax collector for that county. He served as member of the California House of Representatives two terms and was for six years assistant treasurer and treasurer of the United States Mint at San Francisco. In 1885 he was elected to Congress, serving until 1889. In 1891 he was appointed United States Senator to fill a vacancy.

FEMINISM. The woman movement, although interrupted and diverted into new channels by the outbreak of the European War had been making steady progress during the earlier part of the year along general social and economic lines as well as in the purely political field of suffrage agitation. (See article, **WOMAN SUFFRAGE**.) Feminism has continued to develop in its multiform aspects, appearing now as a conscious struggle for opportunity and for emancipation from the shackles of tradition and convention, now as an awakening of the sense of social responsibility, and to a great measure as an invasion of new fields of professional and economic activity, a movement not always consciously feminist and due to the operation of economic forces.

In the United States women have been called in increasing number to important public positions. Dr. Katharine B. Davis was appointed Commissioner of Correction of New York City and since her appointment has introduced many reforms in the prison administration. Kate Barnard, formerly Commissioner of Correction in Oklahoma, who during her tenure of office exposed the exploitation of Indians by the politicians has continued her agitation although forced out of office. Ella Flagg Young, superintendent of schools in Chicago, was forced out of her position because of her opposition to the school book monopolies, but was reinstated because of the strong public opinion in her favor.

Women's organizations have been interested in the examination into the high cost of living. The Housewives' League of New York City co-operated in the inquiry into retail food prices and the establishment of three public markets in the city. An attempt of the New York State Civil Service Commission to exclude women from the examinations for the positions of directors of the newly established labor exchanges resulted in a vigorous protest from women's organizations which obtained from the commission a supplementary examination especially for women and the appointment of one woman director, in a bureau which will be concerned mainly with the employment of women and children.

In Germany and England women were active on various public bodies, educational, charitable, and other. In Norway there are to be for the next three years 11 women representatives on the city council of Christiania, two more than ever before. Of 60 representatives at Frederikstad 12 are women. In Switzerland women may now serve on the education committees and have been already summoned to them by three municipalities. In France the co-operation of women is being sought in the administration of new laws for the assistance of large families, the assistance of maternity, and the Children's Courts. Women are also demanding the abolition of night work for children, of public gambling, and of the State regulation of

prostitution. The Swedish government has appointed a committee including four women members to frame laws for the protection of unmarried mothers and their children.

On the economic field the feminist movement has taken the form of a growth in the women's trade union movement, and a demand for equal pay for equal work and for a legislative minimum wage for working women in underpaid trades.

The movement for a minimum wage has received a special impetus during the last year in the United States. The Industrial Welfare Commission in Oregon has fixed a minimum wage and a maximum working-day for working-women and the constitutionality of this law is being tested now before the United States Supreme Court. The Massachusetts Minimum Wage Commission has established wage boards to fix a reasonable minimum wage for women in certain industries. The New York State Factory Investigating Commission disclosed in its various reports conditions of work and wages for women which are being made the basis for a demand for a minimum wage in that State. Other States are conducting inquiries into the conditions of employment of women and children which will be made the subject of legislation. The idea of mother's pensions is being more widely agitated also.

The "teacher-mother" controversy has occupied much attention in New York City. The struggle between the Board of Education and the feminist supporters over the right of married teachers to bear children without losing their positions continued through the year and resulted in a victory for the feminists in an order from Dr. Finley, State Commissioner of Education, reinstating with full pay all teachers suspended by the board for having borne children. In Hungary men and women teachers receive equal pay for equal work. Married teachers when they become mothers get leave of absence, a contribution to the expenses of childbirth and a free substitute. Unmarried mothers, however, lose their positions permanently. In Holland the laws of 1911 forbidding marriage to all women teachers was repealed owing to energetic propaganda of Dr. Rutgers Hoitsemma. In Holland, Belgium, Denmark, and Russia women teachers are free to marry and to continue their work.

The struggle for equal pay for women teachers was particularly active in Belgium, where the feminist organizations carried out imposing public demonstrations on the question. The Hague Municipal Council decided against equal pay for equal work on the ground that men have families to support. An agitation was carried on in Holland over the law forbidding night work for women which will drive women out of the telephone, telegraph, and postal services. In Great Britain considerable excitement was caused by the rejection on the ground of custom of Miss Emily Bebb's appeal for admission to the bar. In Germany women have for the first time been named professors, Drs. Plehn, Meisstorff, Rabinowitsch, and Hirsch. A fifth, Dr. von Linden, has been called to a chair in Roskoff University, Hungary. In Sweden the gifted writer, Selma Lagerlöf, was elected a member of the Swedish Academy, one of the most conservative institutions of that country, the only precedent being the previous election

of the novelist and feminist, Frederika Bremer. In Denmark Dr. Estrid Hien, eye specialist, has been elected a member of the Board of the Royal Institute for the Blind, being the first woman to hold this position. In Denmark also the first female building engineer passed her examination with honors.

WOMEN AND THE WAR. The outbreak of the European War gave a new direction to women's activities. Their field of employment was widened in some ways and they took over occupations in the warring countries usually assumed only by men. Some attempts at enlistment in men's dress were made and at the organization of women's battalions. But the general tone of the feminist utterances on the war was to deplore militarism and to point out the necessity of women's emancipation for the future peace of the world. The manifesto of the German suffragists is typical in this respect: "We women of all nations have in war-time the same fate; we must give up the life we brought forth; we must endure that fine warm humanity and kindness are sacrificed to horrible destruction; we must work to avoid the misery which war brings; we have to heal the wounds which men have inflicted on each other by thinking out the most refined methods of slaughter. In times of peace we women of all nations are united by the same lot. . . . Our humanity knows no national hatred, no national contempt. We are nearer to true humanity than men. Above the war of the nations we stretch out sisterly hands, we greet each other with heads bowed in mourning, more united than ever in the consciousness that only if women are freed and help to guide their States the world will be spared a repetition of such horrible happenings."

In Germany the leading women's organizations have formed a National Women's Army the object of which is to perform social service during the war supplementary to the Fatherland's Women's Union and the Red Cross. It aims at the care of families whose breadwinner is at war or unemployed because of the war, the securing of work for women who have been forced into the labor market by the war or who are willing and able to do work formerly done by men, the collection and distribution of cast-off clothing, the care of the fruit harvest, the organization of public kitchens and crèches and of workrooms for the employment of women.

The activity of the English women has been along similar lines. A truce was declared by the militant suffragists. An international demonstration of the women of all nations against the war was held in London, Aug. 4, 1914. One woman, Mrs. Tennant, was appointed on the Relief Committee organized by the government. The Women's Trade Union League and other women's organizations combined to form a Central Committee on Women's Employment, which under the secretaryship of Miss Mary Macarthur has drawn up schemes for the relief and employment of women in distress on account of the present war. These schemes include the training of workers in trades in which new openings are now offered for British trade, training in skilled trades in which there is normally a shortage of labor, training in domestic economy, especially cooking, production of useful articles which would not compete with private business, altering, making, and mending of workers' own garments, and further schemes for the employ-

ment of girls under 16 and of clerks, typists, and professional women.

The women of the United States have been active in organizing demonstrations against war, and in the organizing of Red Cross work and of relief, especially for Belgium. See also *AGRICULTURE, Farm Women; WOMAN SUFFRAGE.*

FENCING. The twenty-first annual intercollegiate fencing tournament was won by Columbia for the second successive year. The U. S. Naval Academy was second. Columbia won 32 matches and lost 13, while the Navy team scored 29 victories as against 16 defeats. Other results were: Cornell, won 21, lost 24; Princeton, won 20, lost 25; Harvard, won 17, lost 28; Yale, won 16, lost 29. The individual prize went to Studdiford Pitt, Jr., of Columbia, who won 13 out of 15 bouts. The sabres championship, the first ever held by the association, was captured by Waldo S. Shumway of Columbia.

The dual matches resulted as follows: Columbia defeated Yale by 5 to 4; Harvard by 9 to 0; Pennsylvania by 6 to 3; and Cornell by 8 to 1. Columbia lost to the Navy by 4 to 5. The Naval Academy defeated Yale by 7 to 2; Harvard by 6 to 3; Cornell by 5 to 4; Columbia by 5 to 4; and Pennsylvania by 6 to 3. Cornell won from Harvard, Yale, and Pennsylvania, and lost to the Navy and Columbia. Pennsylvania won from Yale, and Harvard, and lost to Columbia, the Navy, and Cornell. Harvard won from Yale, and lost to Columbia, Cornell, Pennsylvania, and the Navy. Yale lost all its matches.

In the national championships held by the American Fencers' League, Dr. S. D. Breckinridge of the Washington Fencers' Club won with the foils, and Dr. F. W. Allen of the Boston A. A. won with the dueling swords. The sabres title went to H. Van Blyenburgh of the New England division. The women's championship with the foils was captured by Miss Margaret Stimson of the Fencers' Club of New York.

FERDINAND I, King of Rumania, succeeding his uncle, Charles I (q.v.) on Oct. 11, 1914. He was born in 1865, and, like his predecessor, was a Hohenzollern and a Roman Catholic. He is the son of the brother of the late King

Charles and Princess Antonia of Portugal. King Ferdinand is a first cousin of the King of the Belgians and of the Czar of the Bulgarians. He is closely allied to the House of Saxe-Coburg and Gotha to which his wife, Queen Mary, belongs as daughter of the late Duke of Edinburgh. Six children were born of the marriage, the oldest of whom is Crown Prince Charles, who in 1914 was 21 years of age. On October 11th, following the death of King Charles, the Rumanian Parliament was convoked and the new king took the oath of allegiance. Subsequently the government issued a proclamation stating that the new king would follow in the footsteps of his predecessor and realize the ideals of the Rumanian race. See RUMANIA. **FERRIS**, Dr. ALBERT WARREN. See SARATOGA SPRINGS.

FERTILIZERS. Until quite recently it has been very difficult to get complete and accurate data regarding the world's production and consumption of fertilizers or the international trade in fertilizing materials. Fortunately the International Institute of Agriculture at Rome has undertaken to supply this deficiency in a systematic way, and now issues half-yearly reports which give a more timely and satisfactory review of the fertilizer situation than has ever before been available. These reports are to appear on the first of March and of September of each year. The first report, which appeared Sept. 1, 1914, gives the available statistics for 1913 and some data for the first half of 1914. The statistics include production, imports and exports, consumption, and prices of phosphatic, potassic, and nitrogenous fertilizers. A bibliography of recent literature relating to the subject is also given. The figures in general indicate an extension of the use of fertilizers throughout the world in 1913 as compared with 1912, and the same appears to have been true of the first half of 1914. The outbreak of the European War, however, seriously upset the fertilizer business, although the extent to which this has occurred cannot now be fully estimated.

NITROGEN. The total production of Chilean nitrate of soda, the principal source of nitrogen in fertilizers, was 2,586,975 metric tons (of 2204.6 pounds each) in 1913, as compared with 2,773,459 tons in 1912. The amount consumed for agricultural purposes in 1913 is estimated at 2,098,230 tons. The latest reports on Chilean nitrate show that production has greatly exceeded export in spite of attempts at a limitation of output, and prices have fallen accordingly. The supply on hand Nov. 1, 1914, is officially estimated at 1,060,000 tons, as against 668,400 tons at the same date last year. German imports, normally the largest in Europe, stopped in August, but British imports greatly increased, and prices have been lower than at any time in the past fifteen years.

Ammonium sulphate, the next greatest source of supply of nitrogen, was produced to the extent of 1,448,440 tons in 1913, as against 1,306,600 tons in 1912, and consumed for agricultural purposes to the extent of 1,210,550 tons. The increase in production and consumption of this fertilizing material has been especially marked in the United States.

Of the so-called synthetic nitrogenous fertilizers, calcium cyanamid is reported to have been produced to the extent of 114,093 tons in 1913, as compared with 94,438 tons in 1912, and

Norwegian (calcium) nitrate to the extent of 70,000 tons (estimated) in 1913. The published figures for these products are, however, so discordant as to be of little value, although they indicate in general a marked increase in the production of these materials.

One of the most important sources of nitrogen in fertilizers, which is, however, usually overlooked in compilations of fertilizer statistics, is the organic forms of nitrogen, such as tankage, fish scrap, oil cakes, garbage, etc. The demand for many of these products for use as feeds is becoming so great that they are steadily being withdrawn from use as fertilizers. In the case of fish scrap there has been shown to be still enormous waste of material valuable for fertilizing purposes.

PHOSPHATES. The world's production of phosphates in 1913 was approximately 6,600,000 metric tons, as compared with 6,888,908 tons in 1912, the largest producers being the United States, 3,202,636 tons mined and 3,020,905 tons sold; Tunis, 2,284,678 tons mined and 1,923,000 tons exported; Algeria, 438,601 tons exported; France, 335,000 tons. The United States is by far the largest producer of phosphatic rock. Recent estimates indicate that the total reserve supply of phosphate in the United States is equivalent to 10,519,875,000 tons of high-grade rock, 7,500,000,000 tons of which is found in the recently discovered western phosphate fields. The amount of basic slag produced in 1913 was approximately 4,246,000 tons, as against 4,144,000 tons in 1912. The chief producers of this material were: Germany, 2,200,000 tons; France, 700,000 tons; Belgium, 500,000 tons; Luxembourg, 250,000 tons; the United Kingdom, 404,000 tons; and Austria-Hungary, 100,000.

A large amount of the phosphoric acid used in fertilizers is derived from bones, but statistics of the production and consumption of this material are very incomplete. The large exporting countries are Argentina and British India.

POTASH. The production of German potash salts in 1913 was 11,607,510 metric tons of crude salts and 1,647,906 tons of refined salts, the corresponding figures for 1912 being 11,070,014 and 1,461,201 tons, respectively. The total amount of potash salts, calculated as actual potash (K_2O), sold for agricultural purposes in 1913 was 1,003,913 tons, as compared with 903,759 tons the previous year. Of this amount, 749,000 tons was used in Europe and 242,283 tons in America, as compared with 668,062 and 224,075 tons, respectively, for the preceding year. The imports of potash salts into the United States during the fiscal year ended June 30, 1914, are stated to have aggregated 1,086,243 tons valued at \$15,160,123, as compared with 882,560 tons valued at \$12,484,576 in 1913. During the latter half of 1914, and especially since war was declared in Europe, the exports of potash salts from Germany have been relatively insignificant, although the embargo on the exportation of potash was lifted August 31, and small shipments through the Netherlands have been made since that date. The stocks on hand in Germany are stated to be abundant, and the cessation of exports is due mainly to a failure of transportation.

The shortage of the supply of German potash salts has stimulated inquiry as to other possible sources of supply. No results of practical

importance from inquiries regarding the occurrence of potash deposits elsewhere than in Germany were reported during the year except in the case of Spain. Here preliminary examinations indicated the occurrence in certain provinces of important deposits similar to those of Germany. A royal decree was issued and a law proposed during the year providing for examination, reservation, and government control of these deposits. Interest was awakened in processes for rendering the potash of feldspar and other silicates available for fertilizing purposes, but these do not appear to be economically feasible unless some other salable product results from the same operation. The investigations of the U. S. Department of Agriculture indicate that the most promising American source of potash is the annual crop of giant kelps on the Pacific coast. Working maps, which have been made of nearly all of the commercially available kelp beds from the Cedros Islands to the Shumagins off the Alaskan coast, show that these beds aggregate nearly 400 square miles capable of yielding annually either as dried kelp or as pure potassium chloride over six times the present consumption of soluble potash salts in the United States, or something more than the world's present total production. It is believed that the development of a great industry, based on the conservation and utilization of this resource, is now only a matter of time.

The European War has sharply emphasized the need as regards potash, and in a less degree for all other fertilizing materials, of careful conservation and full development and utilization of the various minor sources of such materials, as well as the stoppage of waste in the exploitation of the available supplies. For example, it has been shown that "if all the coal now coked in the United States were treated in modern by-product ovens and the ammonia thereby saved, the amount of nitrogen so obtained would be about equal to that now consumed in the fertilizer trade of the country." Investigations made by the U. S. Department of Agriculture indicate that in Florida, where the most actively worked phosphate mines are situated, about two pounds of phosphorus go to waste for every pound produced in merchantable rock. Methods of preventing some of this enormous waste are being studied by the Department with considerable promise of success. Certain minor sources of potash, such as ashes, sugar making and wine making residues, wool washings, and the like, are deserving of more attention than they have generally received. The use of sodium salts as a substitute for potash salts has been suggested, but little of practical value is to be expected from such substitution. The use of lime to liberate potash in the soil is also frequently recommended, but there is no positive scientific evidence to show that lime accomplishes this result, and even if it did it would only be a species of soil robbery which must later be made good. If, as has been stated, the potash available for use as fertilizer in 1914 will be only three-eighths of the normal supply, it is evident that potash salts must for a time at least be more economically used, but it is believed that this can be done without any serious loss and in some cases with actual profit as regards agricultural production.

During the year there was considerable exploitation of so-called "radio-active fertilizers"

(low-grade or partially extracted uranium ores). While it has been shown that radium emanations have a decided effect upon the germination and growth of plants, the results of experiments so far made leave it extremely doubtful whether the radio-active fertilizers used in the amounts recommended (20 to 25 pounds per acre) exert any influence as a result of such emanations, since the radium already present in an acre-foot of soil is on the average about one hundred times as great as that contained in the acre application recommended. However, the uranium present may have some stimulating effect on plants, as has been shown to be the case with various other minor or unusual soil constituents. See AGRICULTURE, *Radio-activity and Plant Growth*.

The widespread interest in the utilization of peat for fertilizing purposes was evidenced by a number of investigations reported during the year. A method of treating peat to make it more active as a fertilizer and as a medium for the growth of nitrogen-fixing bacteria (so-called bacterized peat) was published during the year. Tests of the bacterized peat prepared by this process indicated that in addition to being an excellent medium for the growth and distribution of nitrogen-fixing bacteria it possessed special fertilizing properties of its own. A great step in advance in the utilization of undeveloped fertilizer resources will have been made if some means such as this can be found for making the vast stores of nitrogen in peat beds available for fertilizing purposes.

FIELD, WELLS LAFLIN. An American rear admiral, retired, died Nov. 28, 1914. He was born in St. Louis, Mo., in 1846, and graduated from the United States Naval Academy in 1867. In the following year he was appointed ensign. He was promoted to be lieutenant in 1871 and lieutenant commander in 1892. He reached the rank of captain in June of 1902. In the same year he was retired with the rank of rear admiral.

FIJI ISLANDS. A group of islands in the southern Pacific, constituting a British crown colony. It includes all those islands, rocks, and reefs, lying between latitudes 15° and 22° S., and between longitudes 177° W. and 175° E. Including uninhabited rocks, etc., the islands number between 200 and 250. The principal inhabited islands are Viti Levu, 4112 square miles; Taviuni, 217; Kadavu, 124; Koro, 58; Gau, 45; and Ovalau, 43. Total area, including the dependency of Rotumah (14 square miles), is 7435 square miles. Total population (1911), 139,541 (80,008 males, 59,533 females); 1901, 120,124; 1881, 127,486. Of the total 1911 population, 87,096 were Fijians, 40,286 Indians, 3707 Europeans, 2758 Polynesians, 2401 half castes, 2176 Rotumans, 305 Chinese, 812 other. The aboriginal population numbered 140,000 in 1871, but the epidemic of measles in 1875 reduced it by more than one-fourth. The Indian immigrant population, which has replaced the Polynesians, numbers 48,614. The native birth rate was 38.1 and the death rate 31.2 per thousand

in 1912. The chief products for export are sugar, copra, and fruits, principally bananas and pineapples, and effort has been made to introduce rubber planting and stock raising. The sugar export in 1912 was 61,728 tons, valued at £671,713; fruits, £120,510; copra, 13,710 tons, valued at £242,073. Total imports, 1912, £940,044, against £957,079 in 1911; exports, £1,058,960, against £1,276,207 in 1911. Customs revenue, 1911, £165,146. There are no railways. There is a telegraph line of 54 miles, a telephone line of 125, and wireless stations at Suva, the capital, Cabasa, and Waicuo. Revenue, 1912, £283,947, against £240,395 in 1911; expenditure, £268,158, against £265,347 in 1911. Tonnage entered and cleared in 1912, 613,343, of which 597,890 British; in 1911, 584,835, of which 577,731 British. Public debt, £82,815, of which £30,815 is to the imperial government and bears no interest. Sir Ernest Bickham Sweet-Escott, appointed July, 1912, was Governor in 1914.

FILTRATION. See WATER PURIFICATION.

FINANCE. See sections so entitled under various countries, and under the States of the United States. See also FINANCIAL REVIEW.

FINANCIAL REVIEW. **GENERAL CONDITIONS.** On the whole the year 1914 was one of financial pessimism and industrial depression. This was especially true after the outbreak of the European War, but was true also for the earlier months. The year opened with a slight revival after an unusually gloomy period during the closing quarter of 1913. In January money appeared to be abundant, loan rates were low, the stock market responded with a vigorous upward movement, and industry revived. President Wilson's trust message was well-received; British Consols rose rapidly in value; and a New York State bond issue of \$50,000,000 was oversubscribed five times. In February, however, this upward tendency was checked only to be followed by recession in March. The Irish question in Great Britain, the precarious condition of American railways resulting in the discharge of thousands of men, stock market declines, and the threatening entanglement with Mexico were factors in the continued dullness of April and May.

Abroad the great banks continued to draw in gold; there was a conspicuous Canadian failure resulting in disturbance at London; Russian securities fell precipitately at St. Petersburg; and in June the firm of H. B. Claflin & Co. of New York failed. In July the stock market went downward; New Haven and Missouri Pacific stocks reached minima never before equaled; and on July 23 came the stunning effect of the Austrian note to Serbia.

Yet aside from the effects of war, business conditions were not good in July. Causes for this depression were: tariff changes; banking and trust legislation; Mexican disturbances; and the railway situation. In the absence of war conditions probably would have improved. In the first place the enormous agricultural yield valued at ten billions of dollars exceeded all precedents. The cotton and wheat crops, which are factors in foreign trade, were especially notable. The Interstate Commerce Commission gave the railways much needed relief by permitting an advance of 5 per cent in freight rates. Banking and credit conditions were greatly improved by the inauguration of the new Reserve System. Trust legislation was completed with

little disturbance. But the war outweighed all other factors.

THE WAR AND ITS EFFECTS. As already stated, even before the outbreak of hostilities, the sensitive barometer of finance had indicated a portentous situation. The Reichsbank had added \$100,000,000 to its reserve; the Bank of Russia, \$150,000,000; the Bank of France, \$170,000,000; and the prices of securities everywhere were falling. Several days before the Austrian ultimatum, discount rates were advancing, sterling exchange in New York moved up rapidly, Paris made every effort to secure gold, securities were being sold in great quantities in every market, and British and French government bonds were declining significantly; on July 23, Servian government bonds fell 4 per cent in one day. As late as July 27, Lombard Street cabled to New York that war was improbable. On that same date, however, \$12,000,000 in gold left New York for London at an extraordinary rate of insurance; security prices dropped sharply everywhere; and American wheat rose seven cents a bushel.

In ten days following Austria's declaration of war on Serbia, American bankers shipped \$45,000,000 in gold to Europe. Sight exchange on London at New York normally \$4.86 rose to \$5, then \$6, and then \$7, a rate never before equaled and evidencing the breakdown of the machinery of exchange. This was due mainly to the fact that all Europe was demanding gold from us and at the same time taking refuge behind a moratorium. By November 15 American bankers had paid \$180,000,000 in gold to Europe, in addition to \$120,000,000 shipped in the months of 1914 previous to the war, a remarkable evidence of financial soundness. The government coöperated with the bankers in providing emergency currency under the amended Aldrich-Vreeland Act. The Treasury Department created a Bureau of War Risk Insurance authorized by Congress September 2; the bankers themselves, moreover, issued clearing-house certificates to meet the immediate needs, and undertook concerted action in various ways.

The New York City banks were early in August confronted with the necessity of providing New York City with a gold loan of \$100,000,000 to meet maturing city warrants held in London and Paris. Every bank and trust company in the city except one subscribed its share. New York bankers then created a pool of \$100,000,000 to meet pressing mercantile obligations abroad and to provide a share of the \$100,000,000 cotton pool. That the banks met successfully these most extraordinary demands in spite of the fact that the clearing house banks in New York City were \$50,000,000 below their regularly required reserves in the early stages of the war revealed an almost perfect confidence in the soundness of American credit. See BANKS AND BANKING.

The war had a disastrous effect on American foreign trade. The cotton growers, who ordinarily export one-half their crop, were estimated to have lost nearly a billion dollars in the reduced value of their product. Numerous manufacturers suffered from the lack of German dyes. Many other industries, however, speedily revived as the result of the demands of European nations for supplies and munitions of war. Toward the close of the year the export trade in cotton was revived, though the total exports for the year were only 2,429,000 bales, as com-

pared with 5,349,000 in 1913. South American trade was slow to develop in spite of the establishment of branch American banks in several centres. This reflected the inability of South America to buy owing to the loss of the European market. Some advantage was secured by legislation admitting American owned vessels to American registry, but the effect on the volume of trade was slight. The proposal for the government to purchase merchant vessels and engage in the foreign carrying trade, especially with South America, failed of execution.

WAR LOANS. Doubtless the most far-reaching financial effect of the war was the sinking of billions of capital. Up to the close of the year Germany had voted two loans of \$1,250,000,000 each, on August 4 and October 2; Russia, \$3,000,000,000 (estimated); Austria, \$2,000,000,000 (estimated); France, one of \$1,340,000,000 on August 4, and one of \$1,700,000,000 on December 23, the largest ever voted by any nation; Great Britain, one of \$525,000,000 on August 4, and one of \$1,125,000,000 on November 16. In addition large sums had been voted by Prussia, Saxony, and the minor states of Europe; and several hundred millions had been given by private persons for military and relief purposes. If to these sums were added the enormous losses in wages due to the diversion of more than 18,000,000 men from industry to war, and the accompanying losses in production and commerce, a total estimated to exceed three score billions of dollars is reached.

STOCK EXCHANGE. The prospect of war caused violent commotion on the world's stock exchanges. The bourses at Toronto and Madrid closed July 28; those at Vienna, Budapest, Brussels, Antwerp, Berlin, and Rome on July 29; those at Paris, St. Petersburg, Montreal, and in all South American countries, July 30. Early July 31 the London exchange closed for the first time in its history, to be followed after a few hours by the New York exchange. At the same time other exchanges throughout the country closed. The great exchanges at Paris and London and New York had not closed until, as a result of the perfect deluge of selling orders, there no longer existed a real market. The closing of the exchanges called for unusual forbearance on the part of bankers with loans secured by exchange collateral. The New York exchange members fixed the level of prices existing on July 30 as the official minimum at which under the control of a Committee of Five a limited amount of transactions were afterwards carried through. This measure was taken as a means of affording moderate protection to necessitous sellers. Through various special committees of the exchange more than \$100,000,000 of bonds were transferred and also more than 250,000 shares of stock before the close of November. The Philadelphia exchange held public auction sales of stocks and bonds on several days, prices being found to range close to the level of July 30. The New York exchange opened for business in a restricted list of bonds on November 28, and on December 12 for trading in 181 specified stocks, but with a set of minimum prices in force in control of a Committee on Minimum Prices. Statistics of total dealings showed that stock transactions on the New York Exchange aggregated 47,899,628 for the entire year. In 1913 the total was 83,283,582; and in 1912, 131,051,116. Total bond dealings for

the year were \$468,898,100. In 1913 they aggregated \$501,155,920; and in 1912, \$674,215,000. In neither stocks nor bonds was any approach made to the great totals of prosperous years. Statistics of average quotations of 25 leading railroad stocks showed that the December maximum was 71.13; minimum, 66.76; and closing, 68.04.

For 1913 the December maximum had been 80.56; and the minimum, 77.25. Industrial stocks, however, were only slightly lower in December, 1914, than in December, 1913. The average prices of bonds were at a maximum of 89.42 on February 4, and at a minimum of 81.42 on December 2.

EMERGENCY CURRENCY. The closing of the stock exchanges and the declaration of a moratorium in various European centres forced American banks to take special measures to avoid a banking panic. At a conference in New York City between Secretary McAdoo and a group of New York bankers representing the Clearing House, it was decided on August 2 to issue emergency currency under the Aldrich-Vreeland act of 1908 as modified by the Federal Reserve Act of December, 1913, and to issue also clearing house certificates. To facilitate the issue of emergency currency a special amendatory act reducing the tax on such notes for the first three months of their circulation to 3 per cent and raising the limit of issues to 125 per cent of capital and surplus was hastened through Congress and signed by the President on August 4. This special act also enabled State banks affiliated with the Federal Reserve System to take out notes. Moreover, cotton and tobacco warehouse receipts were made available for note issues. By September 1 more than \$250,000,000 of Aldrich-Vreeland notes had been issued; a total of \$384,500,000 such notes were issued, of which \$127,272,000 were retired by December 1. There was still outstanding on December 31 the sum of \$150,836,000. They were accepted freely by banks and individuals. Little publicity was given to the issue of clearing house certificates but an enormous amount of them both in New York and elsewhere was issued. At New York the first issue of such was made on August 3, the last on October 15, and all were retired by November 28. The largest amount outstanding at New York at any one time was \$109,185,000, as compared with \$88,420,000 in 1907.

FOREIGN TRADE. The foreign trade of the year was distinctly less than that in 1912, and that of 1913. Thus the total value of exports of merchandise for the first 11 months was \$1,868,452,000 as compared with \$2,250,929,000 for the same period in 1913 and only slightly less for 1912. The total value of imports for the first 11 months was \$1,674,896,000. This was slightly larger than in either of the two preceding years. The excess of exports in 1914 was therefore only \$193,555,000, whereas in 1913 it had been \$642,100,000, and in 1912 \$484,624,000 for the 11 months. In other words, exports for 11 months were 17 per cent less than in 1912 or 1913, while imports were 4 per cent larger than in 1912 and 1 per cent larger than in 1913.

Much interest was attached to the fact that imports showed a larger proportion of duty-free products, and a great decrease in most lines of dutiable products. While imports as a whole

increased, customs collections diminished. Duty-free imports comprised 61 per cent of all imports, and increased 21 per cent in value over 1913. Dutiable imports comprised only 39 per cent of all imports and decreased 11 per cent from 1913 value. Among duty-free imports food showed an increase of 50 per cent in value; crude raw materials, 14 per cent; and manufactures, 17 per cent. Among dutiable imports crude materials fell 44 per cent in value; foods gained 10 per cent; and manufactures diminished 18 per cent. Crude-material imports showed a total gain of 6 per cent; foods and animals gained 28 per cent; but manufactured goods decreased 6 per cent. The principal gain in imports was in food products, there being increases in live stock, bread stuffs, meats, dairy products, and sugar. There was also a tremendous gain in raw wools and smaller gains in hides and skins. There was, on the other hand, a large decrease in precious stones. At New York the total of imports and exports of merchandise was \$1,799,929,000 for the entire year, a decline of \$108,337,000 from 1913. Customs collections of the port were \$38,542,000 less than in 1913, the total being \$167,081,000. Imports showed none of the expected dumping of European wares as the result of Democratic tariff changes, but were \$35,000,000 less than in 1913. Exports of domestic goods were \$104,600,000 less than in 1913. The exports of gold and silver for the year totaled \$155,395,000, of which about two-thirds went out in May, June, and July.

GREAT BRITAIN. The British Board of Trade figures showed that total imports for the first 11 months of 1914 were valued at £629,915,000. This was nearly 10 per cent less than for the same period in 1913, and 6 per cent less than in 1912. Total exports for the 11 months were valued at £495,933,000. This was a decrease of about 15 per cent from the figures for the same period for 1913 and 9 per cent from 1912. During the first seven months of the year the totals of imports and exports were very similar to those for 1913, but following the outbreak of the war very sharp declines were observed. Thus the imports for September, 1913, were £61,359,000, but for September, 1914, they were only £45,056,000. Likewise, the exports for September, 1913, were £49,277,000, but for September, 1914, they were £33,527,000. The differences in October and November were equally or even more striking.

BANK CLEARINGS. For the month of January the clearings in 120 American cities totaled \$16,053,000,000, an amount approximately equal to that of January, 1913, and greatly exceeding the same month in any previous year. For February the total was \$12,736,000,000; March, \$14,112,000,000; April, \$14,767,000,000; May, \$13,036,000,000; June, \$13,812,000,000; July, \$14,361,000,000; August, \$9,814,000,000; September, \$9,897,000,000; October, \$11,594,000,000; November, \$10,954,000,000. The totals for the first two quarters were approximately the same in 1914 as in 1913 and 1912. Following the outbreak of the war, however, a decided slump reduced the totals by from 10 to 20 per cent. The same general statement applies to the movement of bank clearings in New York City. During the first two quarters the totals compared favorably with those of 1912 and 1913; but a sharp decline was seen beginning with August. Thus the New York clearings in

November were \$5,399,000,000; whereas in November, 1913, they were \$7,587,000,000, and in November, 1912, \$8,819,000,000.

In the country as a whole during the 11 months there was a decrease of 9 per cent from the 1913 total for the same months, 11 per cent from 1912, 2 per cent from 1911. In New York City the total for 11 months was 11 per cent less than in the same months of 1913, 16 per cent less than in 1912, and 9 per cent less than in 1911. Thus New York City suffered a heavier decline than the rest of the country.

Canadian bank clearings passed through a similar course. For the first 11 months of 1914 they totaled \$7,298,000,000, or 11.3 per cent less than for the same months in 1913. November clearings at Montreal were 17 per cent less than in November, 1913, at Toronto, 20 per cent less, and at Winnipeg, 30 per cent less.

NEW INCORPORATIONS. According to the *Journal of Commerce*, new incorporations of companies with \$1,000,000 capital or over in the Eastern States for the first 11 months of 1914 totaled \$789,497,000. This was only slightly more than 50 per cent of the total for the same period of 1913, and only 37 per cent of the total for the first 11 months of 1912. During every month of 1914 the authorized capital of new companies was much less than in the corresponding month of the preceding year except in November.

BUILDING. According to *Bradstreet's* the total expenditures for building during the first nine months of 1914 was \$632,837,000. This was a decrease of 8.7 per cent as compared with 1913. The total in 1912 moreover for the same period had been \$714,476,000. The month of October, 1914, showed a decrease of 21 per cent, and November a decrease of 13.7 per cent, in comparison with the same months of 1913. These figures indicated a considerable amount of unemployment in building and allied trades. The Canadian figures for November showed a decrease of 47.7 per cent from the figures for November, 1913.

FAILURES. According to *Bradstreet's*, the total number of failures for the first 11 months of 1914 were 14,555, with total assets of \$169,418,000, and total liabilities of \$296,522,000. For the 11 months failures were 1700 more numerous, while liabilities were \$43,100,000 greater and assets were \$28,355,000 greater than in 11 months of 1913. The number of failures was very much greater than in any preceding year for the same 11 months; liabilities were exceeded only in 1907, though approached in 1908; assets likewise were exceeded in 1907, and approached in 1908. Comparison by months shows that failures were more numerous in every month in 1914 than in the corresponding month in 1913. As a rule also liabilities and assets were greater month by month in 1914 than in 1913. The number of failures in the first quarter of the year was 4195; in the second, 3553; in the third, 3777; in October, 1445; and in November, 1585. Liabilities were \$81,515,000 for the first quarter; \$66,790,000 for the second; and \$99,778,000 for the third. They dropped to \$23,561,000 in October, and \$24,876,000 in November. Maximum liabilities were shown by the failures of August and January. The effect therefore of the unusual disturbance of the European War was slight.

THE FORD COMPANY. On January 5, Mr. Henry Ford, President and controlling stockholder of the Ford Motor Company of Detroit, announced that \$10,000,000 of the profits of that company would be distributed among its employees during 1914. This distribution was to be made by semi-monthly additions to pay checks. At the same time three shifts of eight hours each replaced two of nine hours each, thus adding about a fourth to the number of employees. This raised the number of employees to 28,000. A minimum wage of five dollars a day was provided for employees of 21 years or over meeting certain standards, regardless of position. This distribution was made possible by the extraordinary prosperity of the firm. In the year ending Sept. 30, 1913, the assets increased from \$20,815,000 to \$35,033,000, and in the year ending September 30, 1914, its assets increased to \$61,632,000, and its surplus from \$28,024,000 to \$48,827,000. Cash on hand and in banks aggregated \$27,441,000 Sept. 30, 1914. Mr. Ford declared his scheme was "neither charity nor wages," but profit-sharing and efficiency-engineering. He believed that labor does not get its just share of earnings. Moreover, his company desired to promote the happiness of employees and bring labor and capital together. In November it was reported that 9200 employees were benefiting by the plan. They had increased bank deposits and insurance by large sums and purchased homes in large numbers.

Opinion differed widely as to the soundness of this innovation. It was pointed out that it was not true profit sharing; that it would embarrass numerous other companies in the automobile and various branches of the metal trades whose employees would demand similar increases; and later inquiry showed that the scheme was accompanied by considerable tutelage and dictation to employees in their private affairs. On the other hand it was argued that this scheme did powerfully promote efficiency. In addition to the regular quarterly dividends of 15 per cent, an extra cash dividend of \$2,000,000 was paid in June. Later in the year several thousand men were laid off, partly owing to usual seasonal change and partly to the European War.

FINLAND. A grand duchy on the gulf of Bothnia, forming part of the Russian Empire. Capital, Helsingfors.

AREA, POPULATION, ETC. Total area, 144,249 square miles, of which 11 per cent is under lakes. Total population, 1911, 3,154,824; 1906, 2,933,856 (2,523,049 rural, and 410,807 urban). Of the population in 1911, 3,096,263 were Evangelical, 52,728 Orthodox Greek, etc. Finnish was the mother tongue of 2,578,145, Swedish of 338,961, etc. Helsingfors had 153,642 inhabitants in 1911, compared with 130,844 in 1907; Abo, 50,994, and 46,637; Tammerfors, 45,791, and 43,696; Viborg, 27,769, and 33,175; Uleåborg, 20,896, and 18,398. There were 18,735 marriages in 1911, 91,238 births, and 51,648 deaths. Primary education is free and com-

pulsory; there is a university at Helsingfors.

PRODUCTION. The crown forests in January, 1913, covered 12,616,000 hectares. In 1911 there were 175 saw mills, giving occupation to 24,743 workers; aggregate production, 3,740,000 cubic meters of timber. Cost of maintenance of crown forests for the year 1911, 2,850,959 marks; income, 13,239,900 marks. The yield of agricultural products was 49,503 hectoliters of wheat in 1911; 3,317,500 of rye in 1911; and 4,357,100 in 1912; barley 1,739,000, and 2,382,000; oats, 6,683,500, and 9,383,400; potatoes, 6,497,100, and 8,277,100; flax and hemp, 11,589 tons in 1911. Horses in the country numbered 297,648 over three years of age at the end of 1911, and cattle 1,187,974 over two years. Production of iron ore in 1911, 2358 metric tons; pig iron, 8788; bar iron, 33,542. Employed in manufacturing industries were 97,222 work people; value of output, 615,122,300 marks, exclusive of flour.

COMMERCE AND COMMUNICATION. The trade (external) for three years is given in the table below in Finnish marks.

	1910	1911	1912
Imports	384,089,000	444,504,000	420,032,000
Exports	290,142,000	319,550,000	370,040,000

Some of the principal articles of import for consumption and exports of domestic produce are seen in the table below in thousands of marks.

Imports	1000 m.	Exports	1000 m.
Cereals	87,300	Timber	166,200
Machinery	28,200	Paper and pulp	64,100
Iron and mfrs.	25,400	Butter	34,900
Coffee	24,400	Hides and leather	12,600
Minerals	20,000	Wooden wares	7,200
Sugar	19,900	Fish	5,500
Hides and skins	18,900	Cotton textiles	4,800
Cotton	16,100	Iron	1,500

The principal countries of origin and destination in the 1912 trade were Germany, with 186,800 thousand marks imports, and 48,200 thousand marks exports; Russia, 131,100, and 98,400; Great Britain, 68,300, and 87,600; Sweden and Norway, 26,000 and 15,100; Denmark, 25,200, and 11,700; France, 7500, and 28,200; the Low Countries, 15,700, and 32,600.

Vessels entered in the 1912 trade, 10,020, of 2,929,793 tons; cleared, 10,090, of 2,927,371 tons. Merchant marine Jan. 1, 1913, 3425 vessels, of 392,408 tons. Railways in operation January, 1913, 3763 kilometers.

FINANCE. The details of revenue and expenditure for the year 1912 are shown in the table below in thousands of marks:

Revenue	1000 m.	Expenditure	1000 m.
Customs	57,096	Communications	48,535
Railways	53,480	Instructions, etc.	16,187
Domains, etc.	16,280	Administration	14,303
Excise	13,501	Military	13,161
Posts	7,891	Debt	8,474
Lighthouses	1,369	Justice	5,454
Land tax	3,625	Forests, etc.	5,519
Personal tax	2,309	Pensions, etc.	5,250
Interest	1,963	Agriculture	7,469
Stamps	4,169	Commerce, etc.	7,193
Hospitals	982	Government	8,025
Industrial tax	582	Customs, etc.	3,834
Fees	452	Printing, etc.	772
Canals	984	Diet	681
Other ordinary	6,631	Russian contribution	480
Extraordinary	1,028	Other ordinary	5,121
		Extraordinary	20,854
Total	172,844	Total	166,262

The debt stood Jan. 1, 1913, at 174,640,334 marks.

GOVERNMENT. The Emperor of Russia is the grand duke, who summons and may dissolve the diet. This body, which is unicameral, is chosen by direct proportional election, the suffrage being possessed by each citizen (with the usual exceptions) who has reached his or her 24th year. Every voting citizen is eligible to the diet, to which at the first election, in 1907, 22 women were elected. The diet, which lasts for three years unless sooner dissolved, has power to enact legislation which does not affect the fundamental laws or the organization of land and sea defense. The grand duchy is included in the Petrograd military district. The executive, at the head of which are the governor-general and the Russian secretary of state for Finland, is responsible both to the grand duke and to the diet. Until the present régime Finland enjoyed the autonomy guaranteed her in the reign of Alexander I. Latterly the Russification system has been applied to an increasing number of departments; by the end of 1912 the constitution was virtually annulled, and the diet is little better than a figurehead.

HISTORY. After eight months of solitary confinement in St. Petersburg prisons, the 16 Finnish judges were allowed to return to their native land, but not to hold any office again before 1924. The 16, it will be remembered, had been cast into prison for refusing to recognize the validity of the Equality Law passed by the Russian government in 1912, but never sanctioned by the Finnish Diet as provided by the Finnish Constitution. A series of other measures had been imposed upon Finland without the consent of the diet—measures prescribing the use of the Russian language in the Finnish courts and public offices, giving Russian courts jurisdiction over political offenses committed in Finland, bringing Finland under the Russian

tariff system, and depriving Finland of the two Viborg parishes of Nykyrka and Kivinebb. All were incidental to the policy of Russifying Finland. But the Equality Law of 1912 was especially detested because, by removing certain qualifications of the Finnish law for office-holders, it enabled Russians to hold office in Finland, and thus prepared the way for Russian bureaucracy. Every Finnish official felt that his own tenure of office, as well as the liberty of his compatriots, was menaced. Many Finnish magistrates were punished for resisting. Finally all of the 16 judges of the Finnish Court of Appeals at Helsingfors were imprisoned. Their release, which took place in 1914, was enthusiastically celebrated by the townspeople of Helsingfors—so enthusiastically, indeed, that the Russian mounted police had to flog the people with whips in order to clear the streets.

FIRE DAMP INDICATOR. See **CHEMISTRY, INDUSTRIAL.**

FIRE INSURANCE. See **INSURANCE.**

FIRE PREVENTION. See **FIRE PROTECTION.**

FIRE PROTECTION. The importance of fire protection and fire prevention in the United States continued to attract attention during 1914. The various agencies concerned were active in the campaigns for more thorough inspection, and the enactment and enforcement of proper legislation. The National Board of Fire Underwriters through its committee on statistics and origin of fires, on May 28, 1914, published its annual report, which gave comparative fire losses for the United States and Canada as well as for the leading European and Asiatic cities. The disparity in total and per capita losses between American and other countries was strikingly illustrated by these figures which are summarized in the accompanying tables.

STATISTICS OF FIRES IN AMERICAN CITIES, 1913

	Area Sq. m.	Popula- tion	No. of Alarms	Total No. of Fires	Confined to Building or Place of Origin	Total Loss	No. of Fires per 1000 Pop.	Loss per Capita
New York	810.20	5,476,996	14,787	12,959	12,727	\$7,476,997	2.37	\$1.36
Chicago	195.5	2,450,000	14,688	8,675	8,288	5,518,287	3.54	2.25
Philadelphia	129.5	1,650,000	4,096	8,651	8,532	2,189,876	2.21	1.33
St. Louis	61.37	775,000	5,316	4,705	4,688	1,843,489	6.07	2.38
Boston	47.85	785,399	4,947	8,807	3,772	4,254,848	5.18	5.79
Cleveland	51.83	650,000	3,195	2,638	2,545	848,032	4.06	1.30
Baltimore	38.33	600,000	1,978	1,908	1,895	1,106,864	3.18	1.84
Pittsburgh	40.67	565,000	2,057	1,949	1,929	732,000	3.45	1.28
Detroit	41.5	550,000	3,282	2,865	1,629,604	5.21	2.96
Buffalo	42	440,000	2,185	2,185	2,171	1,043,758	4.97	2.37
San Francisco	38.87	430,000	2,594	2,399	2,282	977,181	5.58	2.27
Cincinnati	63.68	400,311	2,320	2,243	1,083,181	5.63	2.71
Newark	23.5	390,000	1,247	1,065	1,008	809,926	2.73	2.08
New Orleans	196.25	350,000	748	727	680	513,242	2.08	1.47
Washington	70	350,843	1,245	1,159	1,106	493,617	16.56	1.41
Los Angeles	121	365,000	2,456	2,195	2,109	1,347,260	6.01	3.69

COMPARATIVE FIRE LOSSES

	Number of Cities Reporting Loss			Population			Per Capita Loss		
	1911	1913	1913	1911	1913	1913	1911	1913	1913

AMERICAN FIRE LOSSES IN 1914. The losses by fire in the United States and Canada during 1914, as recorded by *The Journal of Commerce and Commercial Bulletin*, of New York City, aggregated \$235,591,350, or nearly \$11,000,000 more than in the preceding year. This was the heaviest loss to property by fire in North America with three exceptions, namely: 1908, the year of the Chelsea, Mass., and three other conflagrations; 1906, the year of the San Francisco conflagration, and 1904, the year of the Baltimore conflagration. The fire losses of 1914 were increased by the Salem, Mass., conflagration, costing \$13,000,000, but averaged moderate until the last two months of the year, when the general burning ratio increased extraordinarily.

The only big conflagration during 1914 was at Salem, Mass., but there were no less than 46 fires each causing an estimated property damage of \$500,000 or over. These fires, with losses, were as follows:

Montreal, Que., wholesale hardware store..\$	500,000
Brooklyn, N. Y., dried fruit warehouse . . .	500,000
Manchester, N. H., business block	500,000
Clinton, Tex., cotton compress and yards . .	1,000,000
Chicago, Ill., grain elevator	900,000
St. Louis, Mo., rubber works and other . . .	500,000
Big Island, Va., paper mill	500,000
Waco, Tex., cotton warehouse	500,000
Portland, Ore., dock, steamship and ware- house	1,000,000
Wellesley, Mass., college buildings	900,000
Vancouver, B. C., wholesale grocery and other	600,000
Durham, N. O., several business houses . .	875,000

St. Augustine, Fla., hotels and other . . .	650,000
Decatur, Ill., department store	750,000
St. Andrew, N. B., hotel and stores	500,000
Aberdeen, Ont., paper mill	500,000
Pasadena, Cal., hotel and other	500,000
Washington, D. C., high school laboratory..	500,000
Curtis Bay, Md., fertilizer plant	650,000
Houghton, Mich., foundry	500,000
Louisville, Ky., tobacco warehouse	900,000
Galveston, Tex., cotton compress and cotton	
Cleveland, O., lumber yard and other . . .	1,250,000
Dover, N. J., stove works	500,000
Salem, Mass., conflagration	18,000,000
Three Rivers, Que., pulp mill and other . .	500,000
Chicago, Ill., cooperage and other	500,000
Newton, Kan., auditorium and other . . .	500,000
Carlton, Ore., lumber plant	500,000
Aurora, Ill., chemical plant	500,000
Tacoma, Wash., meat packing plant and other	1,000,000
Newark, N. J., chemical plant	500,000
Paterson, N. J., pipe works	500,000
Carson, La., lumber plant	500,000
Ringling, Okla., oil field property	500,000
Pittsburgh, Pa., hardware store and other .	500,000
Lake Charles, La., saw mill and lumber . .	500,000
Portland, Ore., steamer and cargo	700,000
Beaumont, Tex., hotel and stores	500,000
Jeannette, Pa., glass factory warehouse . .	1,000,000
Farmville, N. C., cotton warehouse, etc..	600,000
Galveston, Tex., grain elevator	1,000,000
Ardley, N. Y., business section	500,000
West Orange, N. J., electrical and film man- ufacturing plant	1,250,000
Port Griffin, Pa., coal breaker	500,000
Pottsville, Pa., several business blocks . .	800,000

During the 38 years ended 1914, the property destroyed by fire in the United States and Canada reached the total value of \$5,866,981,025, equal to an average annual loss of \$154,394,237.

The accompanying table, giving the losses by years during this period, indicates the steady enlarging tendency of the country's fire waste, notwithstanding all the efforts to induce better building construction and more real endeavor for fire prevention:

FIRE LOSSES DURING THIRTY-EIGHT YEARS
AGGREGATE \$5,866,981,025

1914\$235,591,850	1895\$129,885,700

PERSONAL LIABILITY FOR FIRES. A somewhat novel case in American practice was that before the courts of the State of New York during the year 1914, involving the personal liability of the owner of premises, for fire which had occurred after the fire department had ordered the installation of sprinklers or other requirements, which orders the owner had neglected. The fire commissioner brought suit to recover the cost of putting out a disastrous fire, and was able to recover damages, being sustained in his position by a higher court. This follows somewhat European practice, and was considered an important development of the year and one likely to strengthen the fire department in its work of fire prevention, through compulsory installation of suitable appliances, such as sprinklers, etc. Somewhat similar action was being taken in Massachusetts and further developments along this line were promised.

HIGH PRESSURE FIRE SYSTEM FOR BOSTON. While Boston, Mass., was one of the first cities in the United States to lay a separate pipe-line solely for fire protection purposes, it had not pursued this plan as actively as other cities. The original fire main referred to was but one mile of pipe, which was supplied with salt water from the harbor, pumped by fire boats. A large fire on Aug. 9, 1910, required the use of 41 fire engines, while at the same time 16 fire engines were engaged at a second-alarm fire, and 15 engines from adjoining cities rendered aid to the firemen. This emphasized the need of additional protection and it was determined in the following year that a high pressure fire service branch of the water service should be organized, with the result that after plans had been prepared the laying of pipes was begun August, 1914. The area to be protected by this system contains about 550 acres, comprising the whole of the 335 acres, termed by the underwriters the congested value district, and the adjacent territory, through which it was necessary to lay pipe to serve the high value area. The plan devised gives a system with a capacity of 20,000 gallons of water per minute on any single block, and 10,000 gallons of water per

minute in any single building. The pumping stations will be operated by motor-driven centrifugal pumps, with electrical energy supplied over duplicate service lines from the power plant of the Edison Electrical Illuminating Company, and were to be located near Fort Point Channel in the vicinity of the South Terminal Station. New mains will be run to the station to supply water needed in the high pressure service. Each pump will be capable of delivering 3000 gallons per minute at a pressure of 300 pounds per square inch, and a duplex distribution system composed of two independent sets of mains on alternate streets was designed, similar to that employed for the lower section of the New York high pressure service. This was to require about 13 miles of pipe from 12 to 20 inches in diameter, and cast iron pipe is used with a special bell and spigot joint, made with an alloy of 96 per cent lead and 2 per cent antimony and 2 per cent tin. All pipes after laying were to be tested at 400 pounds per square inch, and the leakage must not exceed one-half gallon per linear foot of pipe joint for 24 hours. The mains were to be equipped with gate valves so that a break in a pipe would not put out of service more than three hydrants, each valve being placed at a manhole large enough to permit access for maintenance and repairs. About 450 hydrants specially designed by the Public Works Department of Boston were to be placed within the area protected with one hydrant to each 40,000 square feet of area, so that through hose lines of moderate length, the entire capacity of the city could be concentrated. This new system is an important development in the fire protection of Boston, and one that will diminish materially conflagration hazards.

SALEM CONFLAGRATION. The most notable conflagration of the year occurred at Salem, Mass., June 25 and 26, 1914, in the course of which 1600 buildings were destroyed in 13 hours, and 253 acres laid in ruins. The direct loss amounted to over \$14,000,000, and of this \$11,700,000 represented insurance. The fire started in the Korn Factory and rapidly spread throughout the city, the construction of the buildings being such that all conditions were favorable for the rapid progress of the fire although the wind was light. The fire departments from the adjoining cities were called upon, and the water supplies of Peabody, Danvers, and Beverley were connected with the Salem system, but the lack of strength of the mains prevented the full utilization of the additional water supplies, while the bursting of pipes restricted the full use of the water. Furthermore, the companies from the adjoining cities were unable to couple their hose lines to the hydrants because of non-standard, non-uniform, hose couplings, and hydrant connections. In this conflagration the motor apparatus demonstrated not only its increased mobility but the increased convenience and advantage of being able to carry and use liquid fuel instead of requiring wood fences and box boards as was the case with the steam fire engines. A large number of people were rendered homeless through this conflagration, and the militia was summoned to preserve order and to supervise the assigning of shelter and the distribution of relief.

EDISON FIRE. One of the notable fires of the

year was that which took place at the plant of Thomas A. Edison, Inc., at West Orange, N. J., the evening of Dec. 9, 1914. The great amount of damage in this fire aroused interest which was increased by the fact that the concrete buildings, forming a large portion of the plant, were considered fire-proof, yet while the walls remained standing, there was considerable damage done to the buildings as well as the contents. The fire demonstrated once more, that a fire-proof building will act as a stove, if filled with inflammable contents, and that local fire protection and fire resisting walls are as essential as in buildings more combustible, while wooden window sashes and plain glass should be eliminated entirely.

The fire totally destroyed one frame and six brick buildings, but seven concrete buildings remained standing, while the storage battery plant across the street was not damaged. The reasons given for the extent of the disaster and the rapidity of the progress of the fire were the highly inflammable character of the contents of the buildings, and the inadequacy of the water supply. The use of wooden sash and plain glass at the window openings, the lack of fire walls, and the lack of automatic sprinklers, were other contributing causes.

In connection with this fire the preliminary report of Ira H. Woolson, Engineer of the National Board of Fire Underwriters, to that body made shortly after the fire, was of special interest. Professor Woolson refers to the fact that while the concrete structures were seriously damaged, there was no reason why confidence should be lost in buildings of this type. The Edison buildings he stated were in many respects not well constructed, and while the concrete on the whole was of fair quality, considerable variations existed in both quantity and quality of the aggregate used, and this irregularity in composition may have contributed to the failure of the concrete. He criticised the arrangement and the placing of the reinforcement, and at the preliminary examination it could not be determined whether it was due to faulty design or careless workmanship, as a sufficient number of properly tied rods had not been employed, and as there were no single ties to be noted around the vertical rods. The lapings of the rods were carelessly tied down, the reinforcement in the beams improperly spaced, very few stirrups were used, and other defects were noted, which would not be permitted in modern first class reinforced concrete construction. These defects, coupled with the rapid expansion of the structures due to the quick hot fire, were undoubtedly the cause of the failures in the concrete. Professor Woolson noted that a square type of column was not suited to withstand fire, and that if well fastened, round, hooped, columns had been used, the results would have been different to the columns.

PANAMA-PACIFIC EXHIBITION. A central fire and police system was installed during the year in the buildings of the Panama-Pacific International Exposition, consisting of 102 fire alarm boxes, installed throughout the grounds and buildings. These boxes were absolutely non-interfering and successive, and so constructed that nine boxes could be pulled simultaneously and all of them would register in succession their respective signals. The system embraced a central, and full automatic equipment con-

sisting of a 12-circuit switchboard, and an 8-circuit automatic repeater, with 4 local engine house circuits, a signal wheel transmitter, used for transmitting special alarms, a punching register, take-up reels, and an automatic time stamp for recording the exact time when an alarm comes in, the stamp being controlled by a self-winding clock. In addition to the fire alarm boxes, there were 102 seven-call company police telephone and signal boxes, which were mounted on ornamental iron pedestals, surmounted by a red globe on which was etched "Fire Alarm" in white letters. By means of a signal wheel transmitter operated by an electric motor in the central office, code signals could be conveyed from these alarm boxes at night to notify the guards that their services were required.

FIRE-PROOF ICE-HOUSES. While the natural ice industry has made little progress in comparison with the artificial, yet fire-proof ice-houses were beginning to take the place of wooden structures among the larger and more progressive companies. The Mountain Ice Company at Lake Hopatcong during the year built a tile and steel building, which not only was fire-proof, but provided increased advantage in the way of insulation. It enabled 90,000 tons of ice to be stored in a building 350 feet wide by 326 feet long, in 10 separate storage rooms, and was provided with modern conveying and transportation machinery, so that the ice could be handled economically and with great facility. The exterior walls were double with an interior space of about 16 inches filled with sawdust up to the loft floor.

PREVENTING VILLAGE FIRES. During the year the National Board of Fire Underwriters and the National Fire Protection Association published an ordinance intended for the use of small towns and villages, providing for fire limits and the construction and equipment of buildings. This suggested legislation represented the best practice in building construction, with special reference to the needs and proper protection of small towns, and was designed to prevent hazardous practices and serve as a reasonable regulation of ordinary building construction in places where there was no abnormal congestion of values. The suggested ordinance deals with the limits of height of buildings within the stated fire lines, limit of floor area, the construction of stair and elevator shafts, and means of exit, and the construction of smoke-proof towers or stairways, and in fact summarizes the best building practice that is suitable for smaller cities where the more elaborate regulation and inspection is hardly possible.

RAILWAY FIRE PROTECTION. The Railway Fire Protection Association, which was formed in 1913, held its second annual convention at Washington on October 6 and 7. The object of this society is to devise practical, economic, and effective ways and means for the protection of, and the prevention of fire loss to railway property, and to develop standard practices and authoritative measures that will commend themselves to operating officials. During the year the Committee on Fire Hazards published six bulletins which dealt with such subjects as the Construction of Buildings, Care of Property, Lighting, Heating, and Power, the Hazard of Locomotive Sparks, Recommendations in Connection with Chimney Flues and Furnaces, Im-

proved Construction of Boiler Houses, Boiler Settings, and Boiler Stacks, the Storage of Railway Fuses and Torpedoes, and the Storage and Handling of Oil Supplies. The association also has a committee on statistics and forms, several of which were recommended for adoption. This committee reported that in an investigation covering five years and a mileage varying from 27,396 in 1909 to 39,576 in 1913, there have been 10,160 fires, the total loss in which, including railroad property and lading liability, being \$5,840,644, an average of \$574.86 per fire. The necessity of forming fire fighting brigades and regular controls by railroad employees was emphasized in the report of the committee on fire-fighting organization, while a report on fire-fighting apparatus treated the regular apparatus used or needed at regular freight and passenger stations, as well as at coaling stations, and on engines and cars. This report summarized the fire-fighting practices generally followed on most roads and made recommendations for various improvements.

FISH AND FISHERIES. The report of the United States Commissioner of Fisheries for the fiscal year ending June 30, 1913, appeared in December, 1913, and was the last report available at the time of preparing this article. The report was, as usual, an exhaustive account of the work of the Commission, and should be consulted for detailed information. During the fiscal year 1913, there were distributed of fish, 422,275,973 eggs, 3,421,591,295 fry, and 19,726,114 fingerlings, yearlings, and adults. These were sent to 25 of the United States, to British Columbia, Canada, Germany, India, and Japan. Because of the scarcity of breeding lobsters along the southern New England coast, no attempt was made at hatching them at Woods Hole. Farther north, however, conditions were more favorable, and this work was continued at Gloucester. Maine fishermen reported an increase of lobsters along that coast. The Commissioner emphatically urged the extension of fish cultural work, especially in the oyster industry, pointing out the fact that while oysters have very great economic value, less is spent on their propagation than on the black bass, which are used chiefly for sport.

The condition of the shad fisheries in Chesapeake Bay was reported as unsatisfactory, not enough fish to keep the number constant being allowed to pass the seines each year. Similar injudicious fishing has ruined the sturgeon industry, the only apparent remedy being to prohibit fishing for at least 10 years. The Rumanian government has offered to send fish for restocking from the Danube River and Caspian Sea, and this offer may be accepted. Because of the impossibility of enforcing regulatory laws, the Florida sponge fisheries have practically been worked out, and are now of relatively little importance.

The fish landed at Boston and Gloucester in American vessels, amounted for the fiscal year 1913, to 182,704,059 pounds, with a total valuation of \$4,779,259. From March, 1912, to April, 1913, 30,373,396 pounds of salmon, having a value of \$2,207,109 were landed at Seattle, Washington.

The report on the oyster fisheries covered the year 1910 for the New England and South Atlantic States; the year 1911 for the middle Atlantic (except Maryland and Virginia); and

the year 1912 for Maryland, Virginia, and the Pacific Coast. The total was 32,988,815 bushels, having a value of \$15,377,983. For data concerning other fisheries of less value, and for details of the different fisheries, the original report should be consulted.

In 1908 the total value of United States fishery products (excluding Alaska) was \$54,030,630. In 1914 the value of Alaskan fishery products exported amounted to \$19,027,970. There were in 1913, 21,721 persons employed, and 444 ships, aggregating 93,800 tons.

In England, early in the year, was started a campaign of education among the fishermen, covering not only instruction in the more practical side of the fishing, but also in the theoretical aspects of fish culture. The value of the 1913 fisheries in England and Wales as reported in June, 1914, was £10,337,000. After the breaking out of the war, however, all fish cultural work in England was partially or entirely discontinued, and the North Sea fishery industry has practically been destroyed. For the same reason the work of the "Conseil Permanent International pour l'Exploration de la Mer" has been discontinued. In one of the last reports of this Conseil, Hjort recorded some observations which seemed to him to be of very great practical importance. It is already well known that the age of a fish can be told by counting the rings on its scales. Using this method of determining the age of herrings, Hjort found that more than 50 per cent of the various sizes of herrings taken up to as late as 1914 were of the 1904 hatching. From this he concludes that the renewal of the fish population is not kept up by an annual increase but that periodically there is a year of unusual increase, followed by a number of years when the number is less. Thus it may be possible to predict at any time, the probable course of the fisheries for a number of years in advance.

From New South Wales it was reported that the California Rainbow Trout had been acclimatized there, and that young had been reared.

FISHER, JOHN ABUTHNOT, FIRST BARON. See WAR OF THE NATIONS.

FISHERIES. See section so entitled under various countries and States of the United States.

FISKE, WILLIAM F. An American entomologist, died in 1914. He was born at Webster, N. H., March 20, 1876, and was educated at the New Hampshire College of Agriculture and Mechanical Arts. He was successively assistant entomologist at the New Hampshire Experiment Station (1897-1901); assistant entomologist for the State of Georgia (1901-03); assistant in forest investigations (1903-06); in charge of the Gypsy Moth Laboratory, Melrose Highlands, Mass., in May, 1906; and afterwards in the Bureau of Entomology, United States Department of Agriculture, Washington. He was a member of the American Association for the Advancement of Science, American Society of Economic Entomology, Boston Society of Natural History, and various other entomological and natural history societies.

FISK UNIVERSITY. An institution of higher education for the colored race, at Nashville, Tenn., founded in 1866. The enrollment in all departments of the university in the autumn of 1914 was 477. Of these, 156 were in the college department, 155 in the preparatory school,

and 123 in the training school. During the year Dean C. W. Morrow was appointed acting president. The productive funds amounted at the end of the year 1913-14 to \$130,745, and the income from endowment to about \$5000. The library contains 11,000 volumes.

FLAX. The world's average annual production of flaxseed is about 100,000,000 bushels, and of flax fibre over 1,000,000,000 pounds. However, as high as 130,000,000 bushels of linseed, and over 2,000,000,000 pounds of fibre have been produced. Although estimates of the production in 1914 were lacking, as the result largely of the disturbed political conditions in Europe, the figures at hand indicated a smaller crop than in 1913. The production of flaxseed in British India in 1914 was estimated at 15,300,000 bushels, in Rumania at 150,000 bushels, and in Italy at 315,000 bushels. Based on the crop of 1913, the production of British India was 71 per cent, of the United States 94 per cent, of Canada 43 per cent, of Italy 78 per cent, and of Rumania only 28 per cent. For Russia, which ranks with the United States, Argentina, and British India as the principal linseed producing countries, data were not available. Argentina produced in the crop season of 1913-14, as estimated by the Argentine Ministry of Agriculture, 38,974,000 bushels on 2,614,000 acres. The Canadian crop of 1914 was much injured by drouth in Saskatchewan, the principal producing province, and was reported as only 7,535,000 bushels, the average yield per acre being about 7 bushels. Estimates published by the Department of Agriculture placed the flaxseed crop of the United States in 1914 at 15,559,000 bushels, the acreage at 1,885,000 acres, and the average yield per acre at 8.3 bushels. The total value of the crop based on a bushel value of \$1.26, the price received by farmers on December 1, was given as \$19,540,000. As compared with 1913 this is a reduction of 406,000 acres in area, of 2,294,000 bushels in yield, and of \$1,859,000 in farm value.

PLEAS. See INSECTS AND THE PROPAGATION OF DISEASE.

FLOOD PREVENTION. The recent prevalence of serious and disastrous floods such as those in 1913, and in earlier years, not only in the United States, but in Europe and Asia, attracted increased attention to methods for the prevention or minimization of their effects. In the year 1914 important investigations were in progress, and remedial measures undertaken, the more important of which are briefly summarized below.

During the year a report of the special board of the Corps of Engineers, U. S. Army, was submitted by the Secretary of War to Congress. This board, appointed April 12, 1913, consisted of Lieut. Col. F. R. Shunk and Henry Jervey, Maj. Charles S. Bromwell, John C. Oakes, Frederick W. Alstaetter and Louis H. Rand, and the report, abstracted in the *Engineering Record*, for May 2, 1914, is an important and valuable document. It pointed out that in flood prevention reservoirs, both impeding and storage, as well as unobstructed channels were all proper methods of river regulation, but that the application of any or all of these methods must depend on local conditions and a careful study of the problems. One of the general causes of floods, such as those that occurred in the Ohio Valley in 1913, was the obstructions in the river

channels, and a large amount of damage was due to the fact that buildings were knowingly erected and inhabited in territory subjected to inundation by high water. The conclusions of the board were that forestation and special methods of plowing were not usually productive of practical results, to an extent that would make it profitable to consider their employment. Reservoirs could be used where good sites were obtainable at reasonable cost, and prompt and certain relief would be afforded by moving structures and bulky material out of the flood area, while by removing river obstructions flood heights and velocities could be reduced greatly. This last method should be adopted so far as is practicable, and new obstructions should be prevented. Further auxiliary channels failing, parallel channels and cut-offs could be used in certain cases, as well as properly designed levees. No one method of flood control could be recommended to the exclusion of others, and each locality must be considered separately to determine the best plan.

It was the opinion of the Mississippi River Commission and of the Chief of Engineers of the United States Army, that the only practicable method of flood protection in the lower Mississippi Valley was by the construction of an adequate system of well-designed levees, supplemented by bank production. This question was actively discussed during the year and many varying opinions were held. In Sacramento Valley, California, the project for flood protection involved an extensive use of auxiliary channels, while at Galveston, Texas, the flood protection had been secured by raising the grade of the city. The Army Board of Engineers emphasized the fact that when a definite project had been prepared it could be undertaken without new and expensive organization, and that when an appropriation was required, conditions were such that it could be presented to Congress for its consideration in an intelligent, concise, and concrete manner. This, of course, brings up the question of the necessity and distribution of such public works, and the fact that such necessary improvements might fall in the same class as the River and Harbor work, for which for many years appropriations have been made by the government, but which confessedly have not been so distributed that the projects could be carried on with the greatest harmony and economy, as would appear with engineering work organized on a different basis and not dependent on the votes of the National Legislature.

In the above connection an important paper on "Methods of Flood Prevention" was presented April 21 before the Engineers' and Architects' Club of Louisville, Ky., by Maj. John C. Oakes, C. E., U. S. A., and is abstracted in the *Engineering News* for May 7, 1914. Major Oakes discussed the work of the National government and especially of the Army Board of Flood Prevention, which, after the great floods of 1913, had been actively investigating the problem in the Ohio River basin and elsewhere. He discussed the proposals of the Pittsburgh Flood Commission and of other agencies, and states that before any plan should be adopted involving as it would immense expense, the whole situation thoroughly should be canvassed. In discussing the construction of reservoirs, which many authorities advocated, he referred to the small value of undeveloped water power and the

conflict between the use of reservoirs for flood storage, and for power development and maintenance of low water flow.

In distinction to the work of the National government local schemes were also discussed. Shortly after the Ohio River valley flood of March, 1913, the Dayton Flood Prevention Committee called in consulting engineers to devise some plan whereby protection from further catastrophes might be insured. The Morgan Engineering Company of Memphis, Tenn., in cooperation with D. W. Mead, J. W. Alvord, and S. M. Woodward, consulting engineers, after careful study determined that the best solution of the problem was a reservoir or detention basin system, and this decision was approved by a special board of consulting engineers, composed of retired United States Army Engineers, and other well-known authorities in hydrographic and river engineering. This board decided that floods as great as that of 1913 were liable to occur at any time, and that prevention measures should be undertaken to control floods even 20 per cent greater than that of 1913; that the enlargement of the river channel of the Miami Valley alone was impracticable as a permanent flood protection; and that a detention basin supplemented by limited channel improvements offered a solution of the problem. The flooded area of the Miami Valley, above the White River, should be considered as a unit in working out any such plan, and the works should be constructed so massive and substantial as to justify confidence in their integrity, and satisfy every reasonable question of suitability. This interesting report was summarized in the *Engineering Record* for Aug. 8, 1914, and deals with the various remedial measures that have been proposed as well as the plans suggested. The detention basins proposed would be constructed through the use of river dams with spillways of ample proportions, excavated in and founded upon solid rock, while there should be ample outlet conduits or tunnels to pass the ordinary flow, without any accumulation behind the dams. The cost of the completed scheme of flood protection by channel deepening and widening alone for the entire river would probably amount to about \$100,000,000, but by the system of detention basins, with limited channel improvements, the cost would probably be placed between \$18,000,000 and \$20,000,000, with a comparatively light cost of maintenance. As it is, there would be involved in the channel enlargement and improvement not only the excavation, but the moving of existing buildings, the readjustment and rebuilding of sewerage systems and pipes, changing the grades of the streets or repairing the streets and sidewalks, and the reconstruction of railway and highway bridges.

An interesting paper dealing with flood prevention was presented during the year by Sir William Willcox, the eminent English engineer who constructed the Assuan Dam and other Egyptian engineering projects, and was engaged in the work on the Euphrates. The title of the paper was "How the Ancients Would Have Controlled the Mississippi and Its Tributaries." He treats in a dispassionate way the conditions existing on the Mississippi River, as described by reports and observations; and then from his observations in Mesopotamia and elsewhere discusses the method that would have been employed by early workers. He believes they would

have protected the salient bends, and there would have been precautions to avoid the breaking away of the levees; that cut-offs would have been allowed by ancient engineers, and they would have prevented the river cutting away inside the channels. The English engineer also believed that reservoirs on the Mississippi River were needed, and that various basins should be used, and that the upper quarter of the St. Francis basin should be protected with levees, permitting three-fourths of this basin to be put under water, so that it would protect the Mississippi River until the river had widened its channel. In the meantime transverse dikes could be built from the river to the hills, just as was done by the ancient Egyptians, so that the muddy waters of the Mississippi would flow over this basin, improving the land and making it richer in the future. Sir William Willcox's paper dealt not only with the flood situation in the Mississippi River, but up the Ohio valley as far as Pittsburgh, and it aroused considerable discussion, not all of the ideas of the European engineer being approved by American workers in this field.

Previous to the outbreak of the war, the City of Paris voted \$7,000,000 for its share in the work of flood prevention, recommended by a special commission appointed by the State after the 1910 inundation. The exact nature of the improvements to be undertaken had been a matter of controversy between various engineering authorities, and also between the state and the municipality and the Seine Department, as there was a considerable divergence of views, and the work was of enormous scope. An agreement was finally reached between the city and the minister of public works in December, 1913, for a plan which involved the enlargement of the Seine arm and the deepening of the river at Suresne, as a beginning of operations for which the municipality formerly engaged to furnish \$7,000,000, one-half of the amount needed, the other half to be supplied by the State. There was being considered in the National Assembly a diversion canal for the Marne River, while the municipality decided to carry out an extensive programme for increasing the height of the Seine embankments above the 1910 freshet level at a cost of \$4,400,000, and to erect temporary barges at other points, where the immediate need of such protection existed. Previous to the outbreak of the war, some of the plans for this work were being drawn and in some cases work had actually been started. In this connection also various urgent work on pavements, water-piping, and sewers was undertaken, and that this was quite necessary was demonstrated by the flood of June 15, 1914, which undermined a portion of the city, especially the streets involved in the underground working and excavations for the new subways. Much damage was done by extensive cavings in of the streets, and it was realized that the sewer system was inadequate to take care of the flood resulting from such a violent storm as occurred on June 15. These and other improvements were being undertaken in connection with new subway construction, and at the same time the Police Department organized a system of mobilization, so as to bring help to all threatening points along the river at the time of the first alarm. Considerable work of investigation was also done with a system of absorption wells, for draining the output of the

river, and some engineers reported that it would be advantageous to use the soil as a reservoir for surplus water.

During the year an interesting report on flood prevention in China was made by a board of American engineers composed of William L. Sibert, Daniel W. Mead, and Arthur P. Davis, appointed by the American National Red Cross, in accordance with an arrangement with the Republic of China. From time to time the Huai River, the Yellow River, and other streams in China have overflowed or changed their direction and the resulting floods have caused widespread destruction of life and property, this having been a serious problem for China for more than ten centuries. The board recommended a project for the Huai River conservancy district, which would involve the expenditure of \$30,000,000, and which would require six years to complete. This conservancy district is divided into two parts separated by the old channel of the Yellow River. The river's drainage basin lies in the southern half of the great plain of Eastern China, which occupies a semicircular area 600 miles in radius. The Yellow River is engaged in developing a normal delta plain, while the Chinese are attempting to confine this stream within limited bounds, so that they may cultivate as much as possible of Eastern China and support thereby a comparatively dense population. Thousands of lives have been lost by drowning, and all attempts to mitigate the destruction have been practically without avail. The board of engineers was of the opinion that it was not feasible to attempt to divide the waters of the Huai River, but that they should go into the Yangtze near Chinkiang, and that such waters should be diverted into Paoying and Kaoyu Lakes, so as to make possible the reclamation of Hungtse Lake with a channel constructed across it with high dikes, through which can be passed to Paoying Lake the waters of Huai and the drainage waters from a large part of the territory annually flooded, bounded by Hungtse Lake, the old Yellow River bed, the Tientsin-Pukow Railway, and the Huai River below Pengpu. This would involve considerable dike construction with regulating works, and an extensive system of canals and laterals whereby a large section of the country would be irrigated. As considerable land would be reclaimed or benefited, the value aggregating an amount of some \$48,000,000, and the grand canal and other canals would return increased revenues, while there would be additional taxes on the land, it was believed that the project was feasible commercially.

FLORIDA. POPULATION. The estimated population of the State on July 1, 1914, was 848,111. The population in 1910 was 752,619.

AGRICULTURE. The area, production, and value of the principal crops in 1913-14 are shown in the following table. The figures are from the United States Department of Agriculture, and those of 1914 are estimates only.

	Acreage	Prod. bu.	Value
Corn 1914	700,000	11,200,000	\$8,960,000
1913	675,000	10,125,000	8,302,000
Oats 1914	50,000	900,000	680,000
1913	50,000	900,000	680,000
Rice 1914	400,000	10,000	7,000
1913	400,000	10,000	6,000
Potatoes .. 1914	18,000	1,040,000	1,175,000
1913	12,000	912,000	1,067,000

	Acreage	Prod. bu.	Value
Hay 1914	48,000	a 65,000	1,118,000
1913	47,000	63,000	1,147,000
Tobacco ... 1914	4,800	b 4,800,000	1,290,000
1913	4,000	4,000,000	1,240,000
Cotton 1914	195,000	c 75,000	4,401,000
1913	188,000	59,000	4,792,000

a Tons. b Pounds. c Bales.

MINERAL PRODUCTION. The only importance of Florida as a mineral-producing State lies in its large deposits of phosphate rock. In the quantity and value of phosphate rock produced, it ranks first among all the States, and that item represents 90 per cent of the value of the State's total mineral output. The value of the production approximates \$10,000,000 annually. In 1913 the output amounted to 2,545,276 long tons, valued at \$9,563,084, compared with 2,406,899 long tons, valued at \$9,461,297, in 1912. Land pebble constitutes approximately 80 per cent of the total quantity of phosphate rock produced, but only about two-thirds of the total value. Hard rock is generally of higher grade than pebble, and brings about twice as much per ton to the producers. The total production of hard rock in 1913 was 489,794 long tons, valued at \$2,987,274. The production of pebble was 2,055,482 long tons, valued at \$6,575,810. Florida contributes more than 80 per cent of the total phosphate rock production in the United States. It is also the first State in the production of fuller's earth. It leads also in the production of ball clay, a highly plastic clay used in giving plasticity to the body of better grades of pottery. The manufactured clay products, consisting chiefly of common brick, were valued at \$253,344 in 1913, compared with \$272,766 in 1912. Other mineral substances of commercial importance are limestone, mineral waters, sand and gravel, and building stone. The total value of the mineral products in 1913 was \$10,508,016, as compared with \$10,272,594 in 1912.

FINANCE. The report of the State Treasurer showed a balance on Jan. 1, 1914, of \$1,483,690. The receipts during the year amounted to \$3,429,784, and the disbursements to \$3,390,685, leaving a balance on Dec. 31, 1914, of \$1,522,769. The public debt at the end of the year amounted to \$601,567. It consisted solely of refunded bonds bearing interest at the rate of 3 per cent, all of which are held by the educational funds of the State.

TRANSPORTATION. The total railway mileage at the end of the fiscal year, June 30, 1913, amounted to 5550, an increase of 28 miles over 1912. Of this, 3655 miles was main line, 835 miles yard track and sidings, and 893 miles branches and spurs. The roads having the longest mileage of main line were the Seaboard Air Line, 947; the Atlantic Coast Line, 878; the Florida East Coast, 522; the Louisville and Nashville, 216; and the Georgia Southern and Florida, 152.

EDUCATION. The total school population on July 1, 1912, the latest date for which authoritative statistics are available, was 264,710. The total enrollment on July 1, 1914, was 177,154. The average daily attendance for the same date was 126,565. The teachers numbered 4882, of whom 3808 were females, and 1074 males. The white teachers numbered 3823, and the negro teachers 1059. The average salary of male teachers was \$58.56 per month; of female teachers \$39.70, and of all teachers \$49.13. The Legis-

lature of 1913 passed a measure making an annual appropriation for two rural school inspectors. There was also a law passed granting State certificates to graduates of the University of Florida, and the State College for Women from the collegiate and normal departments; also to graduates of the independent universities and colleges of the State upon certain conditions. A compulsory education bill was introduced in the Legislature, but failed of passage. A similar bill will be introduced in the session of 1915.

CHARITIES AND CORRECTIONS. The State institutions include the Deaf, Dumb, and Blind Institute, the Confederate Soldiers' Home, the State Asylums for the Insane, the State Prisons, and the State Industrial School for Boys. The latter is composed of two schools, one for white, and the other for colored boys. In this institution the average number of inmates is from 175 to 200.

POLITICS AND GOVERNMENT. There was little of political importance in the State during the year. The Legislature did not meet, and there was no election for Governor or important State officers. In the Democratic primaries held on June 8, Sen. Duncan U. Fletcher was renominated, and on November 3 he was reelected practically without opposition.

In the same election S. M. Sparkman of the first district, Frank Clark of the second, and Emmitt Wilson of the third, were reelected to Congress, and W. J. Sears of Kissimmee was elected as Congressman from the fourth district over Claude L'Engle, who had held the position for one term.

State officers were elected as follows: W. A. McRea, Commissioner of Agriculture; W. H. Ellis and T. M. Shackelford as justices of the State Supreme Court; N. A. Blich and R. Hudson Burr as railroad commissioners.

STATE GOVERNMENT. Governor, Park M. Trammell; Secretary of State, H. C. Crawford; Treasurer, J. C. Luning; Comptroller, W. V. Knott; Attorney-General, Thomas F. West; Auditor, Ernest Amos; Adjutant-General, J. C. R. Foster; Superintendent of Public Instruction, W. N. Sheats; Commissioner of Agriculture, W. A. McRea—all Democrats.

JUDICIARY. Supreme Court: Chief Justice, J. B. Whitfield; Justices, W. A. Hocker, R. F. Taylor, T. M. Shackelford, and R. S. Cockrell; Clerk, Milton H. Mabry—all Democrats.

STATE LEGISLATURE, 1915. Both Houses Democratic.

The State representatives in Congress will be found in the article UNITED STATES, section Congress.

FLORIDA, UNIVERSITY OF. A State institution for higher learning at Gainesville, Fla., founded in 1905. The students enrolled in all departments of the university in the autumn of 1914 were as follows: Graduate School, 11; College of Arts and Sciences, 58; College of Agriculture, 73; College of Engineering, 51; College of Law, 77; Teachers College and Normal School, 94. The faculty numbered 51. During the year C. J. McCoy was appointed instructor in gymnastics to succeed G. E. Pyle. N. L. T. Nelson, Ph.D., was appointed instructor in civil engineering to succeed Ira D. Odle. F. M. Rast was appointed instructor in soils and fertilizers to succeed J. F. Duggar, Jr. The university received \$1850 from the general education board. The productive funds amount to about

\$83,028. The university is a part of the educational system of the State, and is supported chiefly by appropriation from the State Legislature. The library contains about 15,000 volumes. The president is A. A. Murphree, LL.D.

FLOUR. See FOOD AND NUTRITION.

FLY, HOUSE. See ENTOMOLOGY.

FOOD AND NUTRITION. **FOOD INSPECTION.** Only 436 cases were reported for prosecution under the U. S. Food and Drugs Act. This reduction of over 50 per cent from the previous year was ascribed in part to a better understanding of the law and the abandonment of many forms of adulteration and misbranding. There were 89 convictions under the meat inspection act, and nearly one-third of the 14,000 imported foods examined were denied entry.

Decisions adverse to the government were rendered in the long-contested "bleached flour" and "Coca Cola" cases. In the former, the Supreme Court held that a food is not adulterated under the law, even though it contains "a small addition of poisonous or deleterious ingredients, . . . if it cannot by any possibility, when the facts are reasonably considered, injure the health of any consumer."

Regulations as to the labeling of package goods were promulgated, taking effect September 3. The use on labels of such legends as "Guaranteed under the Food and Drugs Act" was prohibited after Nov. 1, 1916, on the ground that this practice had misled the public into a belief that the guarantee was by the government.

Massachusetts and Rhode Island were added to the States requiring labeling as to the net weight of packages. Massachusetts also enacted a new sausage law, and Rhode Island provided for meat and butter inspection. New Jersey licensed its egg-breaking establishments, and Maryland began sanitary inspections of canneries, bakeries, creameries, hotels, restaurants, slaughterhouses, and other food-producing enterprises. Rhode Island prohibited misleading claims for the curative properties of drugs, and the Philippines also required patent-medicine labels to show formulas. Canada forbade the terms "maple" and "honey" in mixtures, prohibited all trade in adulterated dairy products, butter substitutes, and renovated butter, and licensed cold storage warehouses holding foods over 21 days, limiting the storage period, and requiring labeling to show the dates in storage.

COST OF FOOD. A general increase in food prices followed the outbreak of the European War. *Bradstreet's* recorded for August 15 the highest commodity index in its history, but decreases followed, and on December 1 the index showed a drop of 1 per cent from the year 1913. Wheat, oats, rye, flour, live cattle and sheep, milk, beef, sugar, molasses, beans, and peas were still higher than in 1913, but corn, pork, eggs, lard, coffee, rice, potatoes, and cranberries were considerably lower. The sharp advance on some commodities in August led to much popular protest, and indictments were obtained in Washington and other cities against jobbers and others for alleged conspiracy.

The conviction became stronger that one remedy for high prices in general, lay in correcting faulty methods of distribution. The Department of Agriculture and the Post Office Department obtained some promising results in developing the parcel post for direct shipments from producer to consumer, and some of the express

companies undertook additional service in this direction. Efforts to organize coöperative selling and purchasing associations made considerable progress, but perhaps the principal discovery of the year was the largeness and complexity of the subject. See AGRICULTURE, *Conservation of Food Supply*.

NUTRITION STUDIES. The U. S. Department of Agriculture worked on the more effective utilization of farm products, as by the drying of cull potatoes, producing citric acid and lemon oil from citrus fruits, and making from sweet cider a table sirup, and a concentrated cider which ferments very slowly at refrigerator temperatures and can be easily transported and diluted as desired. Work was also continued to promote the wider use of corn meal, Kafir corn, honey, and various animal and vegetable fats, and in studies of candy-making, the manufacture of jams, jellies, etc., and the development of improved methods of handling fish, shell-fish, poultry, and eggs.

The high nutritive value of cottonseed meal as human food was again demonstrated by the Texas Experiment Station. Its limited employment in cakes and bread, using in the usual recipes one part to four of corn meal or wheat flour was suggested as a meat substitute. Elsewhere the value of the grain sorghums was shown.

Commercial condensed soups, even though labeled "beef" and "chicken," too frequently consisted chiefly of water, barley, rice, or other vegetable material. Powdered and cube sugars were generally free from adulteration, but sold at a price far above their increased cost of manufacture.

Studies of coffee making favored the filtration method, care being taken to use the freshly powdered berry and water at the full boiling temperature. Treating the coffee bean with finely powdered clay to remove oils was suggested as improving the quality and decreasing digestive disturbances. Straining was preferred for clarifying to adding eggs. Coffee drinking after meals was found to be justified in many cases by reason of its stimulating effect upon the vital processes.

The United States Referee Board reported that alum baking powders were not found to be injurious to health in small quantities. They were not believed to be more harmful than other baking powders, but inasmuch as all introduce into the alimentary tract a saline cathartic, moderation in the use of foods leavened with baking powder is suggested.

Mainly for sanitary reasons, the establishment of municipal abattoirs was advocated by the Kentucky Experiment Station. Large numbers of bacteria were found in commercial Hamburger steak, and the North Dakota Station showed the need of great care in sterilizing bottles used for carbonated beverages. On the other hand, flours properly stored were found to deteriorate very slightly on storage for several months, and strictly fresh fish, promptly frozen and properly handled, kept for two years without important chemical changes or depreciation in nutritive value. The wrapping of bread upon cooling to room temperature was found to keep down its bacterial content, as well as to preserve its freshness for days.

Studies of the various proteins by Osborne et al., again showed wide differences as to their utilization by the body for growth, and indi-

cated that their value for this purpose depends quite largely on their content of lysin; such substances as lactalbumin, casein, and egg vitellin being relatively well supplied, while there is none in the zein of maize. Others attributed the superiority of breast feeding to the absence of foreign proteins, but it was also found that when milk of another species was used the raw milk gave no better and sometimes inferior gains than pasteurized milk. Considerable differences were also found in the nutritive value of different fats, and Osborne et al., suggested that the high nutritive potency long popularly ascribed to butter, egg-yolk, and cod-liver oil may have a basis in their distinctive fatty acids.

The vexed questions of whole vs. white flour, and polished vs. unpolished rice were again under discussion. Loew suggested the use of calcium chloride in bread making to make up any deficiency of lime. Hill claimed that the milling processes are injurious by removing "vitamins," to the lack of which Funk ascribed such diseases as pellagra and beri-beri. There was also evidence, however, that the cause of these diseases was by no means fully understood, and it was generally admitted that the deficiency of either vitamins or ash will seldom be serious if the ordinary mixed diet is followed.

Additional dietary studies with Japanese monks indicated that their absolute vegetarian diet, supplying an average of 69 gms. of protein and 2592 calories of energy per day, sufficed to maintain health, but it is pointed out that the whole body and especially the digestive apparatus was accustomed to such a diet. On the other hand, Eskimos sometimes consumed as high as 4 pounds of seal meat, supplying 510 gms. of protein and 218 gms. of fat per day, and were likewise in good health. That muscular activity exercises a great influence on body requirements was shown in tests where the energy expenditures for work ranged from 4 calories per hour with a woman sewing by hand to 406 calories with a wood sawyer. An increase of carbon dioxide was also found in a subject memorizing meaningless syllables, which was attributed partly to the incidental muscular movements but mainly to psycho-physiological processes.

Bibliography. Some of the more important books of 1914 were as follows: E. H. S. Bailey, *The Source, Chemistry, and Use of Food Products* (Philadelphia); H. W. Wiley, *1001 Tests of Foods, Beverages, and Toilet Accessories* (New York); Janet McK. Hill, *The American Cook Book* (Boston); Mildred Maddocks, *The Pure Food Cook Book* (New York); Marion H. Neil, *Canning, Preserving, and Pickling* (Philadelphia); G. Lusk, *The Fundamental Basis of Nutrition* (New Haven and London); Lichtenfeld, *Die Geschichte der Ernährung* (Berlin); and M. Rubner, *Wandlungen in der Volksernährung* (Leipzig). See also AGRICULTURE; CARNEGIE INSTITUTION.

FOOT-AND-MOUTH DISEASE. See STOCK RAISING, and VETERINARY MEDICINE.

FOOTBALL. Harvard for the third year in succession won the Eastern intercollegiate football championship. As in 1913, the Crimson also went through the season without defeat. The wonderful showing of Harvard was made despite the absence of Charles E. Brickley, the captain and star drop kicker who scored all the points in the important games of 1913. Brickley underwent an operation for appendicitis just

before the season opened, and did not get into the game until the last few moments of the contest with Yale. Eddie Mahan and "Tack" Hardwick, however, stepped into the breach, and by their brilliant playing offset Brickley's loss.

Washington and Jefferson, and Brown, put up the best battles against Harvard, the former being beaten by only one point, and the latter gaining a scoreless tie. Penn State, too, tied the Cambridge eleven. The Crimson, however, did not have its full strength in the field in these games. The contests with Princeton and Yale resulted in easy victories. That between the Crimson and the Blue, held in the new Yale Bowl, was witnessed by 70,000 persons, the largest gathering of its kind ever assembled. The score, 36 to 0, established another new record, for never before in the history of football relations between the two institutions had so crushing a defeat been administered.

The ranking of other Eastern teams presents its usual difficulties. Some experts placed Dartmouth second, while others gave this honor to Washington and Jefferson, which defeated Yale and lost only to Harvard. The Yale team was a disappointment to its followers, although it was generally conceded that the new coaching system put into vogue by Frank Hinkey was bound to produce satisfactory results in time. Yale resorted to the open game more frequently than the other big teams, and during the early part of the season made an excellent showing. In the crucial test—the game with Harvard—the open attack failed lamentably, the Crimson players having no difficulty in breaking through the Blue line, and smearing it before it was really under way.

Princeton, with perhaps the best material to work with possessed by any college, turned out a most unsatisfactory eleven and it is expected that another year will see a different coaching system at work. The Tigers showed their real strength in the last period of the game with Yale, when by a series of brilliant rushes down the field they almost snatched victory from defeat. Cornell after a poor start came to life in the latter part of the season, and triumphed over Brown, Michigan, and Pennsylvania. The only blot on Dartmouth's record was the defeat suffered at the hands of Princeton. Rutgers under the tutelage of Foster Sanford, the old Yale forward, turned out the strongest team in its history.

West Point played through its schedule without defeat, but in the main met weak opposition. Other teams deserving honorable mention are the University of Pittsburgh, Lehigh, Syracuse, Penn State, Williams, Trinity, and Union. Of the Western college teams, Illinois made the best showing. A summary of the games played by the leading colleges follows:

Harvard 44, Bates 0; Harvard 10, Washington and Jefferson 9; Harvard 13, Tufts 6; Harvard 13, Penn State 13; Harvard 7, Michigan 0; Harvard 20, Princeton 0; Harvard 0, Brown 0; Harvard 36, Yale 0.

Dartmouth 21, Williams 3; Dartmouth 42, Vermont 0; Dartmouth 12, Princeton 16; Dartmouth 66, Tufts 0; Dartmouth 41, Pennsylvania 0; Dartmouth 40, Syracuse 0.

Washington and Jefferson 105, Dickinson 0; Washington and Jefferson 9, Harvard 10; Washington and Jefferson 13, Yale 7; Washington and Jefferson 13, Pittsburgh 10; Washington

and Jefferson 14, Georgetown 6; Washington and Jefferson 34, Bucknell 0; Washington and Jefferson 20, Rutgers 13.

Cornell 28, Ursinus 0; Cornell 3, Pittsburgh 9; Cornell 3, Colgate 7; Cornell 21, Carlisle Indians 0; Cornell 48, Bucknell 0; Cornell 28, Brown 7; Cornell 48, Holy Cross 3; Cornell 26, Franklin and Marshall 3; Cornell 26, Michigan 13; Cornell 24, Pennsylvania 12.

Yale 20, Maine 0; Yale 21, Virginia 0; Yale 20, Lehigh 3; Yale 7, Washington and Jefferson 13; Yale 49, Colgate 7; Yale 14, Brown 6; Yale 19, Princeton 14; Yale 0, Harvard 36.

Princeton 12, Rutgers 0; Princeton 10, Bucknell 0; Princeton 12, Syracuse 7; Princeton 16, Lafayette 0; Princeton 16, Dartmouth 12; Princeton 7, Williams 7; Princeton 0, Harvard 20; Princeton 14, Yale 19.

Brown 24, Norwich 0; Brown 20, Rhode Island State 0; Brown 0, Amherst 0; Brown 16, Wesleyan 0; Brown 7, Cornell 28; Brown 12, Vermont 9; Brown 6, Yale 14; Brown 0, Harvard 0; Brown 20, Carlisle Indians 14.

The "All-American" eleven as picked by Walter Camp was made up as follows: Ends, Hardwick of Harvard, and O'Hearn of Cornell; tackles, Ballin of Princeton, and Trumbull of Harvard; guards, Pennock of Harvard, and Chapman of Illinois; centre, McEwan of West Point; quarter back, Ghee of Dartmouth; half backs, Maultbetsch of Michigan, and Bradlee of Harvard; full back, Mahan of Harvard.

There were twelve deaths attributed to football in 1914, while 179 players were reported as injured. According to Parke H. Davis, football was played by 450 colleges, 6000 secondary schools, and 1500 teams not connected with educational institutions. Thirty-four thousand games were contested, 152,000 players taking part. The estimated number of persons attending these games is 6,292,000.

Association football, or soccer, greatly increased in popularity in the United States during the year 1914. This was chiefly due to the efficient work of the recently organized United States of America Football Association, which placed the sport on the highest plane it had ever attained. In England the game was generally played, despite the fact that the players, both professional and amateur, were severely criticised on the ground that the army needed their services.

The Brooklyn Field Club won the first series, or cup tie contest, for the U. S. National Trophy in defeating the Brooklyn Celtics by a score of 1 to 0. The same eleven also captured the championship of the National Football League. The Bethlehem Football Club of Bethlehem, Pa., carried off the American Football Association cup by defeating Tacony at Newark. The score was 1 to 0. The Brooklyn Celtics finished first in the New York State Football League. The intercollegiate championship was competed for twice, Harvard winning in the spring, and Pennsylvania in the fall.

FORESTRY. The year 1914 was marked by a striking demonstration of the value of various accepted systems for protecting forests from fire. Light snows in the great forest regions of the

United States and Canada warned government organizations and private timber protective associations to prepare early for a bad fire season. Marked improvements were made in means of communicating with fire-fighting headquarters, more telephone lines to mountain lookouts were built, more roads and trails for quick access to danger points were opened, and more money was spent than in any previous year. In Western Canada wireless telegraphy was used to report fires, and many Indians were enlisted as fire rangers. In the West the automobile proved an economical and efficient means of transporting fire fighters. A greater number of fires occurred than for many years past, but the rapidity with which fires were reported and controlled resulted in a relatively small loss of valuable timber. Most of the large fires were confined to areas where they did but little damage. With the recent addition of Michigan, eighteen States are now coöperating with the Federal Government in protecting the watersheds of navigable streams from fire. One hundred thousand dollars were allotted to this work in the Agricultural Appropriation Act of 1914-15. The co-operating States appropriated \$450,000 for the same period. The chief lesson learned from the year's fire work is the need of arranging for emergency funds to meet unusually severe fire conditions.

At the annual meeting of the American Forestry Association, Washington, D. C., Jan. 14, 1914, Dr. Henry S. Drinker of Lehigh University was reelected president. A platform of principles and policies was unanimously adopted. The association essentially declared itself to be a voluntary and independent organization, with no official connection with any Federal or State department or policy, and devoted to the inculcation and spread of a forest policy on a scale adequate for the economic needs of the country. While recognizing the need of Federal and State forestry with adequate appropriations for the same, the association, at the same time, has agreed to actively support a number of policies looking to development of private forestry. Among these policies may be mentioned the acquirement of waste lands by long-lived corporations for forest planting, and also planting by private owners, where profitable, and encouragement of natural regeneration; forest taxation reforms removing unjust burdens from owners of growing timber; closer utilization in logging and manufacturing without loss to owner and aid to lumbermen in achieving this; cutting of mature timber where and as the domestic market demands it, except on areas maintained for park and scenic purposes, and compensation of forest owners for loss suffered through protection of watersheds or on behalf of any public interest; equal protection to the lumber industry and to public interests in legislation affecting private timber land operations; and classification by experts of lands best suited for farming and those best suited for forestry, and liberal National and State appropriations for this work.

NATIONAL FOREST SERVICE. Systematic land classification, with special reference to the elimination of lands suitable for agriculture, is now under way on 100 of the 163 National Forests. In consequence of this work, which was begun in 1909, over 10,000,000 acres have been eliminated from the forests. Of this amount, 1,684,069 acres had been opened to settlement, under

the Forest Homestead Law, on June 30, 1914. A number of prior claims to forest lands were adjusted and some exchanges of public land for private land of equal value were made in order to consolidate both government and private holdings. The result of all these activities was to leave within the National Forest boundaries on June 30, 1914, 185,321,202 acres, of which 21,472,672 acres are private land.

On recommendation of the Forest Service, the National Forest Reservation Commission approved for purchase under the Weeks Law (see *FORESTRY*, 1912) tracts aggregating 391,114 acres, making a total approved area of 1,104,529 acres in the Southern Appalachian and the White Mountains. The most important acquisition was the Pisgah Forest of 86,700 acres in North Carolina. This forest had already been developed into one of the finest forest properties in the country by the late George W. Vanderbilt. The purchase was made possible by the generosity of Mrs. Vanderbilt, who accepted the price of \$5 an acre because she wished to perpetuate her husband's pioneer work in forest conservation and to insure the use and enjoyment of the forest for the American people for all time. In addition to its use for watershed protection, it is proposed to make Pisgah Forest a game refuge for the preservation of the fauna of the eastern mountains. The tract is already well-stocked with game and fish.

The cost of administration, protection, and permanent improvements on the National Forests for 1914 was approximately \$5,370,000. The receipts were: Timber sold, \$1,304,053.56; grazing, \$1,002,347.59; special uses, \$131,309.06; total, \$2,437,710.21. Of these receipts, 25 per cent is payable to the States in which the forests are situated for county schools and roads. An additional 10 per cent must be used by the Secretary of Agriculture in building roads and trails on the National Forests for the benefit of the public. The estimated value of all improvements on the National Forests at the close of the year was \$4,553,453. Of this amount, \$3,116,937, or 69 per cent, represents works of communication and protection.

Experiments on the best methods of reforestation have shown almost uniformly that planting nursery-grown trees is a cheaper method than direct sowing of tree seed. The Forest Service has completed adequate nursery equipment to conduct planting operations on a large scale. Fourteen thousand acres were planted during the year, while but 6400 acres were seeded. In the future it is planned to restock approximately 14,000 acres annually by planting, and to reduce direct seeding to about 2500 acres. Studies in progress at the forest experiment stations included 144 of reforestation, 38 of forest management, 4 of forest influences, 15 of forest mensuration, and 14 of forest protection. Among the results secured in these investigations, it has been found that western white pine seed retains its vitality in the chaff and litter beneath mature stands from one to four years, and germinates when the ground is exposed to direct light by cutting. Observations of the effects of forest cover on stream flow and erosion have shown that Rocky Mountain watersheds, at elevations between 9000 and 11,000 feet, discharge through streams only about 29 per cent of the water which falls upon them in the form of rain and snow. A new and much shorter method of find-

ing the cubic contents of trees was tested on nine native species with very satisfactory results, and tables were prepared which will save a large part of the time hitherto required to measure the volume of felled trees. The study of basket willow culture was substantially completed. This work has demonstrated the value of willow culture as a means of utilizing overflow lands not suited for other crops. Over 1,750,000 willow cuttings have thus far been distributed to State experiment stations, forest schools, and individuals. The work of distribution will be continued.

LEGISLATION. Massachusetts enacted the following forest measures during the year: A revision of the Public Domain Act, giving towns and cities the right to own and manage municipal forests; provision for a forest commission with the power to spend \$10,000 the first year, and \$20,000 annually thereafter in the purchase and reforestation of land at a price not to exceed \$5 an acre, the land to be exempt from taxation, but cities and towns to be reimbursed by the Commonwealth for losses in taxes thereby; and laws for the disposal of slash and brushwood within the limits of highways and public roads as well as within the neighborhood of woodlands, railroads, and highways. Maryland passed a law for protecting roadside trees to be administered by the State Board of Forestry, and also provided for planting roadside trees with otherwise unexpended funds of the board, and the prevention of promiscuous placing of advertising signs and billboards along public roads. Virginia created the office of State Forester in the State Geological Commission. Provision was made for establishing forest reserves, forest protection, investigation, and assistance to private owners. North Dakota designated the State School of Forestry as a State nursery, with the president of the school as State forester. Pennsylvania passed measures to strengthen the fire protective service of the State. Minnesota provided by constitutional amendment for the establishment of State forests on State lands which are unfitted for agriculture. An active campaign was under way to secure forest legislation during the coming year in a number of States which have hitherto been indifferent to forestry.

TIMBER SURVEY. The Secretary of Commerce and the Secretary of Agriculture have completed plans whereby their two departments will combine in a constructive study of the supply and exploitation of timber in the United States, which has now become one of the big conservation and industrial problems. The study is to be undertaken in the belief that the methods used in exploiting timber resources and the restoration of normal and healthy conditions in the industries which convert timber into usable products, vitally concern the public at large. Extensive surveys already made show that the total amount of standing timber in the United States is close to 2900 billion board feet, of which 2200 billion feet is privately owned, 600 billion feet is in the National Forests, and about 90 billion feet is in some other form of public ownership. The annual cut of saw timber alone is approximately 43 billion feet. Special attention will be given to means of utilizing low grades of lumber and by-products.

FOREIGN COUNTRIES. Forest activities in Europe have been seriously disturbed by the great

war. The forest organizations of the continental warring nations are composed for the most part of able-bodied military or semimilitary trained men. It was conservatively estimated that over 40,000 foresters were engaged in the conflict on various battlefields. All forestry gatherings such as the Seventh Congress of the International Union of Experimental Forest Institutes, which was to have been held at Budapest in September, were necessarily postponed. This also applies to the National Forestry Congress which was to have been held at Ottawa in January, 1915. French forests in the war zone were being freely used in defensive operations, since they aided in concealing the positions and numbers of the various armies from the vigilance of the enemy's aviators. Serious damage will accrue to these forests from modern artillery fire and other causes. Great Britain's timber supply from the Baltic provinces was cut off by Germany and the English government was taking steps toward securing timber in Canada.

During the past year the Prussian State forests, with a productive area of 6,700,000 acres, yielded a net income of \$20,500,000, or about \$3 per acre, the expenditures being about 44 per cent of the gross income. Austrian experiments with wood preservatives have shown that zinc fluorid and sodium fluorid compounds are strongly antiseptic against wood-destroying fungi and much superior to copper sulphate and zinc chlorid. Switzerland passed a law prohibiting clear cutting in protection forests, except under the most unusual circumstances. France purchased the Forest of Eu from the Duke of Orleans. The total of 2,301,258 acres, which is situated in the Districts of Dieppe and Neufchâtel, was purchased for \$2,100,000. Experiments in sand binding work in Holland have shown that a mulch of lupine straw has considerable value in promoting both the root and top development of fir trees on drifting sand areas. Similar results with lupine straw, pine litter, etc., have been secured with pine trees on alluvial sand at Eberswalde, Germany. The Royal Botanical Garden and Museum at Berlin has issued a separate publication containing descriptive accounts of a large number of wild forest plants utilized by the Bulus in South Kamerun, Africa.

In Southern Nigeria, on the west coast of Africa, 800 villages now have communal plantations of rubber trees. The natives supply the labor, the native chiefs the land, and the Forestry Department the seeds, technical knowledge, and tapping appliances, the profits being divided equally among the three coöperative parties. A representative of the Japanese government recently toured the National Forests of the United States to learn the government's methods of selling timber and reforestation. One of the principal by-products of the national forests of Japan is furnished by mushrooms, which have yielded in one year a revenue of a million dollars. The Korean government has established nurseries with the idea of educating the people to the importance of tree planting. Several large firms have started reforestation. Planting plans for over 50,000 acres are now under way. In connection with the proposed establishment of forest reserves, the Brazilian government recently completed a survey map of the forest areas of that country. A forest service is being organized by the Argentine government.

FOREST SCHOOLS, PERSONNEL, ETC. The Biltmore Forest School, established in 1898, and therefore the oldest forest school in America, has been discontinued. Dr. C. A. Schenk, its director, returned to his home in Germany, from whence it was later reported that he fell in battle in France. Oberforstmeister Fricke, director of the Forest Academy of Munich, was also killed. The death of Dr. John Nisbet, forestry adviser to the Scottish Board of Agriculture, was announced late in the year.

The forestry building at Cornell University was opened on May 15. Ralph S. Hosmer resigned as superintendent of forestry in the Hawaiian Islands to take the position of professor of forestry at Cornell in place of Walter Mulford, who assumes the new professorship of forestry at the University of California. Major George P. Ahern resigned as director of the Philippine Forestry Bureau, after fifteen years of service.

Prof. James B. Berry, formerly of Pennsylvania State College, is in charge of the newly established Forest School of the Georgia State College of Agriculture. A new forestry department was opened at the University of Montana, with Dr. Dorr Skeels as dean.

The King of England has given permission to have part of the royal estate placed at the disposal of the school of forestry at Cambridge University for the purposes of experiment and demonstration.

FORESTRY ASSOCIATION OF AMERICA. See FORESTRY.

FORMOSA, or TAIWAN. An island dependency of Japan, off the coast of the Chinese province of Fukien. Capital, Dai-Hoku, or Taipei. The area of the island of Formosa is 2318.5 square ri; the seven adjacent isles, 5.6 square ri; total, 2324.1 square ri, or 13,841 square miles. Estimates of the population vary; one for 1913 places the legal population at 3,512,607. The present population as officially estimated for the end of 1911 was 3,410,838, of whom 1,794,052 males and 1,616,786 females; civilized aboriginals numbered 1,652,687 males and 1,510,100 females; uncivilized aboriginals, 61,680 and 60,279; Japanese, 65,158 and 44,628; foreigners, 14,527 and 1779. Estimated population of the larger towns Dec. 31, 1911: Dai-Hoku (consisting of Jonai, Moko, and Dai-tote), 95,077; Dainan (or Tainan), 59,601; Kagi (or Chia-i), 22,418; Rokko (or Lukong),

19,153; Kiilung (or Keelung), 17,962; Shin-ehiku (or Hsinchu), 16,294; Gilan (or Ilan), 16,062; Shokwa (or Changhua), 15,545; Taku (or Takow), 13,775; Daichiu (or Taichu), 12,788; Toko (or Tonkong), 12,230.

Formosa was ceded by China to Japan in 1895, and Japanese civil government was instituted in the following year; since then many improvements have been made, including the establishment of an educational system. The 1905 census showed that 97.62 per cent of the population were illiterate. According to a recent report, there were 169 elementary schools, with 892 teachers and 39,012 pupils.

The agricultural products include rice, tea, sugar, sweet potatoes, jute, and ramie. The forests yield large quantities of camphor, worked as a government monopoly. Mining in Formosa shows development; the mineral products include gold, silver, copper, sulphur, coal, and petroleum. The fisheries are of considerable importance. Manufactures include flour, sugar, spirits, tobacco, oil, soap, etc. Exclusive of the large trade with Japan, imports and exports of merchandise have been as follows, in thousands of yen:

	1908	1907	1910	1911	1912
Imports . . .	10,101	11,221	19,858	19,555	19,807
Exports . . .	13,724	9,741	11,987	13,176	14,960

Leading imports in 1911 and 1912 respectively (exclusive of imports from Japan): opium, 1880 and 3094; oil cake, 909 and 1917; rice, 416 and 1150; sugar machinery, 4238 and 1044; leaf tobacco, 829 and 891; kerosene, 660 and 750; paper and manufactures, 599 and 613. There is a large importation of cotton and silk fabrics. Principal exports in 1911 and 1912 respectively, in thousands of yen (exclusive of exports to Japan): refined camphor, 3463 and 4410; Oolong tea, 5228 and 4058; Pouchong tea, 1811 and 2564; sugar, 956 and 1719; flax and hemp, 389 and 379. Imports from and exports to China in 1912, 6767 and 4264 thousand yen; United Kingdom, 3490 and 1087; British India, 2173 and 342; United States, 1700 and 4917; Germany, 1072 and 1573. State railways in 1912, 296 miles; private railways (including light railways on sugar estates), 671 miles.

The budget for 1913-14 balanced at 44,055,366 yen. Formosa is administered by a governor-general, resident at Dai-Hoku (in 1914, Lieut. Gen. Count Sakuma Samata).

FORWARD-TO-THE-LAND LEAGUE. See AGRICULTURE.

FOURTH OF JULY ACCIDENTS. See TETANUS.

FOWLER, EDWARD PAYSON. An American physician and writer on medical subjects, died Jan. 29, 1914. He was born in 1834 at Cohocton, N. Y., and in 1855 graduated from the New York Medical College. He became one of the most prominent physicians in the State and served as visiting physician to many hospitals. He was the author of: *Etiology and General History of Scarlet Fever*; *Certain Maladies of the Heart*; and *Abnormalities of the Cerebral Convulsions*. He was also a member of several medical societies.

FRANCE. A republic in western Europe. Capital, Paris.

AREA AND POPULATION. In the following table are embodied the returns by departments

of the census of March 5, 1911; the area is given in square kilometers. The legal population is compared with that for 1906 and the density per square kilometer is given for 1911. The total area is equivalent to 53,846,374 hectares, or to 207,129 square miles. The area as calculated in 1901 excludes the foreshore, the estuaries, and certain barren regions, and is reckoned at 52,945,198 hectares, with a population of 38,961,945.

The number of marriages in 1912 was 311,929, against 307,788 in 1911; divorces, 14,579, against 13,058; living births, 750,651, against 742,114; stillbirths, 34,312, against 33,840; deaths, 692,740, against 776,983.

Some of the principal cities, with their communal population in 1911, are as follows: Paris, 2,888,110 (1,053,262 in 1851); Marseilles, 550,619; Lyons, 523,796; Bordeaux, 261,678; Lille, 217,807; Nantes, 170,535; Toulouse, 149,576; Saint-Etienne, 148,656; Nice, 142,940; Le Havre, 136,159; Rouen, 124,987; Roubaix, 122,723; Nancy, 119,949; Reims, 115,178; Toulon, 104,582; Amiens, 93,207; Limoges, 92,181; Brest, 90,540; Angers, 83,786; Tourcoing, 82,644; Nîmes, 80,437; Montpellier, 80,230; Rennes, 79,372; Grenoble, 77,438; Dijon, 76,874; Tours, 73,398; Calais, 73,322; Orléans, 72,096; Saint-Denis, 71,759; Le Mans, 69,361; Levallois-Perret, 68,703; Clermont-Ferrand, 65,386; Versailles, 60,458; Besançon, 57,978; Boulogne-sur-Seine, 57,027; Saint-Quentin, 55,571; Troyes, 55,486; Boulogne, 52,128; Béziers, 51,042; Avignon, 49,304; Lorient, 49,039; Caen, 46,934; Clichy, 46,676; Bourges, 45,735; Neuilly-sur-Seine, 44,616; Cherbourg, 43,731; Montreuil, 43,217; Asnières, 42,583; Villeurbanne, 42,525; Saint-Ouen, 41,904; Poitiers, 41,242; Perpignan, 39,510; Belfort, 39,371; Dunkerque, 38,891; Vincennes, 38,568; Ivry, 38,307; Saint-Nazaire, 38,267; Angoulême, 38,211; Courbevoie, 38,138; Aubervilliers, 37,558; Pau, 37,149.

EDUCATION. Education, public and private, is under the control of the ministry of public instruction, and is highly developed. Primary instruction is free and compulsory. By the law of 1904 all clerical schools were to be suppressed by 1914. There were still in 1911 under clerical teachers 17,175 infant-school and 75,292 primary-school pupils.

The conscription list, class of 1910, carried 301,467 men. Degree of instruction of 18,093 of these, unknown. Of the other 283,374, 2.79 per cent could neither read nor write, 1.31 per

1034

cent could read only, 27.44 per cent could read and write; 65.98 per cent had acquired a more extensive primary education, and 2.30 per cent were graduates of secondary institutions. The class of 1911 carried 314,369 conscripts, of whom 2.87 per cent could neither read nor write, 1.39 per cent could read only, 28.45 per cent could read and write; 62.38 per cent had acquired a more extensive primary education, and 2.30 per cent were graduates of secondary institutions; degree of instruction unknown in the case of 23,304.

Infant schools (1911-12) numbered 3873 (2639 public); instructors, 8362 (6706); pupils, 695,479 (254,311 boys and 240,394 girls in public schools). Primary schools, 81,237 (68,007 public); instructors, 154,700 (56,076 male and 61,962 female instructors in public schools); pupils, 5,526,404 (2,396,764 boys and 2,081,710 girls in public schools). Total state expenditure for primary instruction for the year 1911, 222,259,915 francs. There were in November, 1912, 62,092 boys in the lycées, and 36,796 in the communal colleges; and 19,898 girls in lycées, and 11,882 in communal colleges. Students in universities, Jan. 15, 1913, 41,109 (4066 women). Degrees are conferred by state universities alone.

Since the separation of church and state by the law of Dec. 9, 1905, the state, the departments, and the communes have been relieved of all financial obligations toward the churches, though pensions and allowances have been granted to avoid working hardship during the transition period. The arrangements made by the government to acquire administrative control over buildings used for public worship were not agreed to by the clergy, nor did the clergy acquiesce in the law of Dec. 9, 1905. All creeds are permitted public worship.

AGRICULTURE. The distribution of agricultural and other lands was calculated in 1911, as follows: 23,752,240 hectares under great crops and sown meadows, 4,905,670 under natural meadows, 1,526,560 under forage grasses, 3,664,380 under pastures, 1,664,880 under vines productive and nonproductive, 3,885,220 uncultivated land, 1,083,990 in rosaries, shrubberies, market gardens, etc.; 9,339,319 under wood and forest, and 2,861,069 hectares put to various uses not included in any of the foregoing.

In the table below are shown comparative values for two years of some main crops, in francs; with the production in quintals in 1912:

	Qs. 1912	Fr. 1912	Fr. 1911
Wheat ...	90,991,500	2,253,289,000	2,252,003,900
Meal ...	1,554,620	87,100,600	80,844,450
Rye	12,882,200	280,009,900	229,419,800
Barley ...	11,014,200	216,498,800	212,447,650
Buckwheat	5,006,940	112,858,700	44,924,400
Oats	51,541,600	1,091,969,900	1,042,468,400
Corn	6,028,680	141,748,900	89,022,050
Millet	154,555
Potatoes ...	150,251,580	1,089,165,180	1,180,647,420
Sugar beets	72,221,045	217,453,260	185,998,980
Other beets	28,165,860	54,715,570	88,196,280
Tobacco ..	226,272	24,817,500	19,476,070
Cider
Fruits	23,948,260	156,599,620	198,269,540
Vines	59,384,171	1,785,424,931	1,338,141,144

Including roots and grasses, annual and perennial, the area under all forage plants in 1911 was 15,271,830 hectares, yielding 709,963,000 quintals, valued at 3,517,472,000 francs; under

truck gardens, 291,420 hectares, yielding produce valued at 567,222,000 francs. Hay from natural meadows was valued at 1,268,423,640 francs; lucerne, 400,353,390; clover, 305,466,200; annuals planted for forage, 256,839,370; mixed grasses, 341,863,350.

In the table below are shown areas planted to main crops in 1913 and 1914, with production in quintals for 1913, as compared with 1912. Statistics for 1914 production are not available, on account of the European War.

	Hectares		Quintals	
	1913	1914	1913	1912
Wheat ...	6,542,280	6,498,880	86,919,050	91,182,600
Rye	1,175,710	1,178,610	12,714,750	13,089,000
Barley ...	760,205	782,000	10,487,600	11,881,840
Oats	3,979,270	3,979,420	51,826,010	54,519,700
Corn	410,700	461,920
Vines* ...	1,673,409	1,660,447	41,058,882	59,889,085
Tobacco ..	4,416	8,848	160,220
Beet* ...	281,440	242,887	9,191,806	7,519,508
Flax	28,015	24,702	78,260
Potatoes ..	1,489,470	1,555,780	1,517,020

* Production in hectoliters. † Sugar beets.

LIVE STOCK. In the table below are shown live stock statistics for comparative years ending December 31:

	1911	1912	1913
Horses	3,286,110	3,222,140	3,280,700
Mules	194,040	196,410	192,570
Asses	360,590	358,660	360,390
Cattle	14,552,430	14,705,900	14,807,880
Sheep	16,425,830	16,467,700	16,218,080
Swine	6,719,570	6,908,750	7,047,750
Goats	1,424,180	1,408,520	1,458,280

Of the horses enumerated Dec. 31, 1913, 2,558,170 were over and 672,530 were under three years; of the cattle, 7,807,560 were cows, 1,845,020 oxen, 284,490 bulls, 2,855,780 young stock, and 2,013,930 calves. Of the sheep, 9,334,840 were ewes over one year, 2,589,000 sheep over one year, 295,410 rams, 3,993,780 lambs; pigs under six months numbered 3,294,010, fat stock over six months 2,808,230, sows 960,000, boars 38,550.

In 1912, 33,133 hectograms of silk-worm eggs were placed to be hatched; cocoons obtained, 6,233,942 kilograms; average yield of cocoons per hectogram of eggs, 188.1 kilogram.

FISHERIES. There were, in 1905, 95,804 persons engaged in the various fisheries, with 27,645 sailing boats of 186,030 tons, and 201 steamers of 13,874 tons. The total value of the products was 122,891,036 francs, of which the cod fisheries contributed 18,880,855 francs, the herring fisheries 13,829,036, and the sardine fisheries 10,054,367. In 1909 there were 159,899 fishermen; total value of output, 134,865,728 francs. In 1910 there were 128,869 fishermen, with 28,288 sail boats of 206,129 aggregate tons and 454 steamers of 38,000 tons; value of sail boats, 51,933,057 francs; of steamers, 23,945,330; value of the engines, 25,309,360. Total value of all fisheries products for the year 1910, 140,288,211 francs.

MINING AND METALS. In 1911 there were 1471 conceded mines, covering an area of 1,179,466 hectares, of which 548, covering an area of 591,975 hectares, were in operation. In these mines 231,924 persons were employed—164,607 underground, 67,317 at the surface. Total estimated number of work days, 65,813,289; total estimated wages, 339,137,234 francs. Total out-

put, 57,971,922 tons, valued at 717,593,105 francs at the pit's mouth. The quarries employed 128,582 work people; output, 52,683,238 tons, valued at 278,564,187 francs. In the table below are shown some of the principal mining products, with their value in francs, for comparative years:

	Tons		Francs	
	1910	1911	1910	1911
Coal	37,684,898	38,520,827	569,084,521	589,219,277
Lignite	715,049	708,764	7,222,471	7,229,789
Iron ore	14,605,542	16,689,426	67,511,179	77,462,085
Peat	48,415	58,521	584,589	785,674
Salt	1,051,427	1,889,308	15,820,618	18,826,599
Gold ore	126,398	143,514	7,080,568	7,588,080
Zinc ore	50,624	48,761	5,078,066	5,159,005
Iron pyrites	250,482	277,942	4,269,498	4,696,685
Argent. lead	14,586	14,098	2,878,508	2,612,959
Antimony	28,180	29,267	1,793,117	1,596,688
Asphalt	38,512	35,568	638,494	566,688
Manganese	7,925	6,036	214,128	169,564

There were in operation, in 1911, 202 metal works, employing 101,538 work people and consuming 3,694,298 tons of coal, 5,080,482 tons of coke, 6974 tons of charcoal. The smelting works numbered 46, with 18,672 workers; output, 4,470,100 tons, valued at 339,136,000 francs. Puddling works, 99, with 15,191 work people; output, 517,800 tons, valued at 95,398,000 francs. Steel works, 96, with 67,675 workers; output 2,702,000 tons, valued at 556,689,000 francs. Other works, 36, with 5868 workers; output 109,651 tons, valued at 99,759,000 francs.

OTHER INDUSTRIES. The silk works in operation in 1910 numbered 193, with an output of 629,023,462 kilograms of spun silk. Sugar works in operation in 1911-12, 220, treating 4,077,843,268 kilograms of beets, and producing 465,377,621 kilograms of refined sugar. There were in operation in 1912 17,107 distilleries, with a total production of 3,106,609 hectoliters pure alcohol, and 681,185 hectoliters denatured alcohol.

COMMERCE. The imports and exports in special trade for two comparative years are shown below in thousands of francs (A—foodstuffs, B—raw materials, C—manufactured articles).

	Imports		Exports	
	1912	1913	1912	1913
A.	1,803,400	1,916,500	849,800	838,200
B.	4,813,200	4,941,600	1,944,900	1,882,700
C.	1,614,200	1,650,300	3,917,900	4,159,500
Total	8,230,800	8,508,400	6,712,600	6,875,400

The figures for the 1913 special trade are subject to slight revision. The general commerce for 1912 shows imports valued at 10,293,600,000 francs, and exports valued at 8,823,900,000 francs.

The following table shows imports and exports (special trade) by great classes for comparative years, 1913 provisional (values in thousands of francs):

	1911
Cereals	715,100
Wines	301,500
Textiles	1,694,900
Yarns*	228,600

* Silk and cotton threads, etc.; and woolen yarns.

A glance at some articles of special commerce valued at over 100,000,000 francs will show their growth or diminution during six years (values in millions of francs):

Imports	1905	1906	1909	1910	1912	1913
Wool	446.1	583.1	684.4	658.9	684.6	698.8
Cotton	811.4	858.9	494.7	469.8	567.1	541.2
Coal, etc.	217.8	861.2	442.1	400.7	501.4	575.2

* Articles de Paris.

Some of the principal countries of origin and destination in the special trade are given in the table below, with values in thousands of francs:

	Imports		Exports	
	1912	1913	1912	1913
U. K.	1,049,800	1,134,100	1,364,800	1,446,600
Germany	999,200	1,074,800	821,700	869,500
U. S.	890,800	870,700	481,400	420,800
Belgium	540,800	570,200	1,148,800	1,119,200
Russia	432,200	461,900	62,200	85,400
Argent.	333,500	396,000	188,700	199,000
Spain	230,100	286,400	140,100	151,300
Italy	209,400	238,100	802,800	306,300
Brazil	198,000	196,000	88,800	85,600
Switzerland	150,800	138,400	406,500	394,800
Turkey	101,100	89,200	87,000	82,300
Aus.-Hun.	106,500	102,000	48,800	8,700
Brit. Ind.	355,900	33,700
China	217,800	14,600

COMMUNICATIONS. At the end of 1910 there were in operation 40,484 kilometers of main railway lines, 234 of industrial lines, and 8956 of local lines; making a total of 49,628 kilometers, besides 8687 kilometers of tramways. The main lines had a personnel of 339,032, and rolling stock including 12,840 locomotives and 379,181 cars. The local lines had (1909) a personnel of 12,864,933 locomotives, and 13,603 cars. Receipts from main lines (1910) 1,829,942,000 francs; expenditure, 1,098,802,000; net profit, 731,140,000; net kilometeric profits, 18,060. Length of main lines in operation in 1911 40,692 kilometers; in 1912, 40,927. Length of local lines in operation in 1911, 9327; in 1912, 10,261.

Previous to the war a second railway line

	Imports		Exports	
	1912	1913	1912	1913

Wines	321,000	275,600	187,700	228,800
Textiles	1,779,700	1,785,900	635,200	658,400
Yarns*	231,200	219,800	1,004,800	1,095,400

* Silk and cotton threads, etc.; and woolen yarns.

from Le Havre to Paris, supplementing the double track line on the Western Railway state system was proposed, at the insistence of the business interests of Havre. The Western Railway maintained a double line which carried the heavy freight as well as the passengers between the port and the capital. The cost of the new line was estimated at \$16,405,000, and the time of construction about 10 years.

A notable achievement in French railway operation was the transporting of the entire British force from the region of the river Aisne to the field of action in Northwest France and Western Belgium. This operation began on October 3 from Compiègne, and the troops were detrained at St. Omer, 97 miles due north of Compiègne, and there was a total railway journey of about 180 miles. This movement was completed in 16 days and involved 609 trains, comprising about 16,800 cars, or an average of 32 trains a day, one every three-quarters of an hour through the day and night. The cavalry and three army corps were moved, including horses, guns, kit, and transport, and the operations were conducted in close proximity to the enemy.

Among the railways destroyed by the French army in their retreat before the first German advance on Paris, were the railways from Charleville, in the Department of the Ardennes to Rheims, and from Hirson, in the Department of the Aisne, to Montmedy, in the Department of the Meuse, 25 miles north of Verdun. These lines were restored by the Germans towards the end of the year, and they were also at work on the railways at Givet, on the Belgian border, and had replaced the bridges over the Meuse near Lumes, Flize, and Donchery, to the southeast of Mézières, and had opened the blocked tunnels near Montmedy and Mohon. In 1910 there were maintained by the state 38,261 kilometers of highway; 172,269 kilometers of main roads, 75,957 of byways, 285,726 other, partly or wholly maintained without state aid.

There were in 1911, 161,436 kilometers of telegraph lines, and 611,726 of wires; state telegraph stations 17,619; railway and private stations, 3645. There were 48,049 kilometers of urban telephone lines, with 965,385 of wires; and 103,288 kilometers of interurban lines, with 522,251 of wires. Post offices, 14,379. Postal receipts for the year 1911, 369,624,415 francs; expenditure (posts and telegraphs), 323,653,502 francs. Telegraphic receipts (including wireless), 46,511,246 francs. Telephone receipts, 50,434,582 francs.

FINANCE. The monetary unit is the franc, par value 19.295 cents. In the table below are shown in francs actual revenue and expenditure for three years.

	1909	1910	1911
Revenue	4,140,912,961	4,273,890,789	4,689,045,845
Expend.	4,186,090,468	4,321,918,609

The above figures include ordinary and extraordinary revenue and expenditure.

In the table below will be found details of the budget for 1913:

Revenue	1913	1914
Direct taxes	562,815,768	607,485,849
Other direct	59,518,262	68,087,892
Indirect	2,648,755,285	2,940,050,400

Revenue	1913	1914
Monopolies	968,655,878	1,004,858,621
Sundries	499,187,800	753,085,222
Total	4,788,882,438	5,873,517,984
Expenditure	1913	1914
Public debt	1,286,423,922	1,318,824,321
Government *	20,116,488	19,859,488
Finance	358,948,853	379,889,516
Justice	58,551,727	61,522,659
Foreign affairs	20,668,037	20,948,157

Commerce, etc.	16,792,879	16,470,665
Labor, etc.	106,669,853	112,122,892
Posts and Tels.	344,318,845	357,786,594
Colonies	105,585,393	110,918,291
Agriculture	55,002,741	57,999,100
Public works	840,905,255	852,822,750
Total	4,788,608,584	5,873,829,449

* Executive and legislative.

The special-services budget balanced at 816,329,331 francs for 1913. The total general debt Jan. 1, 1913, stood at 31,449,083,037; floating debt, Oct. 1, 1913, 1,432,412,800; grand total, 32,881,495,837.

ARMY. In any discussion of the strength and organization of the French army in 1914 it must be borne in mind that no statistics or details were available at the end of the year as to its rapid expansion on mobilization or the part played in the opening months of the war of 1914. The fighting strength of the French army on the initial mobilization was estimated at 650,000 rifles, 60,000 sabres, and 3000 field guns. Mobilization was ordered on August 3, and was reported complete on August 15. It was believed that there were then assembled 21 corps and 10 cavalry divisions, exclusive of troops in Africa, which were also being put in condition for active service and to be transported to the scene of war in Europe. The administration of the army is by a general staff and several departments under the War Minister—in 1914 M. Eugene Etienne—assisted by the Conseil Supérieur de la Guerre, consisting of 12 general officers, among whom are the chief of the general staff, commander in chief in case of war, and the chief of the army staff.

The French army proper, in times of peace, is known as the Metropolitan Army and is stationed in France, Algeria, and Tunis, being distinguished from the Colonial Army, which is made up of both white and native troops, and is stationed in France and the French colonies, though both are administered by the War Minister. Service in the Metropolitan Army is universal and compulsory, and under the law of 1913 with a period of liability from the age of 20 to 48, as follows: with the colors, 3 years, joining at the age of 20; with the reserve, 11 years; with the territorial army, 7 years; with the territorial reserve, 7 years. This makes a total liability to service of 28 years, ending at the age of 48. Service in the Colonial Army is normally by voluntary enlistment. There are also colonial forces, mostly native. In times of peace, the reserve for the active army is called out twice for a period of four weeks, the territorial army once for two weeks; the territorial reserve has no regular training.

Before the war the total peace strength of

the Metropolitan Army was given as 639 battalions of infantry, 445 squadrons of cavalry, 694 batteries of artillery, these numbers including 30,000 natives stationed in Algeria and Tunis. With the 620,000 Europeans in France and 53,000 Europeans in Algeria and Tunis, a total of 703,000 for the Metropolitan Army was estimated. The horses maintained for this army numbered 150,634. Adding the total Colonial Army of 87,000, there was an aggregate of 790,000 for the total peace strength. These figures for 1914 do not include administrative corps, staffs and services, military schools, etc.

On the bases above discussed, the field army of France sent into active service might be roughly estimated at 800,000 combatants. The 36 reserve divisions and reserve cavalry would add 500,000 more. The Algerian Corps and Colonials in France, if all brought into service, would add about 80,000 men, giving a grand total of 1,380,000 combatants, available at the outbreak of war. How far the mobilization strength of 1,380,000 combatants above estimates could be increased, as war progressed, to possibly 3,000,000 all trained men, and how far it was realized or in process of realization, was of course merely a matter of conjecture, but military critics seemed to think that the French mobilization while slow was effective.

Each of the French Army Corps is recruited from a definite territorial district. At the outbreak of the war there were 20 army corps and 1 additional Colonial Army Corps in Algeria, making 21 in all. Each corps usually has 2 or 3 divisions, and each division 2 brigades. The general plan of organization gives 2 infantry regiments to a brigade, which contains from 6 to 8 battalions. To each infantry division is attached 1 field artillery regiment of 9 batteries (36 guns). The corps artillery consists of 9 field and 3 howitzer batteries, plus 6 skeleton batteries, which in time of war are filled out to give a total of 144 guns per corps. To the corps is also attached a cavalry brigade of 2 regiments and certain technical troops. The heavy batteries of 2 guns each are distributed as needed by army corps. There were at the outbreak of the war, 10 cavalry divisions, each made up of 3 brigades of 2 regiments each, to which 2 batteries of horse artillery are attached, making an aggregate for a cavalry division of 24 squadrons and 12 guns. Based on the above, the army corps, as organized on mobilization at the outbreak of the war, should have presented a combatant strength of about 33,000, the cavalry division about 4700.

The reserve of the active army and the territorial army, which early in the war was drawn on, was each organized into 36 divisions, and their functions in addition were to furnish garrisons for the home stations, the surplus men being called to the regimental depots to supply the losses in battle. There would also be available for garrison duty 38 battalions of the Customs Corps and a large number of *chasseurs forestiers*, both of which classes are recruited from the army. The *gendarmerie* (military police), amounting to more than 20,000 men, would be available for local distributions. The police force of Paris, and *Garde Républicaine*, about 3000 strong, would be used for similar duties, although there is available little to

show the extent to which use has been made of these sources.

A better understanding of the organization of the French army may be secured by considering the basic units on which that organization depends, though in 1914 it was inevitable that modifications due to mobilization and the exigencies of war should have occurred. The real basis of the French infantry organization is the battalion. Usually a battalion has 4 companies; sometimes 3, sometimes 5 or 6, or even more. The number of battalions in a regiment varies greatly. The maximum is 4 battalions to the regiment. As a rule, the infantry company has 3 officers and 140 men in peace; in war, about 250 men. The French battalion at war strength has, on the average, 19 officers and 1009 men. The basic unit of the cavalry is the squadron, composed of 5 officers and 150 men. At the beginning of 1914 the French cavalry, 79 regiments in all, serving in France, proper, were reorganized, and grouped into 10 cavalry divisions, of which 8 had 3 brigades each, and the remaining 2, the 4th and 10th, 4 brigades each. Fifteen of the brigades contained 3 regiments, while the other 17 brigades consisted of only 2 regiments each. The plans provided that at the time of war 1 regiment of cavalry, or in exceptional cases 2 or 3 regiments, were to be assigned to each army corps, these regiments being designated in special orders, but in time of peace they would remain attached to the cavalry divisions. The reorganization scheme further provided the assigning of a battalion of horse artillery and a bicycle corps to each division of the cavalry. This group was to be formed of a company or a half company of *chasseurs*. It is divided into three platoons and mounted on portable bicycles. It is intended to keep up with the cavalry no matter at what pace or over what rough ground the latter moves, and is to afford it instant infantry support at any desired moment.

In the French service, the battery of field artillery at peace strength varies from 3 officers and 110 men to 3 officers and 175 men, which is raised at war strength to 4 officers, possibly 5, and 175 men. The French mountain battery has about 140 men. Light batteries have 4 guns; mountain batteries, 6. All officers of artillery are on one list, and the foot artillery is divided into two branches, coast artillery, and fortress artillery. The total peace strength of foot artillery, including workmen, in 1913 was about 468 officers and 16,162 men. All technical troops are known as engineers, including the *Aéronautical Corps*. They aggregated in 1913 585 officers and about 18,000 men. The war strength of the major portion of the engineer companies is 4 officers and 252 enlisted men. The *Aéronautical Corps*, previous to the war, was organized in three groups. Each group has from 2 to 4 companies. Sections were detached with the mobile army. In 1914 there were 27 sections of 8 *aéroplanes* each, 10 cavalry sections of 3 *aéroplanes* each, and 11 fortress sections of 8 *aéroplanes* each, aggregating a total of 334 *aéroplanes*. There were also 14 dirigibles. Train troops are organized into "squadrons"; each squadron contains 3 companies. Total peace footing, 412 officers, and about 10,500 men. Sanitary troops included about 1500 officers, 6200 men; and the veterinarians numbered about 475 officers.

The French infantry use the Lebel magazine rifle; calibre, 0.315 inch. The cavalry has the carbine. The field gun is a rapid-fire shielded gun, 2.95 inch calibre, and was considered the best in Europe, and gave a good account of itself in the war. The howitzer batteries use calibres of 4 inches and 6.2 inches, and in many cases were outranged and outweighed by the Germans.

The permanent land defenses, previous to the war of 1914, were designed to protect a line of 1575 miles, and were an important strategic consideration. On the principal land frontier of Germany the fortified places were Verdun, Toul, Epinal, Belfort, behind which was a second line as follows: Maubeuge, La Fere, Rheims, Langres, Dijon, Besançon. Along the Italian front were Briançon, Grenoble, and Lyons. On the coast line the principal naval stations, guarded by the forts, were Toulon, Rochefort, Lorient, Brest, and Cherbourg.

The Budget for 1914 provided for military expenditures as follows:

For the Metropolitan Army	\$209,472,660
Colonial Troops in France	9,866,280
Troops in Morocco	46,779,860
Armament and supplies	21,180,000
Total *	\$287,298,800

* Expense of colonial troops abroad not included in this total.

NAVY. France ranks fourth among the nations (the United Kingdom, Germany, the United States) in the amount of warship tonnage built, and third in the aggregate of tonnage built and building. The number and displacement (built), July 1, 1914, of warships of 1500 or more tons, and of torpedo craft of more than 50 tons, were as follows: 4 battleships (dreadnought type), having a main battery of all big guns (11 inch or more in calibre), of 92,368 tons (and 8, of 193,656 tons estimated, building); 18 battleships (pre-dreadnought type, of about 10,000 or more tons displacement and a main battery of more than one calibre), of 262,675 tons; 1 coast-defense vessel, of 8800 tons; 20 armored cruisers, of 201,724 tons; 9 cruisers (unarmored warships of more than 1500 tons), of 46,095 tons; 84 torpedo-boat destroyers, of 35,812 tons (and 3, of 2563 tons, building); 135 torpedo boats, of 13,426; and 64 submarines, of 27,940 tons (and 22, of 14,766 tons, building). Total number of vessels built, 335, of 688,840 aggregate tons; building, 33, of 211,075 tons—a total of vessels built and building of 368, of 899,915 tons. Excluded from the foregoing are ships over 20 years old, unless reconstructed and rearmed within five years; torpedo craft over 15 years old, transports, colliers, repair ships, torpedo-depot ships, and other auxiliaries. The total strength of the personnel, including reserves, was about 180,000, one-third being active-service ratings. The general efficiency increased noticeably from 1904 to 1914. The main squadrons were concentrated in the Mediterranean under the command of Admiral Boué de Lapeyrière. The armored-cruiser fleet contained the *Edgar Quinet* and the *Waldeck Rousseau*, completed in 1911, and having a displacement of 13,000 tons, and an armament of 14 7.6-inch guns.

At the beginning of 1914 the fleet in the Mediterranean was made up as follows: first

squadron of battleships—*Courbet*, *Jean Bart*, *Condorcet*, *Danton*, *Diderot*, *Mirabeau*, *Verginaud*, and *Voltaire*; second squadron, made up of older battleships—*Patrie*, *Democratie*, *Justice*, *République*, and *Vérité*; reserve ships—*Bouvet*, *Gaulois*, and *St. Louis*; armored cruisers—*Waldeck Rousseau*, *Edgar Quinet*, *Ernest Renan*, *Jules Ferry*, *Léon Gambetta*, and *Victor Hugo*. The armored cruisers *Montcalm* and *Dupleix* were maintained in Eastern waters.

Dreadnoughts laid down in 1913 were the *Flandres*, *Gascogne*, *Languedoc*, *Normandie*, and *Béarn* (the latter 1914). These ships are to displace 25,800 tons and be armed with 12 13.4-inch and 24 5.5-inch guns. The three battleships launched in 1913 are the *Lorraine*, *Bretagne*, and *Provence*, having a displacement of 23,177 tons and armed with 10 13.4-inch and 22 5.5-inch guns. The *Jean Bart* and the *Courbet* were completed in 1913, having a displacement of 23,096 tons, and being armed with 12 12-inch and 22 5.5-inch guns. The *Paris* and the *France* were completed in 1914. The *Vendée* was to have been laid down early in 1915.

The submarine service is highly efficient, the vessels composing it being remarkable for their heavy armament. Air craft, April 7, 1913, included 13 military dirigibles on hand and 7 ordered; and 450 military aëroplanes on hand, including monoplanes, biplanes, and hydroaëroplanes.

GOVERNMENT. The republic, established after the overthrow of Napoleon III, Sept. 4, 1870, vests the executive in a president and a responsible ministry, and the legislative power in a senate and a chamber of deputies. The president, elected by an absolute majority of votes for seven years, chooses his own cabinet, ordinarily, but not of necessity, selected from among the members of the two chambers. The senate is made up of 300 members, age not less than 40 years, and elected by delegates for nine years. The chamber of deputies is made up of members elected by direct popular vote for four years, one to every 70,000 inhabitants. The president from 1906 to 1913 was Clément-Armand Fallières; he was succeeded Jan. 17, 1913, by Raymond Poincaré, born 1858. The ministry as composed March 18, 1914, included the following members: Gaston Doumergue, prime minister and minister for foreign affairs; M. Bienvenu-Martin, minister of justice; M. Malvy, interior; M. Naulens, war; M. Lebrun, marine; M. Viviani, public instruction; M. René Renoult, finance; M. Lebrun, colonies; M. Raynaud, agriculture; M. Peret, commerce and posts and telegraphs; M. Fernand David, public works; M. Métin, labor.

HISTORY.

THE ACHIEVEMENTS OF THE DOUMERGUE CABINET. The Doumergue Cabinet, formed Dec. 8, 1913, was essentially a cabinet of compromises. The dominant personality in the ministry was that of Caillaux, minister of finance and chief of the Unified Radical organization, the *Comité de la rue de Valois*; in the Chamber the main support of the ministry was from the Unified Radical group, influential out of all proportion to its size. It might have been expected that the Doumergue cabinet would carry out the Unified Radical policies as laid down by the Congress of Pau: (1) repeal of the three years' military service law, (2) *défense laïque* (i.e.

legislation against the religious schools), and (3) an income tax. On the first point, however, M. Doumergue's inaugural declaration flatly contradicted the Unified Radical programme by promising that the Three Year Law would be loyally applied; for, in order to obtain the support of M. Clémenceau in the Senate, M. Doumergue was compelled to compromise with M. Clémenceau's ardent militarism. On the income tax, M. Doumergue was likewise confronted with the necessity of straddling the chasm between his supporters in the Senate, who disliked the taxation of the *rente*, and his supporters in the Chamber, who insisted on taxing the *rente*. On the important question of electoral reform there was no less necessity for compromise, since the Senate had in 1913 rejected the Chamber's Bill for departmental *scrutin de liste* with representation of minorities. In the matter of anti-clerical educational legislation, and in that matter only, was there a firm agreement.

The close of the 1913 session of the Chamber on Dec. 29, 1913, left the question of electoral reform and the budget still unsettled. In regard to the army controversy, a quarrel had arisen between Senate and Chamber, because the former insisted upon including the salaries of generals in a bill which the Chamber had prepared to increase the pay of officers. When the 1914 session was opened, January 13, M. Paul Deschanel and M. Antonin Dubost were re-elected president of the Chamber and president of the Senate, respectively. The Radicals in the Chamber indicated their anti-clericalism by electing as vice-president of the Chamber, Abbé Lemire, a priest who had rebelled against the authority of his ecclesiastical superiors. He resigned office on January 19, thanking the Chamber for its demonstration of sympathy. The work of the legislative session may best be summed up under the heads of (1) the army, (2) the schools (*défense laïque*), (3) electoral reform, and (4) the income tax. In regard to the first of these, the government continued to affirm that since the Three Year Law had been enacted it should be enforced; and a *loi des cadres* was designed to effect the reorganization which the Three Year Law made necessary in the constitution of the staffs and effectives of the various arms. But in their utterances outside the Chamber, some of M. Doumergue's supporters inclined to M. Jaurès' view, that the Three Year Law ought never to have been enacted, and, having been enacted, should at once be repealed. (2) In its zeal for anti-clerical school laws (*défense laïque*) the government could count upon greater loyalty from its adherents. The bill for the defense of the lay schools and for school attendance was passed by the Chamber on January 20 by 418 to 118 votes. On January 23 the Chamber proceeded to the consideration of the School Fund Bill. An amendment extending the benefit of subsidies to private as well as public schools was defeated on January 27 by 386 to 159, and the bill was passed by the Chamber on February 2, providing financial assistance exclusively for "lay" (non-Catholic) schools. M. Viviani, as minister of education, made a remarkable speech in the Senate, laying down the principle that teachers in public schools should observe religious "neutrality" by refraining from saying anything which might offend any of the

scholars. Morals were to be taught without supernatural sanction. The cases where public school teachers used their position to carry on a campaign against religion were to be considered as exceptions. In this connection it should be noted that July 7, 1914, was the date fixed, under the law of 1904, for the final closure of all congregational schools (schools conducted by religious orders). (3) In the question of electoral reform the cabinet's policy was completely stultified by the obstinacy of the Senate. On Dec. 18, 1913, the Chamber had voted by 330 to 161 an urgent resolution: "The Chamber, faithful to its votes of 1911, of 1912, and of Nov. 18, 1913, counts upon the government immediately asking the Senate to hasten its discussion of electoral reform, and maintaining before the Senate the principle of the *scrutin de liste* with representation of minorities, thrice affirmed by the Chamber and accepted by the eight preceding ministries." This M. Doumergue promised to do; but M. Clémenceau, upon whose powerful support in the Senate the government ordinarily counted, was unalterably opposed to the representation of minorities. Consequently the cabinet failed to secure the passage of its Electoral Reform Bill in the Senate, and on March 10 the Senate reaffirmed its adherence to a scheme of *scrutin de liste* without the representation of minorities. (4) The fourth measure, the income tax, which formed the central feature of the Cabinet's financial policy, encountered unyielding opposition in the Senate. A heated conflict was waged on the old question of the exemption of the *rente* from the income tax. With regard to this question, M. Caillaux, the minister of finance, was accused of having changed his attitude from day to day—first appearing to acquiesce in the exemption, and then demanding the inclusion of the *rente*—in order to cause a fluctuation in the prices of government securities on the Bourse for the profit of his friends. While both houses concurred in the clauses of the finance law which readjusted the taxes on real property and imposed taxes on movable property, including French and foreign securities, the dispute over the income tax was protracted until the end of the session, when the Chamber voted to incorporate the income tax into the finance law or budget of 1914, too late for the budget to be passed by the Senate and promulgated. Never since 1872 had the financial situation of France been worse, with a deficit of well-nigh 800,000,000 of francs staring the government in the face, and the budget for the current year not yet passed. A note should be added, recording the passage by the Senate on Feb. 20, 1914, of a bill regarding miners' pensions, which had been passed by the Chamber July 12, 1912; the bill was not particularly fortunate as a sample—about the only sample—of the government's benevolent interest in the welfare of the working classes, for a strike of the miners in March signalized their strong disapproval of the bill.

PARTIES AND PROGRAMMES. Throughout the spring the various political groups were much concerned about the general election which was to take place in April. The Unified Radicals and Radical Socialists were chiefly anxious to maintain their cabinet in power, by whatever means, in order that they might have the advantage of the powerful influence which the Cab-

inet, through the local prefects, was able to exert in favor of its own candidates. The campaign platform of the Radical Socialists demanded the income tax, was favorable to imperialism in colonial policy, was vague on defense and social legislation, but emphatic in declaring, "We must put an end to the privileges which are enjoyed by the 'free schools' (Catholic schools)." The Socialist Congress at Amiens at the close of January declared that it could not join in a new *bloc* with the Unified Radicals, and urged all Socialists to vote for Socialist candidates on the first ballot in the forthcoming elections; but the close coöperation which had marked the relations of the Unified Socialist and Unified Radical groups in the Chamber was to be extended to the second ballot, in which the Socialists were to give their "free support to candidates of other parties in proportion to the vigor and the distinctness of their opposition to the Three Year Law, war, Chauvinism, and the military-clerical coalition." But M. Allemane and a minority of the Socialists were unwilling to acquiesce in the electoral alliance with the Unified Radicals, and seceded from the Unified Socialist group, explaining their action in a manifesto as follows: "... The resolution voted at the international congress of Amsterdam, which forbade Socialists of all nations to enter into any *rapprochement*, coalition, or *entente* with the bourgeois political parties, has been trampled under foot by the leaders of the Socialist party. These leaders have hypocritically concluded an electoral alliance with the most despicable and the most criminal of all the bourgeois parties—the Radical party. . . . The principal resolution of the Congress (of Amiens) had the effect of making the Socialist candidates mere game-beaters for the Radical party. At the first ballot they will present themselves with the programme and the flag of the party; then at the second ballot they will present the votes of the workingmen on a silver platter to the Radicalism which imprisons and shoots the toilers who legitimately rebel against capitalistic exploitation." A second significant development in the political situation was the formation of a new group under the leadership of M. Aristide Briand. In December of the previous year his great speech at Saint-Etienne had proclaimed the necessity of forming a republican *entente* to protect the republic against demagoguery and revolution, and to pursue a policy of reconciliation in dealing with the Church; he supported the principle of the representation of minorities; and he attacked the Moroccan policy of M. Caillaux, which had necessitated the military conquest of Morocco, the development of the French army, and the return to the Three Year Law. On January 14 the formation of the new group, the Federated Parties of the Left (*Fédération des gauches*), was completed, and the party headquarters established in the *rue Saint-Honoré*. Some 127 parliamentarians were included in the Federation, among them ex-premier Barthou, Pierre Baudin, M. Millerand, Lucien Klotz, and M. Bérenger. M. Briand was, of course, elected president of the Federation; and with the effective assistance of M. Barthou he began vigorously to attack the Caillaux group, accusing the cabinet of equivocations, defending the Three Year Law, pleading for religious liberty as against oppressive anti-clericalism, denounc-

ing the idea of establishing a state monopoly of education, demanding the representation of minorities in the Chamber, and urging a programme of social legislation.

THE MURDER OF M. CALMETTE. While M. Briand in the Chamber conducted the attack on the ministry's political policies, M. Gaston Calmette, editor of the *Figaro*, did not hesitate to go even further, attacking, through the medium of his journal, the political integrity and personal honor of M. Caillaux, the minister of finance and the leading spirit in the ministry. M. Calmette accused M. Caillaux "of combining his public functions as minister of finance with those of president of the board of directors of a foreign bank; of having, by an inconceivable 'negligence,' aided his friends to make a successful speculation in *Rentes* on the Bourse; of having committed a dishonest act in suspending the operation of justice for the benefit of a 'crook' (in the Rochette case); of having declared in 1901 that he had 'quashed the income tax while having the appearance of defending it.'" M. Caillaux feared that M. Calmette would publish certain personal letters in proof of these allegations—letters which revealed the liaison which had existed between M. Caillaux and the present Mme. Caillaux while M. Caillaux was still the husband of another woman. Trembling for her husband's position and her own reputation, Mme. Caillaux purchased a revolver, practiced shooting with it at a target, and went to interview M. Calmette. Not intending to kill him, she said, she momentarily lost her reason, and found herself standing in M. Calmette's office, with a smoking, empty revolver in her hand, and M. Calmette lying mortally wounded at her feet. On the evening of the murder, March 16, M. Caillaux offered his resignation from the cabinet, and after some hesitation the resignation was accepted, M. Renoult becoming minister of finance to succeed M. Caillaux, M. Malvy becoming minister of the interior to succeed M. Renoult, and M. Raoul Peret, an under-secretary, being appointed minister of commerce to succeed M. Malvy. The following day, the Rochette scandal, to which M. Calmette had made reference in the *Figaro* a few days before the murder, was brought to the attention of the Chamber by M. Delahaye. It was alleged that in March, 1911, M. Monis, who was then president of the council, had interfered with the course of justice and had interrupted the trial of a swindler, M. Rochette, at the instance of M. Caillaux. M. Monis denied it. M. Barthou thereupon produced a letter, which the then *procureur général* had written, substantiating the charges. M. Monis then resigned his post in the cabinet as minister of marine, and M. Gauthier was appointed to the post thus vacated. After a parliamentary investigation, the Chamber on April 3 acquitted M. Caillaux and M. Monis of corruption, inasmuch as their personal pecuniary interests did not appear to be involved in the case; but reproved "the abusive interference of finance in politics and of politics in the administration of justice." If M. Caillaux was fortunate in escaping with nothing more than a reprimand in the Rochette affair, his wife was even more fortunate in receiving complete exoneration for the murder of M. Calmette. Her trial, July 19-28, was the sensation of the summer. A public reading in court

was given to the two love letters in which M. Caillaux had somewhat indiscreetly mingled political confessions with passionate protestations. M. Caillaux transformed the judicial inquest into a political contest by making in court an oratorical defense of his political policies, including the income tax, and strenuously repudiating the suggestion that he had acted as a traitor during the Moroccan crisis of 1911, when he had ceded a slice of the Congo to Germany. With great eloquence he avowed his love for France and protested that he was a true Republican and a patriot, whereas M. Calmette, he asserted, had been a Royalist in the pay of Germany. The acquittal of Mme. Caillaux, July 28, on the ground that she had not intended to kill M. Calmette, was therefore to be regarded as more in the nature of a triumph for her husband's political popularity than as a vindication of her own innocence.

ELECTIONS. The first ballot in the election of the new Chamber of Deputies was taken on April 16; in constituencies where no candidate received an absolute majority, a second ballot was taken on May 10. The revelation of his misconduct in the Rochette affair, and the scandals attaching to the Calmette murder case, might well have been expected to interfere with the reelection of M. Caillaux to the Chamber. As a matter of fact he did find it necessary to fight a duel with his opponent, M. d'Aillières, as a result of the latter's veiled allusion to the Rochette affair. But in spite of all, M. Caillaux was victorious, and his party, the Unified Radical and Radical Socialist group, gained four new seats in the Chamber. The Unified Radicals, oddly enough, in their electoral campaign revived the programme of the Congress of Pau, which emphatically demanded a return to the two-year term of military service. The revival of the hitherto neglected anti-militarist plank of the platform was easily to be explained by the Radicals' desire to obtain Socialist support in the elections; but it was hardly in consonance with the policy which the Radical ministers in the cabinet had enunciated, of regarding the Three Year Law as an accomplished fact. The general result of the election was a clear vindication of the Three Year Law, an overwhelming demand for Proportional Representation, and an almost even division of opinion on the income tax. As regards the strength of the various groups in the Chamber, accurate figures are difficult to ascertain, on account of the absence of clear-cut lines between some of the minor groups; but it may at least be stated that the number of Unified Socialists was increased from 75 to 101, the number of Unified Radicals and Radical Socialists was increased from 168 to 172, and the *Fédération Républicain* (progressist) lost 38 of its 76 seats. The remarkable gains made by the two Unified groups may at least in part be attributed, first to their coöperation at the polls, and in the second place to the freely exercised power of the administration to influence elections. A new arrangement in the seating of the deputies was made, so that 11 sectors in the hall were marked off, each for a fairly distinct group, as follows: (1) on the extreme Left sat 101 Unified Socialists; (2) to their right sat 23 Republican Socialists; (3) 172 Unified Radicals and Radical Socialists; (4) a new group of 21 members, called the Republican Union, and in-

cluding M. Barthou, M. Klotz, and M. Millerand; (5) the Radical Left of 66 members; (6) the 54 Republicans of the Left; (7) the Democratic Left with 34 deputies; (8) the 36 progressists of the Republican Federation; (9) the Action Libérale with 23 members; (10) the Right, of 15 members; and (11) on the extreme Right a sector occupied by 44 "*non inscrits*" who refused to affiliate with any group. There were still 11 members who had not yet announced their party, and two vacant seats, bringing up the total number of seats in the Chamber, which had been increased by five, to 602. The Federated Parties of the Left, organized by M. Briand, it should be observed, did not form a distinct group in the Chamber, but rather included deputies in several sectors.

THE SHORT-LIVED RIBOT CABINET. The newly elected Chamber assembled on June 1. On June 2 the Doumergue cabinet resigned. In recognition of the increased strength of the extreme Left, President Poincaré selected René Viviani, a Republican Socialist, to succeed M. Doumergue, but by pronouncing in favor of the Three Year Law M. Viviani lost the support of the Unified Radical *comité de la rue de Valois*, which had officially condemned three year military service. M. Viviani was therefore unable to form a cabinet. The veteran leader of the progressists, Ex-Premier Alexandre Ribot, on June 9 formed a remarkable ministry from the moderate elements of the Left and Centre:— president of the council and minister of justice, Alexandre Ribot (*Union Républicain* of the Senate); foreign affairs, Léon Bourgeois (Democratic Left, S.); interior, Peytral (Democratic Left, S.); finance, Clémentel (Radical Left, Chamber); war, Théophile Delcassé (R. L., C.); marine, Emile Chautemps (Dem. Left, C.); education, Dessoys (Rad. Left, C.); public works, Jean Dupuy (Union Rep., S.); commerce, Marc Réville (Rad. Left, C.); agriculture, Dariau (Republican of the Left, C.); colonies, Maunoury (Rad. L., C.); labor, Abel (Rad. Left, C.). In his declaration of policy, M. Ribot advocated a loan to equilibrate the budget, a general tax on income, economy, maintenance of the Three Year Law, protection of the lay schools, an agreement on electoral reform, development of insurance, and provident institutions. But the two Unified groups and the Republican Socialists voted solidly against M. Ribot, crying, "Down with the Three Years!" and overthrowing the ministry on its first vote of confidence (June 12) by 306 to 262 votes. In the meantime M. Viviani had come to an understanding with the Unified Radicals, and was now able (June 13) to form a cabinet as follows: President of the council and minister of foreign affairs, René Viviani (Republican Socialist); interior, Louis J. Malvy (Unified Radical); justice, Bienvenu Martin (Democratic Left, Senate); war, Adolphe Messimy (Unified Rad.); marine, Armand Gauthier (Dem. Left, S.); finance, Joseph Nouvens (Unif. Rad.); education, Victor Augagneur (Rep. Soc.); commerce, Gaston Thomson (Rep. of the Left); colonies, Maurice Raynaud (Unif. Rad.); public works, René Renoult (Unif. Rad.); agriculture, Fernand David (Rad. Left); labor, Charles Couyba (Dem. Left, S.). Although 5 of the 12 were Unified Radicals, more than half of the new ministers had voted for the Three Year Military Service Law of Aug. 7, 1913; and the cabinet as a whole

pledged itself loyally to apply the law, and to introduce bills for the military education of the youth, and the reorganization of the reserves. The antimilitarism of the United Radicals was apparently laid aside. For the rest, M. Viviani promised (1) an immediate loan, (2) an income tax, (3) a tax in 1915 on capital, (4) electoral reform; (5) and after the budget was settled, he would take up the defense of the lay schools, the reorganization of the schools fund, the control of secondary private schools, and post-graduate organization.—“By liberty, by propaganda, by action, the Republican party will defend the patrimony of the Revolution against the spirit of domination”; (6) finally, “it is necessary to amend the law regarding workingmen’s pensions, and include pensions for invalidity, extend the domain of insurance to involuntary unemployment, and endow with more efficacious legal powers the professional syndicates in which the laborers learn by experience to accustom themselves to responsibility and to work for their economic enrichment.” On the vote of confidence, M. Viviani failed to obtain the support of the United Socialists, but was assured a safe majority by the various Radical groups. Almost immediately he induced the Chamber to overcome its repugnance to borrowing, and a loan of 800,000,000 francs was authorized by the Chamber on June 19, passed by the Senate the following day, emitted July 7, and largely oversubscribed. The budget passed by the last Chamber was passed with few changes now, and in it was incorporated a general income tax, calculated upon a scale which had the effect of levying a tax of 200 francs on an income of 25,000 francs, 700 francs on an income of 50,000 francs, and so on. After the close of Parliament in the middle of July, M. Viviani accompanied President Poincaré on a visit to Russia and the Scandinavian countries, a visit which was unfortunately interrupted by the sudden precipitation of an international crisis at the end of July.

FRANCE IN WAR-TIME. The great war had come at last, the war in which France would have an opportunity to retrieve the disaster of 1870–71 and regain Alsace-Lorraine. The war found France unprepared. The sensational Cailaux trial, terminated just as Austria-Hungary was declaring war on Serbia, had excited party feelings to an extreme degree. The dispute over the restoration of three year service in the army had not yet been definitely settled, and uncertainty in this respect had weakened the fundamental organization of French defense. While the Viviani cabinet outwardly consented to the Three Year Law, a strong agitation was being carried on for the repeal of the law, and the Chamber had elected to the army commission 22 antagonists along with 22 supporters of the longer term of service. During the spring sensational arraignments had been made of the inefficient military administration. As late as July 13, M. Charles Humbert, speaking in the Senate, had made a startling revelation of glaring deficiencies in the equipment of the French army; and M. Clémenceau had been moved to exclaim, “We are neither defended nor governed!” When the Chambers met in their historic session at the outbreak of the war, heard the ministry’s justification of the French cause, listened to M. Poincaré’s impassioned appeal to their patriotism, and voted the war supplies unanimously, pessimism gave way to resolution.

The French were probably calmer than any nation; but no nation could boast a greater determination. At the beginning of the war it was feared lest the Socialists and Syndicalists, who had so strenuously opposed the Three Year Law, would be disloyal. Obsessed by some such fear, a fanatic assassinated the great leader of the United Socialists, M. Jaurès (consult article JAURÈS); but there was in fact no cause for alarm. The Socialists in France, as in other countries, responded in the crisis with spontaneous loyalty. Two of their leaders, Sembat and Guesde, consented to enter the cabinet, which was reorganized on August 26 so as to include Alexandre Ribot, Aristide Briand, Alexandre Millerand, Gaston Doumergue, and that most zealous patriot and able diplomat, Théophile Delcassé. The enlarged cabinet was thus constituted: Premier, René Viviani; foreign affairs, Théophile Delcassé; war, Alexandre Millerand; justice, Aristide Briand; interior, Louis Malvy; marine, Victor Augagneur; finance, Alexandre Ribot; public instruction, Albert Serre; public works, Marcel Sembat; commerce, Gaston Thomson; colonies, Gaston Doumergue; agriculture, Fernand David; labor, Bienvenu Martin; without portfolio, Jules Guesde. On September 3 the government moved from Paris to Bordeaux; but in December, after the menacing German advance on Paris had been repulsed, the cabinet was able to return to Paris. On December 22 a war session of the Chambers was convoked in Paris, and on December 23 a war budget for the first six months of 1915 was unanimously voted by both houses. It suspended the income tax until 1916, and called for the huge sum of 8,500,000,000 francs, in addition to the 6,700,000,000 previously authorized. M. Ribot announced that France had advanced 250,000,000 francs to Belgium, 90,000,000 francs to Serbia, 20,000,000 francs to Greece, and 500,000 francs to Montenegro.

One of the most noteworthy results of the war, as far as the internal affairs of France were concerned, was the manifestation of tremendous loyalty on the part of the Royalists, Conservatives, and Clericals, who had been so bitterly accused by the Radicals of enmity to the republic. Most remarkable of all was the patriotism which compelled thousands of members of religious orders to return from the exile which the anticlerical Third Republic had forced upon them, and to offer their services to their country. Many thousands of priests were enlisted in the army, and fought side by side with the soldiers, or else acted as chaplains, winning praise for their courage and devotion. There was, moreover, a great revival of religious enthusiasm, not only among the women who thronged the churches praying for their husbands and sons, but also among the men, who, in the face of death, abandoned their indifference to religion. The celebration of the fête day of King Albert of Belgium was a demonstration of the great Catholic revival as well as a touching tribute to the “king without a country.” With renewed hopefulness the Catholics began to speak of the resumption of diplomatic relations with Rome as a possibility of the near future; and it was repeatedly brought to notice that the new Pope, Benedict XV, and his secretary of state, Cardinal Gasparri, cherished feelings that were distinctly friendly towards France. While such prognostications were probably tinged with

undue optimism on the part of the Catholics, at least it seemed certain that the struggle against "clericalism" in France had lost some of its bitterness, and that the manifest patriotism of the French Catholics would render future attacks on the Church as the enemy of the Republic extremely unlikely.

The tacit reannexation to France of those parts of Alsace-Lorraine which were occupied by French armies, needs only to be mentioned here, as its importance depended entirely upon the issue of the war. It should also be noted that Algeria and the other French colonies appeared, so far as information was obtainable, to have remained quiet during the war, and to have furnished a considerable number of native troops to fight on the battlefields of Europe. One other circumstance connected with the war deserves at least passing notice, and that is the mysterious mission of M. Caillaux to South America. At the beginning of the war M. Caillaux's well-known ability as a financier won him a post as paymaster for one army corps, with rank equivalent to that of colonel. According to a story which received wide circulation in November and was not subsequently denied, M. Caillaux found the life at Bethune, where he was stationed, inexpressibly dull, and for relief visited Paris; for this breach of discipline he had been punished by fifteen days' military detention. Subsequently he had come to blows, it was alleged, with an English officer, and on the complaint of the English commander-in-chief M. Caillaux had been dispatched to South America. Another story is that he had been approached by Germany in an effort to bribe France with Alsace-Lorraine. FRANCHISE, REFORM OF. See *FRANCE, History*; *BELGIUM, Electoral Reform Agitation*, etc.

FRANCIS FERDINAND, CHARLES LOUIS JOSEPH MARIE OF AUSTRIA-ESTE. An Austrian Archduke, nephew of the Emperor Francis Joseph and late heir-apparent of the Austro-Hungarian monarchy, assassinated June 28, 1914. He was born in Graz, in the province of Styria of which his father was Governor, on Dec. 18, 1863. He was the eldest son of the Archduke Charles Louis, second of the three younger brothers of the Emperor Francis Joseph. The eldest of these three younger brothers was Ferdinand, who, under the name of Maximilian I, was the ill-fated Emperor of Mexico. To the Emperor Francis Joseph were born three children. The eldest of these was a daughter, the Archduchess Gisela; the second a son, the Archduke Rudolph; and the youngest a daughter, the Archduchess Marie Valerie. Under the laws of the Hapsburgs the eldest son is the heir to the throne, and thus the Archduke Rudolph until his tragic death on Jan. 30, 1889, was the heir-apparent. The wife of the Archduke Rudolph gave birth to no son; their only child was a daughter. The Emperor's eldest brother, Maximilian, Emperor of Mexico, was executed in 1864, leaving no children. On the death of the Archduke Rudolph the Emperor immediately recognized his second brother, the Archduke Charles Louis, as heir to the throne. He, then 56 years of age, declined the succession, saying that he was too advanced in years. He died in 1896. The succession then fell to Charles Louis's eldest son, the Archduke Francis Ferdi-

nand. While his cousin, Rudolph, was being educated for the throne of the Empire, the tutors of Francis Ferdinand, whose prospects of becoming Emperor were then remote, were training him along strictly military and engineering lines, and within these lines he became an expert. He was commissioned a lieutenant in the Fourth Dragoons. His life as a young man was on the whole free from the scandal which was attached to many of the other members of the royal family of Austria. His earliest prominence was achieved by hismorganatic marriage with the Countess Chotek (born at Stuttgart, March 1, 1868), lady in waiting to the Archduchess Isabela, wife of the Archduke Frederick. This marriage was strongly opposed by the Emperor and other members of the court, but nothing could move the Archduke's determination. He even expressed his willingness to give up his right to the throne in order that he might be allowed to marry as he wished. On June 28, 1900, the Archduke took an oath that he and the Countess would consider their projected marriage asmorganatic and renounced for the Countess all future claims as Empress and for their unborn children all claims to the throne. Three days later on July 1, 1900, they were married. The Emperor then made the Countess Duchess of Hohenberg. Among the Magyars and the Slavs of the Empire there was strong opposition to the renunciation of these rights. This opposition crystallized in the Hungarian Reichsrath into protests against permitting the household laws of the Hapsburgs to override the Hungarian Constitution, which does not recognizemorganatic marriages. These protests, however, had no effect. During the first years after his recognition as heir-apparent Francis Ferdinand had little to do with the governmental policies of the Empire. In recent years, however, he took over much of the detail of government from the aged Emperor. He gave his attention particularly to military and naval matters, reorganizing the army in a manner that aroused the admiration of European military authorities. Francis Ferdinand was credited with the ambition of restoring Austria to a dominant place in European politics. It is said also that he had an ambition to make his throne the moral protector of Pan-Slavism. The fact that his wife was a Slav and that she unquestionably exercised great influence over him was felt to have a strong bearing on this phase of the future of Austria. The alliance with Italy received no sympathy from the Archduke. He had the national distrust of the Italians and this feeling was heightened by his devotion to the Roman Church. The Archduke was credited with a large share in the annexation of Bosnia and Herzegovina in 1908, and this aroused feelings of hostility against him in these provinces and in Servia. The personality of the Archduke was not of the sort to make him a popular figure. His nature was cold and reserved and he made few friends. He is said to have been feared and disliked to a degree that blinded people to his real merits, which indisputably were great along certain lines. His relations with the Emperor were at times strained. During the frequent illnesses of Francis Joseph, a far greater degree of power was vested in the hands of Francis Ferdinand than had ever been intended by his uncle, and the Emperor's quiet and determined efforts to restrain him created

a situation which frequently proved a cause of great embarrassment to the ministers of the Crown and to the commanding officers of the army and navy. Francis Joseph visited the United States in 1893, crossing the country from San Francisco to the Atlantic seaboard, and attending the Columbian Exposition at Chicago. He showed his acute powers of observation in the diary of the trip, which he published for private circulation on his return. The Archduke and his wife were shot by a Serbian student during a visit to Sarajevo, the capital of Bosnia. For further details in regard to this event and those which followed, see *AUSTRIA-HUNGARY, SERBIA, and WAR OF THE NATIONS*. Three children were born to the Archduke and his wife.

FRANZ JOSEF LAND. See, under section entitled as above, *POLAR RESEARCH, Arctic*.

FRASER, ALEXANDER CAMPBELL. A Scotch scholar and educator, died Dec. 3, 1914. He was born in County of Argyll, Scotland, in 1819, and was educated at Edinburgh University. In 1846 he became professor of logic at New College, Edinburgh, which post he held until 1856, when he was appointed professor of logic and metaphysics at Edinburgh University, succeeding Sir William Hamilton. From 1850 to 1857 he was editor of the *North British Review*. Dr. Fraser was Gifford lecturer in natural theology at Edinburgh from 1894 to 1896, and received many honorary degrees, among them that of D.C.L. from Oxford in 1883, LL.D. from Princeton in 1856, and Litt.D. from Dublin in 1902. Among his published writings are: *Essays in Philosophy; Essays, Philosophical and Miscellaneous; Locke as a Factor in Modern Thought; and Berkeley and Spiritual Realism*.

FRASER-TYTTER, SIR JAMES MACLEOD BANNATYNE. A Scotch soldier, died Feb. 2, 1914. He was born in 1821 in Inverness-shire. He early entered the military service and distinguished himself in the first Afghan campaign and also in the Punjab campaign of 1848-49. His reputation as a fearless fighter, however, was won during the Indian Mutiny. During the street fighting which occurred in Lucknow his horse was shot under him, and he was himself dangerously wounded. He was highly praised by Sir Henry Havelock. He received for gallantry during this period a medal and the brevet of colonel. In 1864 he was sent to relieve the officer commanding the left column of the Bhutan Field Force, and in a very short time recaptured all the posts previously lost by the British. In 1871 he was appointed to the command of the Allahabad Division, and later to that of the Umballa Division. He retired in 1879 after an active service of 37 years.

FRENCH, SIR JOHN DENTON PINKSTONE. A British soldier, born at Ripple Vale, Ripple, Kent, Sept. 28, 1852. He was a naval cadet and midshipman for four years. After entering the army he served in the Sudan and Natal, and in the Boer War was a commander of cavalry, being promoted rapidly for distinguished conduct. He commanded the first army corps in 1901-07, in the latter year was made general,

then was inspector general of the forces until 1911 (as well as after 1914), chief of the imperial general staff (1911-14), and field marshal, after 1913. He was knighted in 1902, and received various decorations, besides honorary degrees from Oxford and Cambridge. For a discussion of his leading part in the European War, see *WAR OF THE NATIONS*.

FRENCH, WILLIAM MERCHANT RICHARDSON. An American art critic and lecturer, died June 3, 1914. He was born in Exeter, N. H., in 1844 and graduated from Harvard University in 1864. He then took a special course in engineering at the Massachusetts Institute of Technology, and upon its conclusion became associated with a firm of engineers in Boston. Until 1877 he was engaged in civil engineering and landscape gardening. In the latter year he removed to Chicago and became associated with the Chicago Art Institute, then known as the Academy of Design of Chicago. He was chosen director of this institution in 1879 and held this position until the time of his death. He traveled extensively and lectured on art subjects in all parts of the United States, Canada, and in some cities in Europe. He was also prominent in literary circles and was at one time president of the Chicago Literary Club. He wrote much on art subjects and was active in the work of the Central Howard Association, whose aim is to give aid to former convicts. At one time he was president of this association. In 1897-98 he was president of the American Association of Museums.

FRENCH ACADEMY. See *ACADEMY, FRENCH*.

FRENCH CONGO. Now French Equatorial Africa (q.v.).

FRENCH EQUATORIAL AFRICA. Formerly French Congo. A French possession in equatorial Africa on the west coast, composed of Gabun Colony (capital, Libreville), the Middle Congo Colony (capital, Brazzaville), and the Ubangi-Shari-Chad Colony (capital, Fort-de-Possel). From the old area must be deducted roughly 280,000 square kilometers carrying a population of 1,000,000 inhabitants, ceded to Germany following the convention of March 4, 1912. This done, there remain 1,453,888 square kilometers with an estimated population of 9,000,000. This includes the territory ceded to France by Germany from the Kamerun country. The products and exports are rubber, ivory, timber, palm kernels and oil, cacao, etc. Gold, copper, and iron are mined. The chief ports are Libreville and Loango. The total imports amounted in 1912 to 19,987,455 francs, and the exports to 28,935,218 francs. The export of copper was valued at 850,000 francs. There entered at the ports in the 1911 trade, 124 vessels, of 282,657 tons; cleared, 124, of 280,804 tons. The budget for 1911 balanced at 15,263,000 francs; the debt stood, Jan. 1, 1912, at 14,784,000. The Governor-General (1914) was M. Merlin. Telegraph lines, 2023 kilometers; wires, 2175.

To obviate the use of the Belgian railway from Matadi to Leopoldville for access to her colonies, the French government decided to construct a railway from Pointe-Noir on the Atlantic coast to Brazzaville, in the neighborhood of Stanley Pool on the Congo River, and an appropriation amounting to about \$18,000,000 was voted towards the project by the French Chamber, but the war will delay construction.

FRENCH ESTABLISHMENTS IN OCEANIA. A southern Pacific French colony, composed of widely scattered groups and single islands. Papeete is the capital. Total area (recent estimate), 3998 square kilometers, with a population of 30,563. The value of the 1911 export of phosphate of lime was 238,000 francs. Total imports 1912, 7,747,181 francs; exports, 8,840,255. The debt stood, Jan. 1, 1912, at 60,784 francs. The budget for 1911 balanced at 1,745,000 francs. Vessels entered in the 1911 trade, 67, of 166,588 tons; cleared, 65, of 164,513 tons. The Governor was W. M. Fawtier.

FRENCH GUIANA (CAYENNE). A French colony and penal settlement on the northern coast of South America. It covers 88,240 square kilometers, with a population in 1911 of 49,000. Cayenne, the chief town and only seaport, had (1906) 12,426 inhabitants. Gold mining (placer) is the chief occupation of the people. Imports, 1912, 10,857,307 francs; exports, 12,117,488. Export of mining products, 10,277,000 francs. Total tonnage in the 1911 trade, 57,172. The budget balanced for 1911 at 4,187,000 francs. The Governor was F. E. Leveque.

FRENCH GUINEA. One of the colonies composing the French West Africa government-general. The capital is Conakry, with 6623 inhabitants; Kankan, the chief commercial centre, has 7120; Boké, 3527; Kindia, 2280; Dubreka, 1195. The principal product of the soil is rubber, gathered throughout the colony, but especially plentiful in the Futa-Jallon, the Farana region, and in certain districts of Upper Guinea. Rice is cultivated as well as millet, manioc, sesame, and roots. Palm kernels and gums are gathered. Throughout the colony grazing is practiced, and the Fullahs maintain great herds of sheep and goats, cattle, and a few horses. The exportation of live animals has grown steadily; in 1904 the number of cattle exported was 4628, increasing to 9785 in 1908, and 10,087 in 1912. Most of these animals go to Sierra-Leone and Liberia. The total imports in 1912 were valued at 19,274,130 francs—cotton textiles, 8,686,285 francs, other textiles, 688,047; rice, 539,816; tobacco, 528,516; wines, 453,311, etc. Total exports, 20,057,925 francs—rubber, 15,095,689; live animals, 1,358,906; palm kernels, 1,026,969; hides and skins, 1,107,046; gum copal, 232,990, etc.

Transport from and into the interior is by caravan; the route from Conakry to the Niger, known as the Leprince route, is via Kinda, Timbo, and Kouroussa. There is a railway from Conakry to Kouroussa on the Niger, a distance of 588 kilometers. A branch of 74 kilometers runs from Kouroussa to Kankan; it was to be finished and opened to traffic by the end of 1914. Lieutenant-Governor, J. Peuvergne. See FRENCH WEST AFRICA.

FRENCH INDIA. A group of five French dependencies in India, covering 513 square kilometers, with 282,472 inhabitants. The towns are Pondicherry (the capital), Karikal, Mahe, Chandernagor, and Yanaon. The chief exports are oil seeds, raw cotton, and pulse. There is a railway from Pondicherry to Villapuram, and from Peralam to Karikal—in all, 30 kilometers. Imports 1912, 9,031,780 francs; exports, 37,218,209. Debt, Jan. 1, 1912, 4,844,000 francs. The budget of 1911 balanced at 6,038,000 francs. The Governor was A. A. Martineau.

FRENCH INDO-CHINA. A dependency of

France in southeastern Asia, made up of five States and a strip of territory leased from China, as follows:

	<i>Sq. kms.</i>	<i>Pop. 1911</i>	<i>D.</i>
Annam	159,890	5,542,822	85.0
Cambodia	175,450	1,487,948	8.0
Cochin-China	56,965	8,050,785	54.0
Laos	290,000	631,889	2.0
Tongking	119,750	6,117,954	51.0
Kwangchow-Wan *	1,000	158,881	159.0
Total	†803,055	16,990,229	21.0

* Leased territory. † 810,060 square miles.

Total population in 1906, 16,315,063. Hanoi (in Tongking) is the capital, with (1911) 113,676 inhabitants; Cholon had 191,665; Bin-Dinh, 75,000; Saigon, 64,845; Pnom-Penh, 54,621; Hué, 50,000; Vien-tiane, 20,000; Haiphong, 27,000. In the table below are given import and export values for three years in francs, trade returns being reported for the colony as a unit:

	<i>1910</i>	<i>1911</i>	<i>1912</i>
Imports	238,686,288	244,142,680	273,198,924
Exports	290,546,912	250,146,499	260,785,542

The production of coal and lignite in 1911 was 437,000 tons, valued at 5,217,000 francs, of which the quantity exported was valued at 2,201,000 francs; output of zinc was valued at 4,092,000 francs, of tin and tungsten, at 444,000 francs.

Some of the principal imports for consumption, and exports of domestic produce in the 1911 trade are shown in the table below, with values in thousands of francs.

<i>Imps.</i>	<i>1000 fr.</i>	<i>Exps.</i>	<i>1000 fr.</i>
Textiles	43,838	Cereal prods.	127,786

The budget for 1913—in piasters of 2 francs, 50 cents each—follows:

<i>Receipts and Expenditures</i>	
General budget	35,608,395
Tongking budget	8,226,710
Annam budget	3,976,980
Cambodia budget	4,803,000
Cochin-China budget	7,181,787
Laos budget	928,691
Kwangchow-Wan budget	296,022
Total	61,023,535

Vessels entered in the 1911 trade, 1839, of 1,681,893 tons; cleared, 1677, of 1,638,895 tons. Total length of railway, 1912, 1909 kilometers, including 467 kilometers in the province of Yunnan, China. The Saigon-Mytho Railway has an extension under construction to Cantho. The debt stood, Jan. 1, 1912, at 245,912,509 francs. Governor-General, 1914, J. van Vollenhoven.

FRENCH LITERATURE. BEFORE THE WAR. Up to the first of August things went on as usual in the French literary world. The trend of thought indicated in preceding years de-

veloped still further, realistic and merely entertaining literature lost caste, while moral, social, and especially religious preoccupations seemed to gain ground. Of this tendency, a number of books are plain evidence. Bourget's novel, *Démon de midi* attempts to show that most men face a crisis in middle life. It may be a love affair, social or political aspirations, or the lure of money speculations which threatens to wreck their whole lives. Their salvation, either by averting danger before or by restoring order afterwards, is found to rest in the Church. Bourget has proclaimed this for years, but what is interesting is that he who was preaching in the desert all these years, finds himself now voicing the sentiments of many of the new generation. Claudel, who is a convert, emphasized in his profoundly Catholic play, *L'otage*, the notion of sacrifice in one of its most repulsive forms, as the one thing that renders human life sublime. Another one of Claudel's plays, *L'échange*, written years before, when he was in Boston, Mass., was also produced. There are no religious preoccupations in it, but we are shown a sharp contrast between the consistently developed character of an American business man, and the consistently developed character of a new emancipated woman on the one hand, and the traditional European idler, artistic temperamentally, and the old and touching ideal of the devoted feminine woman, on the other hand. Barrès gives us *La grande pitié des églises de France*, a book of the most heterogeneous character, in which the author begs all Frenchmen to unite in saving and restoring the old churches as expressing the deepest ideals of the nation. Rodin published simultaneously his *Cathédrales de France*. Anatole France wrote *La révolte des anges*, bitterly sarcastic toward Catholic orthodoxy. These books are not perhaps the most widely read, but they are representative of the temper of the hour.

DRAMA. The religious trend of thought just emphasized is of course a reaction against the violent conception of life that still, perhaps, obtains with the general public. Specimens of this nerve-racking tendency in literature are, besides Claudel's *L'échange* just mentioned, D'Annunzio's *Chèvrefeuille*, which develops the Hamlet theme of vengeance carried out with refined cruelty; Curel's *Danse devant le miroir*; and F. de Croisset's *L'épervier*, one more most subtle and disagreeable analysis of hyper-sensitive beings. Lavedan in his *Pétard*, gives a powerful creation of a hero who is a worthy brother of Mirbeau's Lechat in *Les affaires sont les affaires*. *La force de mentir* of Bernard and Marullier is a weird farce. The same trend is seen in Vanderem, *La victime*. The "victim" is the child who suffers from the quarrels of its parents, is alternately spoiled by them during their separation, and whose conditions are not improved after the parents are reconciled and come together again. In Villiers de l'Isle Adam, *La révolte*, produced for the first time this year, the Nora theme is here developed. Among the plays of a purely witty kind, the following are worth noting: Flers and Caillavet, *La belle aventure*, and *Monsieur Brotonneau*; Sacha Guitry, *Les deux couverts*, and T. Bernard, *Le prince charmant*. Shakespeare continues to interest Paris, and *Hamlet*, *Macbeth* (Richopin), and *Twelfth Night* were given. Hervieu has not yet given up his fatalistic view of life, but there is a note

of noble resignation in *Le destin est maître*. Brieux, in *Bourgeois aux champs*, points out with his usual force another form of the mistake men make in looking for happiness where it is not, and not seeing it when it is right there. M. Donnay in *Georgette Lemeunier* (*reprise*) and Devon in *L'envolée* preach the same idea but with special regard to love. Arquillères, *Grande famille*, and Fabre, *Un grand bourgeois*, again suggest moral ideas which are only expressed in less catholic language than in Tristan Bernard's *Jeanne Doré* (played by Sarah Bernhardt), in Curel's *Nouvelle idôle* (*reprise*), or even in the printed drama of Schuré, *La Druidesse*.

POETRY. The crop is very meagre. As indicating the special source of inspiration in literature as a whole, we might mention first the long poem, *La geste de Jeanne d'Arc*, of A. P. Garnier. Ch. Péguy (killed in the war) in his *Eve* also brings in Joan of Arc. He was the famous editor of the *Cahiers de la quinzaine* in which he led a vigorous campaign against pedantry and philistinism, in favor of traditional Catholic France, and he was the author of a long poem in prose, *Le mystère de Jeanne d'Arc*. Other books of verse are: Savarit, *Élévations sentimentales*; Cécile Perrin (author of *Les pas légers*) writes *La pelouse*; Emile Herriot, *La flamme et les cendres* in which we find the delicate note of Sully-Prudhomme. P. Claudel publishes *Deux poèmes d'été*. A few months before the war E. Raynaud issued an elaborate volume, *Les deux Allemagnes* (bureaucratic and intellectual Germany). In this he expressed the hope that the enlightened people of the two countries would come to a better understanding of one another. A poet from San Domingo sent a greeting, entitled *Nostalgies françaises*, to his French fellow writers, who commented upon it with appreciation. Timothée Taret, a poet from Tahiti, publishes *L'âme vibrante*. A. Rivoire writes *Le plaisir des jours* in which we still see the influence of the Parnassian school. Cantuzène strikes the same note in his *Mes brouillards de roses*, in which death plays a great part. This Parnassian influence because of the stress put upon form is again seen in the *Cent sonnets* of Jaubert (he had published formerly *Cent ballades*). More symbolistic is John-Antoine Nau in *En suivant les Goëlands*. Two volumes entirely out of touch with the present tendencies are F. Lovio, *Derniers rondels païens*, and E. Payen, *Vaines étreintes* (published as expurgated by the court). Vaillant publishes *Chansons inédites de Gautier d'Argies*, a Picard trouvère of the thirteenth century, and M. Allem, the *Poèmes de jeunesse* by Alfred de Musset. The periodical *Terre Latine* in its April number made a syllabus to ascertain the attitude of modern poets towards free verse, inaugurated about thirty years ago by the Symbolists; 29 answers were favorable, 80 were unfavorable, and 28 noncommittal.

THE NOVEL. We have already quoted Bourget, *Démon de midi*, and France, *Révolte des anges*—the latter showing that even the skeptic cannot put away from him a problem which forces itself to the front, the former showing with what perfect frankness the religious, nay the Catholic, solution to this problem can be expressed. Juliette Adam (the famous *femme-de-lettres*), in her *Chrétienne*, is another striking illustration; for, thirty years ago, the authoress had published a *Païenne*, a violent anti-Christian manifesto.

Chrétienne is a "continuation" in which the heroine, who is the authoress, is converted. Y. Bertheroy, in his *Couronne d'épines* shows the woman finding in divine love a consolation against human love. Péladan in *Pomone*, the twentieth volume of the *Ethopée* started in 1884, shows also an evolution from purely pagan principles to Catholic ideals. Emile Bauman, *Baptême de Pauline Ardel*, offers the same theme as Curel in *Nouvelle idôle*, but in a much more affirmative manner, the great unbelieving scholar yielding to the consoling faith of his daughter, herself converted by a sincerely devout artist. Still betraying the same change of fundamental attitude towards the problems of life, Dulac in the *Vie et mort de M. Legentois*, shows us a professor (by accident) becoming master of a fortune. He need no longer think of the necessities of life. How then is he going to make use of his intellectual powers? He does nothing, and is almost as ridiculous as Bouvart and Péouchet. Again, a marked return to provisionally discarded ideas, although not looking at things from the religious side: P. Margueritte, the former apostle of divorce, offers in *Nous, les mères*, a touching character—Madame Gimones, a lady who has lived according to the old conservative laws of society, accepting many things which seemed very hard, and who now enjoys the most beautiful and dignified old age. Looking towards a future with youthful hope and new ideals are the heroes of Gachon, in *Vivre la vie*. In *Les survivants*, Behaine urges us to respect, but not to be the slaves of traditions; while A. Lichtenberger expresses the same idea with even more emphasis in *Le sang nouveau*. The hero, although far from reckless, is an ardent believer in a life which allows much initiative and risk, and to this view the energetic representative of conservatism is also won over. M. Boulenger in *Le fourbe*, and L. Lefebvre in *La femme au masque* tell the oft-told story of the woman who is the victim of a silly or brutal husband. These two works are recorded here only because they come from pens which have won public attention in the past. P. Acker tells of the sad lives of the three Demoiselles Bertrand, girls without dowry. Lechartier is more in the new trend of ideas in his *Confessions d'une femme du monde*, whose heroine expresses her disappointment at society life, and enters on a career of generous sacrifice for the benefit of the poor and miserable. Two women whose names are rather well-known tell once more that the real woman of to-morrow is the woman of yesterday: In Louise Compain, *L'amour de Claire*, a feminist finally marries, and her child makes her become her true self again. In Marie Dauprat's novel, a blue-stocking is facing about in the same way, awkwardly at first, but unmistakably. The sad fate of the lower classes is depicted in Paul Brûlat, *La vie de Rirette* (the counterpart, as a girl, of *Poil de Carotte*); Lucien Descaves is not becoming less violent as he grows older. His *Barrabas* is the impersonation of the man who stands against the so-called social "order," and who is right in showing a spirit of revolt; Pierre Hamp, in *L'enquête* continues his series of novels proving by cold statistics that society must be reformed. Ch. Géniaux has a powerful novel of colonial life, *Notre petit Gourbi*. We find two "character novels" in Mille's extremely witty *Monarque*, (wit worthy of the author of *Tartarin*), and

Miomandre's *Thérèse Beauchamps*, which pictures the unwilling platonic love of a *petite bourgeoisie* of Montmartre for a very rich Chinese. H. Bordeau has written a *Croisade des enfants*. A "key-novel" which aroused some interest was Jules Case's *Salon de quai Voltaire*, picturing personalities of the period of Boulangism in Paris. Gyp in *La dame de Saint-Leu* put all her wit and life into describing a court intrigue of the English parvenue, Sophie Dawes, who, under the name of Baronne de Feuchères, tried to secure part of the fortune of the last of the Condés. The fantastic story is represented by A. Wylm in *L'amant de la momie*, and J. H. Rosny gives another of his "scientific" novels, *La force merveilleuse*, in which he imagines a change in the sun, sending to us, instead of the normal light, a light minus red, blue, or yellow rays. The result is a serious perturbation of life on the surface of the globe; it is supposed to be based on theoretic applications of known natural laws. Léon Gros, in *L'autobus évanoui* offers a similar, but amusing and ingenious application of scientific laws, in order to give the sensation of the miraculous.

SHORT STORIES. There are fewer volumes of short stories worth mentioning than usual. J. Lemaitre gives a delightful *Vieillesse d'Hélène*; Binet-Valmer, *L'homme dépouillé*, fearless psychological studies; Marc Le Goupils, in *Le carre-four*; and Gaumont and Ce, in *C'est la vie*, give us two stories of life in Normandy. These are evidently influenced by Maupassant. Owing to the agitated times in Alsace last winter, Hinzelin's *Légendes et contes d'Alsace* have attracted some attention. H. Duvernois's *Le chien qui parle* contains amusing stories in the manner of Courteline. Madeleine A. Picard's *En cueillant le jour* is a sort of feminine *maurivaudage*. Ch. Oulmont has published an anthology of the best love stories of French literature in his *Chapelet de fleurs amoureuses*.

LITERARY CRITICISM. The interest in mediæval literature seems to have somewhat abated. Yet L. Foulet's *Roman de Renard* is a masterly piece of work on a subject which is of international interest. P. Champion's *François Villon*, crowned by the Academy, is another splendid piece of work. Among the rather unusual number of books dealing with seventeenth century authors are: Denys Cochin, *Descartes*; Grappe, *Larochefoucauld*; Mme. Duclaux, *Madame de Sévigné*, and Lacour, *Maitresses de Molière*. In the eighteenth century we have Caussy, *Œuvres inédites de Voltaire*; Foulet, *Correspondance de Voltaire en Angleterre*; and Montesquieu's *Correspondance*. In the nineteenth century elaborate editions of Chateaubriand's *Correspondance*; of Stendhal's *Œuvres*; a popular edition of Vigny's *Œuvres complètes*; then books on Vigny, by L. Séché, and Dupuy; on Musset, by M. Donnay; on *Flaubert*, a series of valuable doctors' dissertations by Johns Hopkins men; finally Gustave Simon, *La vie d'une femme* (Mme. Victor Hugo), coming after his *Roman de Sainte-Beuve*. Georges Pellissier's *Shakespeare et la superstition Shakespeareenne* is an elaborate and destructive criticism of the playwright from the point of view of dramatic technique.

The French Academy has lost Jules Lemaitre, Henri Roujon, and Count de Mun; and has elected Bergson, Capus, and de la Gorce (an historian). No *grand prix de littérature* has been awarded because nothing seemed to deserve one.

Neither the Goncourt prize nor the prize of *la Vie Heureuse* has been awarded on account of the war. The famous Bibliothèque de Chantilly (Lovenjoul's collection, bequeathed to the French Academy) has been opened. Maeterlinck's works have been put on the index by the Catholic Church. Madame Sarah Bernhardt has at last received the Cross of the Legion of Honor. Paul Gavault has been elected Director of the Odéon theatre to succeed Antoine. The following deaths have to be recorded: Mistral, J. Claretie; Masson-Forestier, L. Séché; Jules Troubat (Sainte-Beuve's secretary); Pierre Sales; and Ch. Péguy, the most celebrated victim of the war in the literary world down to the close of the year.

DURING THE WAR. The celebration of the centenary of the Anti-Napoleonic Independence Wars in Germany, together with the Zabern affair in Alsace, favored, not a little, literature which proved later a good preparation for the war spirit. *Les Allemands à Paris sous le consulat de Napoleon*, by Holzhausen; *Au temps de l'épopée* (Napoleonic wars), *Lettre de Dupont d'Hervail, chef d'Etat major à la Grande armée*, published by Vaillant; Driault, *L'unité française*; General Cherfils, *Pour l'armée*; General Percin, *Le combat*. In the meanwhile scholars were writing such books as: *Histoire générale de l'influence française en Allemagne*, by L. Reynaud; or *Essais sur les littératures française et allemande*. After August 1, all writing commonly regarded as literature stopped; yet for one who does not take the word in a narrow sense, it may well be said to be rather the contrary. It is probable that never at any time in the history of France were all classes so absolutely united as they were at the close of the year. The *Revue des Deux Mondes*, the *Illustration*, the *Revue Hebdomadaire*, the *Annales*, did not stop publication; neither did such important newspapers as *Le Temps*, *Les Débats*, *Le Journal*, *Le Matin*. They contained pages from the pens of the best French writers, such as Barrès, France, Margueritte, Capus, Faguet, Lavedan, Doumic, Masson, and others, even of Maeterlinck, representing Belgium. The topics were the tactics of General Joffre, the gallantry of Generals Pau and Chastelnau, deeds such as the bombarding and sacking of Malines, Louvain, Reims, and Arras. The *Annales* was giving every week extracts from some of these remarkable pages. The articles by Barrès in *L'écho de Paris* were among the best. See also Maeterlinck's article on "King Albert" of Belgium in *Le Journal*, and the "Open Letter" of Romain Rolland, the author of *Jean Christophe*, to Gerhart Hauptmann, in the *Journal de Genève*. There were rumors that the French Academy was thinking of asking Maeterlinck to become one of them in spite of the fact that he is not of French nationality. Maeterlinck wrote to ask that his Belgian brother in the field of letters, Verhaeren, be chosen in his stead, to represent the allied nations in the Academy.

FRENCH NAVY. See NAVAL PROGRESS.

FRENCH SOMALI COAST. A French protectorate on the gulf of Aden. Official report gives area, 120,000 square kilometers, the population (1911), 213,000. Jibuti, with about 11,000 inhabitants, is the capital. There are 81 miles of railway in the country (the railway from Jibuti into Abyssinia). Imports, 1912, 32,341,017 francs; exports, 45,022,169 francs.

Vessels entered in the 1911 trade, 233, of 670,283 tons.

FRENCH WEST AFRICA. A French African possession composed of the following colonies and territories, with area and population (March 5, 1911):

	Sq. kms.	Pop.	D.*
Senegal	191,640	1,250,590	7.0
French Guinea	238,988	1,787,346	7.0
Ivory Coast	825,228	1,216,284	4.0
Dahomey	97,200	878,504	6.0
Upper Sen. & Niger } ..	2,166,478	6,086,198	8.0
Mil. Ter. of the Niger }			
Mauritania	893,696	225,154	0.2
Total	3,913,280†	11,844,076	3.6

* Density. † 1,151,900 square miles.

Dakar (Senegal), with 25,630 inhabitants (of whom 2397 French), is the capital. For details of production, etc., see articles on the separate colonies and territories.

The total value of all imports for 1912 was 134,781,892 francs; of this total, imports valued at 55,336,990 francs came from France, 2,516,518 francs from French colonies, and 76,928,474 francs from other countries. Total exports, 118,567,231 francs; of which, exports valued at 57,614,182 francs were received by France, 95,281 francs by French colonies, and 60,857,768 francs by other countries. At the ports of Senegal there were entered in the 1911 trade, 943 vessels, of 2,009,078 tons; French Guinea, 613, of 697,630; Ivory Coast, 380, of 843,927; Dahomey, 468, of 620,359; Mauritania, 27, of 1141. The total debt stood, Jan. 1, 1912, at 156,277,336 francs. The Governor-General in 1914 was A. W. Merlaud-Ponty.

FRIEDMANN "REMEDY." See TUBERCULOSIS.

FRIENDS, RELIGIOUS SOCIETY OF. There are four bodies of Friends: the Orthodox, Liberal (Hicksite), Wilburite, and the Primitive. The Orthodox branch is the largest. It has, according to the latest statistics (1913), 100,568 members, 90 churches, and 1325 ministers. In the Liberal branch there are 19,597 members, 211 churches, and 98 ministers. In the Wilburite there are 3880 members, 48 churches, and 47 ministers; in the Primitive, 171 members, 8 churches, and 10 ministers. The Liberal branch shows increased activity of late. The biennial general conference held at Saratoga Springs, N. Y., in September, 1914, was well attended, and addresses were made by many prominent speakers, some of them of national reputation. During 1915 three summer schools will be held under the direction of Liberal Friends, at Swarthmore, Pa., at Wayneville, Ohio, and in Canada.

FULL CREW LAWS. See RAILWAYS.

GAINES, REUBEN REID. American jurist, died Oct. 17, 1914. He was born in Sumter Co., Ala., in 1836, and graduated from the University of Alabama in 1855. He then studied law at Cumberland University and took the degree of LL.D. in 1857. In the same year he was admitted to the bar. He practiced law in Selma, Ala., until 1862, when he joined the Confederate army, where he rose to the rank of adjutant-general. At the close of the war he removed to Clarksville, Texas, where he engaged in the practice of law. In 1877 he was elected judge of the Sixth Judicial District of Texas, and held that office until 1885, when he was ap-

pointed to fill an unexpired term as associate justice of the Supreme Court of the State. He continued in this position until 1894. In 1897 he was appointed chief justice of the same court and held that post until 1911, when he resigned on account of ill health.

GALLIENI, JOSEPH. See WAR OF THE NATIONS.

GALLON, TOM. An English novelist and dramatist, died Nov. 4, 1914. He was born in London in 1866 and was educated privately. He started life as a clerk in a city office and next became usher in a large private school in London. He then became secretary to the mayor of a provincial town, but was obliged to give up the work on account of ill health. Starting on a tramp through the country, ideas for short stories occurred to him and he began to write. He produced a large number of novels and short stories, many of which are of considerable interest and well-written. His best known books are: *Tatterley* (1897); *A Prince of Mischance* (1897); *Rickerby's Folly* (1901); *Meg the Lady* (1905); *Jimmy Quizote* (1906). He also wrote several plays, including: *The Man Who Stole the Castle* (1900); *The Man in Motley* (1908); *The Devil's World* (1910); *The Great Gay Road* (1911).

GAMBIA, THE. A British crown colony and protectorate on the west African coast. The colony includes the island of St. Mary, British Kombo, Albreda, the Ceded Mile, and MacCarthy Island, situated between the falls of Barraconda and Bathurst. Total area of the colony proper, about 69 square miles. The protected territory covers about 4000 square miles, with an estimated population of 152,000. The chief tribes are the Jollofs, Mandingos, Sarahulis, Fullahs, and Jolas. The Jolas are pagans and totally uncivilized; the Mandingos and Sarahulis are mostly Mohammedans. The Fullahs practice agriculture and grazing. Total imports, 1912, £756,853, against £807,118 in 1911; exports, £735,172, against £682,036 in 1911. Revenue, 1912, £96,222 (£86,454 in 1911); expenditure, £81,340 (£71,390). Tonnage entered and cleared, 583,458 (480,911 in 1911). Most of the exports, principally ground nuts, go to France; 35.7 per cent of the import trade is from England. Bathurst is the capital and a port of registry. Governor, in 1914, Lieut. Col. Sir H. L. Galway (W. Telfar Campbell, acting).

GANNETT, HENRY. American geographer, died Nov. 5, 1914. He was born in Bath, Me., in 1846, and was educated at the Lawrence Scientific School, and the Hooper Mining School at Harvard University. From 1870 to 1879 he served at the Harvard Observatory and as topographer on the Hayden Survey. In 1882 he was appointed geographer of the United States Geological Survey and retained that position until his death. He was geographer to the tenth, eleventh, and twelfth censuses. In 1902 he was assistant director of the Census of the Philippine Islands, and of Cuba in 1907-08. In 1908-09 he was geographer of the Conservation Commission. He was one of the leaders of the movement for the organization of the National Geographic Society, was its first secretary, and became its president. He saw it grow from a handful of scientific men to a membership of more than 300,000. Mr. Gannett was also in a measure the originator of the Government map making work. As an author he wrote *Manual of Topographic*

Methods; prepared the Statistical Atlases of 1880, 1890, and 1900, and was the author of: *Commercial Geography*; *Dictionary of Altitudes*; and *Stanford Compendium of Geography*. He also compiled a number of gazetteers and was the author of: *The Contour Map of the United States*; *Magnetic Declinations in the United States*; and *Forest Conditions in the United States*.

GARBAGE AND REFUSE DISPOSAL. A rational and sanitary view of garbage disposal discloses the fact that the choice of a method of final disposal rests upon a variety of local conditions the nature and bearing of which can be determined only by careful engineering study. A growing recognition of this fact has led a number of cities to employ engineers to investigate the subject for them. As a rule such an investigation results in a recommendation for either (1) an incinerating plant to dispose of garbage, miscellaneous refuse, and a part or all of the ashes, or for (2) a reduction plant to convert the garbage into grease and fertilizer base, with perhaps a refuse-sorting and utilization plant to recover saleable paper, rags, bottles, and the like, and with the use of ashes for filling low land. Garbage and refuse disposal by use for filling low lands, by dumping at sea, or by feeding to hogs, are still practiced; each may be justified by local conditions, and there is a tendency of late to employ one or the other of the three instead of incineration or reduction. Obviously, dumping at sea is out of the question for most cities. In thickly populated districts, disposal by burial, by filling, or by feeding to hogs may be impracticable, thus leaving the choice between reduction and incineration. As either process may be conducted in a sanitary manner the choice will depend upon relative costs under local conditions.

REVERSION TO DUMPING AT SEA AND TO USE FOR FILLING. Berkeley, Cal., returned to disposal by dumping at sea a few months after the completion of a modern type of incinerator, during the year, and Seattle, Wash., had two of its incinerators idle and was restricting the use of the third one to the burning of dead animals and wholesale commission house refuse. At Berkeley, the return to sea dumping was said to have been due to a lowering of the contract price and a withdrawal of opposition to hauling the Berkeley refuse through Oakland streets to the dock after the incinerator was built and put in operation. At Seattle, the first of four proposed incinerators was built some years ago, Seattle being one of the earliest cities in the United States to build destructors of the British type. Careful daily records kept by the engineering department indicated good results from the incinerator. Later, two more plants were built, but meanwhile garbage disposal was transferred from the engineering to the health department, detailed record keeping seems to have been dropped, and it became necessary to largely rebuild the furnaces of at least one of the plants. Extensive use of the city refuse for filling low lands was practiced, at an officially reported cost of 14 cents per ton against \$1 a ton for incineration. The refuse was spread in layers, sprinkled with a chemical agent to prevent fly breeding, and covered with a layer of the cleanest of the available ashes. The layers are repeated until the desired surface level is reached, and where necessary, new material is added in spots

to restore the grade. Neither the Berkeley nor the Seattle changes in method of refuse disposal should be taken as proof that incineration, even locally, has been a failure, any more than the shutting down of reduction plants in some cities should be interpreted that they have been failures, without full knowledge of all the governing conditions. Nevertheless, at both these cities, there seems to have been at one stage or another a lack of engineering data or of acceptance of its proper interpretation, or else money would not have been laid out in incineration plants and then the plants shut down in a short time. Both incidents, as well as disposal by earth burial in some towns, and disposal by feeding to hogs in the case of a number of fair-sized cities, suggest that local conditions may render seemingly crude methods of garbage and refuse disposal quite satisfactory from a sanitary viewpoint, and much cheaper than incineration or reduction.

GARBAGE REDUCTION. A new method of garbage reduction, named the Cobwell, was announced just at the close of the year. Garbage is placed in a relatively small, air-tight tank of about three tons capacity, treated with a solvent at a low temperature so as to extract the grease without affecting the value of the tankage. The tankage, after bolting or grinding and screening, is in the form of a "meal." The high protein content of this meal, it was said, makes it valuable food for hogs or hens. The small size of the units promised to make garbage reduction commercially feasible for small cities and towns and the fact that the garbage is not exposed to the air during the treatment process was held to be greatly in its favor, since this lessens the chances for unpleasant odors. At the close of the year an existing private reduction plant at New Bedford, Mass., had been nearly changed over to the new system, a 100-ton plant was being installed at Los Angeles, Cal. (see *INTERNATIONAL YEAR BOOK*, 1913, for account of a notable contract here), and a small plant for the Panama-Pacific Exposition, at San Francisco, was under way.

For some 20 years after garbage reduction came into use all the works were owned and operated by private companies. A few years ago Cleveland, Ohio, built reduction works. During the year Chicago bought a local private plant which had been idle for a while and proceeded to enlarge it; Schenectady, N. Y., built one and Detroit, Mich., Akron, Ohio, and Dayton, Ohio, took steps to do so. At Chicago, it is proposed to burn the garbage and rubbish of the southern part of the city, in order to save a long haul of the garbage to the reduction works, and it is also proposed to establish a number of refuse-sorting stations to recover saleable paper, rags, and the like. At Akron the municipal garbage-reduction works will be close by the new sewage-treatment works and the sludge from the latter will be mixed with the garbage tankage to be made into fertilizer. Ultimately a refuse-sorting plant may be built alongside the Akron garbage and sewage works. At Dayton a private company reduced the garbage without cost to the city for 10 years, but on expiration of the contract in 1913 demanded \$10,800 for the service. After inviting bids for a new contract five times the city finally decided to build its own plant and provided a bond issue of \$55,000 for the purpose.

INCINERATION OF MIXED REFUSE, WITH STEAM UTILIZATION TO GENERATE ELECTRIC CURRENT. Although the heat from British refuse destructors is commonly used to raise steam for lighting or power purposes and although destructors of the British type in the United States are equipped with boilers there has thus far been but little heat utilization in this country except for works purposes. Early in the year a 600-kilowatt-hour steam turbogenerator was put in use at the Milwaukee incinerator, the current being sent 2 miles in an underground conduit and used to pump water for sewer flushing or cleansing. In March a garbage and refuse incinerator of the Heenan (British) type went into service at Savannah, Ga., a city of about 80,000 population, and since then steam from the incinerator boilers has been supplied to the waterworks pumping station, which is close by the incinerator house. The new Savannah incinerator has two 65-ton destructor units, two 200-horsepower water-tube boilers, an air preheater, a centrifugal fan for forced draft, a 150-foot chimney, a steam turbogenerator, to supply electric current for works, light, and power, wagon scales to weigh the incoming garbage, and various recording instruments. The incinerating plant cost \$126,271. On arriving at the plant the mixed garbage and refuse is dumped from wagons into a concrete storage pit below the ground level. This pit is 11x32 feet in plan and 20 feet deep and has a storage capacity of 260 cubic yards. The refuse is lifted from the storage pit by a hoisting grab bucket, moved forward by an overhead traveling crane, and dumped from the bucket into refuse containers of about one cubic yard capacity each, located over the destructor cells. Stoking is done through one set of doors, by hand, and clinking through another set of doors, mechanically. The clinker is pulled out by a hydraulic winch, attached to a plate described as "an upturned hoe placed on the bottom of the grate before the first charge of refuse is placed in the cell." From March 24 to September 30 a total of 14,364 tons of garbage, miscellaneous refuse, and some household ashes were burned, at a cost of \$8988 or 62½ cents per ton for labor, or 41.6 cents if the fuel saved at the pumping station were deducted. With sufficient refuse to operate at full capacity the labor cost would be reduced and the fuel saving increased. The unit cost given, it should be understood, includes no capital charges and no operating expenses except labor. During the same period a total of 18,033 tons of garbage, refuse of all sorts, and household ashes were collected and hauled to the point of disposal at an average cost of \$2.29 per ton, including labor, care of horses or mules, and repairs to carts and harnesses. The tonnage costs just given illustrate the higher cost of collection than of disposal. This is further illustrated by engineering estimates made late in the year for the collection and disposal of garbage, rubbish, and ashes at Albany, N. Y. Assuming a population of 120,000, a 106-ton incinerator for burning all garbage and rubbish and enough ashes to aid in combustion and produce a clinker suitable for concrete, with the remainder of the ashes disposed of by dumping to fill low land, the estimated annual cost of collection and disposal of all three classes of wastes was \$1.86 per ton for collection and \$0.30 per ton for disposal, after deducting the

value of steam and clinker. These figures are not directly comparable with the Savannah costs, because the Albany estimates are for all expenses, including 7.356 per cent per annum for capital charges, and because various local conditions in the two cities materially differ. At Albany the steam would be used to pump sewage.

REFUSE SORTING AND UTILIZATION. Where garbage is disposed of by reduction it is necessary to keep it free from miscellaneous refuse and from ashes. The ashes, if gathered separately, are useful in most cities for filling. The miscellaneous refuse contains saleable material, but this must be separated into kinds and from the unsaleable material. To do this most efficiently miscellaneous refuse is collected separately and hauled to a sorting plant. Of the relatively few such plants built the largest one is located at Pittsburgh, Pa., where the American Reduction Co., which has the contract for both garbage and refuse disposal, has for some years operated a garbage reduction plant and has recently built an up-to-date plant for sorting out saleable refuse and burning the useless remainder. A reinforced-concrete building 53x200 feet in plan and several stories high, with concrete slab roof supported on steel trusses, is located on a hillside so that the refuse wagons can dump on the upper floor and the marketable refuse and the ashes from the furnaces can be easily loaded on cars on a concrete railway trestle at a lower level along the other side of the building. The refuse wagons dump their contents into large storage hoppers, ingenious mechanical contrivances being used both to open the trap doors of the hoppers and to dump the refuse. Between the two parallel hoppers there is an inclined conveying belt. The refuse is pulled from the bottoms of the hoppers onto this belt. Sorters on either side of the belt pick out the different kinds of saleable refuse as it comes before them. Each sort of saleable material is then thrown into a separate bin, the hopper bottom of which is alongside a baling press on the floor below. Bottles go down a spiral chute of galvanized steel, are received on wood slats, and sorted into kinds. Tin cans go to a separate bin. The worthless refuse or tailings are taken by a traveling belt to a steel hopper, from which the material is passed through inclined chutes to either one or the other of two Stirling refuse destructors, each of which is equipped with a 250-horsepower water-tube boiler. After passing the boilers the hot gases go to a regenerator and heat air which is returned to the destructor to assist in the combustion of the tailings. The boiler steam is more than enough to drive the engines which generate electric current for works purposes. It is expected that the surplus steam will be sold. See *Engineering News*, April 30, 1914, for illustrated description of the Pittsburgh plant. Refuse utilization by a much different plan was practiced in Denver, Colo., under direction of the Board of Charities and Corrections. The refuse was taken to the municipal yard and there sorted and baled by transient men and women at the rate of about a carload a month.

GARDEN SUBURBS. See CITY PLANNING.
GAROFALO, ANTONIO. An Italian physician and medical writer, died in Rome in July, 1914, aged 47. He was editor-in-chief of the *Clinica Ostetrica*, and under the pen name of

Dr. Cajus was long prominent in matters relating to the organization of the medical profession. He was also for 17 years editor of a department in the *Policlinico*, which dealt with economic and other questions relating to the material side of medical practice.

GAS, NATURAL. The output of natural gas in the United States in 1913 was the greatest in the history of the industry. It surpassed that of any previous year in both quantity and value of gas produced. The returns, however, show a decrease in the quantity and total value of the gas consumed for domestic use in 1913 as compared with 1912, but an increase in the average price per 1000 cubic feet. This decrease in domestic consumption was offset by the increase in the quantity and value of gas used for industrial purposes, for which there was at the same time an increase in the average price per 1000 cubic feet. One of the important features of the industry in 1913 was the greater effort made to conserve the natural-gas resources of the country by saving the gas from oil wells by improved methods of drilling, by the installation of a greater number of plants for the extraction of gasoline from casing-head gas, and by the closing in of the "wild" well in Louisiana. Another important feature was the completion of pipe lines and the successful introduction of gas into cities and towns of Indiana from the great gas fields of West Virginia and the completion of the pipe line from the Midway field of California to southern California. Natural gas was introduced into Los Angeles and surrounding towns, the distance from the gas field to points of consumption being about 120 miles.

The total gas production in 1913 was estimated at 581,898,239,000 cubic feet, valued at \$87,846,677, an average price of 15.10 cents per 1000 cubic feet, as compared with a production of 562,203,452,000 cubic feet, valued at \$84,563,957, an average price of 15.04 cents in 1912. Of the total product, about 32 per cent was utilized for domestic purposes at an average price of 27.33 cents per 1000 cubic feet, and 68 per cent was utilized for industrial purposes at an average price of 9.4 cents per 1000 cubic feet. West Virginia produced in 1913 the largest value of natural gas, \$34,164,850. Pennsylvania was second, with \$21,695,845, and Ohio third, with \$10,416,699. The other States of chief importance are Oklahoma, Kansas, California, New York, and Indiana.

GAS ENGINES. See INTERNAL COMBUSTION ENGINES.

GASES. See PHYSICS.

GEMS AND PRECIOUS STONES. The total production of gems and precious stones in the United States in 1913 was valued at \$319,454, approximately the same as in 1912. The most important gem produced was the sapphire, the production of which was valued at \$238,635. Second in value was opal, valued at \$15,130; agate third, valued at \$8895; turquoise fourth, \$8075; diamonds fifth, \$6315. Diamond-mining was carried on in several of the States. The Arkansas diamond field received more active development in 1913 than in any previous year. Several hundred diamonds were found. In Alabama a beautiful diamond crystal was found in St. Clair County. It weighed 2.41 metric carats. The following table gives the precious stones found in the United States in 1912-13, with their value.

PRODUCTION OF PRECIOUS STONES IN THE
UNITED STATES, 1912-13

	1912	1913
Agates, chalcedony, onyx, etc.	\$9,978	\$8,895
Amethyst	863	389
Benitoite	150
Beryl, aquamarine, blue, pink, yellow, etc.	1,765	1,615
Californite	275	152
Catlinite
Chiasolite
Chlorastrolite	350
Copper ore gems, chrysocolla, malachite, etc.	1,085	2,850
Chrysoprase	220
Cyanite	10
Diamond	a 1,475	a 6,815
Diopside
Emerald	2,375
Epidote	10
Feldspar, amazonstone, sunstone, etc.	1,810	1,285
Garnet, almandine, pyrope, hyacinth, etc.	860	4,285
Gold quartz	1,900	300
Jasper, petrified wood, bloodstone, etc.	6,005	5,275
Opal	a 10,925	a 15,130
Peridot	8,100	375
Phenacite
Prase	25
Pyrite	265	50
Quartz, rock crystal, smoky quartz, rutulated quartz, etc.	2,448	1,640
Rose quartz	865	887
Rhodocrosite
Rhodonite	550	165
Ruby	2,260	200
Rutile
Sapphire	a 195,505	288,635
Smithsonite	650	50
Spodumene, kunzite, hiddenite	18,000	6,520
Thomsonite	450
Topaz	375	736
Tourmaline	a 28,200	7,630
Turquoise and matrix	10,140	8,075
Variscite, amatrice chlorutahlite, utahlite	a 8,450	a 6,105
Miscellaneous gems	4,408	2,920
Total	319,722	319,454

a Estimated or partly so.

The imports of precious stones into the United States in the calendar year 1913 were the largest ever recorded—\$45,431,998. This exceeded the imports of 1912 by \$4,068,673. The principal increase was in diamonds, the greatest increase being in rough or uncut stones. On the other hand, the imports of precious stones during the fiscal year ending June 30, 1914, decreased over \$15,000,000 in value from those of 1913. The large decrease may be explained by heavy importations during the middle of 1912-13 to take advantage of the duty then prevailing, since the increase of duty under the new law was expected. Changes in the duty on precious stones imported into the United States under the tariff act of Oct. 3, 1913, included the following: Diamonds and other precious stones, rough or uncut, not advanced in condition, are removed from the free list and made dutiable at 10 per cent ad valorem. Pearls, diamonds, and other precious stones, cut but not set, suitable for the manufacture of jewelry, are raised from 10 per cent to 20 per cent ad valorem.

DIAMOND PRODUCTION IN SOUTH AFRICA. The production of diamonds during the fiscal year 1913 by the De Beers Consolidated Mines amounted to 2,293,468 carats, as compared with 2,087,392 carats in 1912. Actual sales of diamonds amounted to £6,297,782. The Premier Diamond Mining Company produced 2,107,983 carats of diamonds and the value of the total production was \$11,216,000.

GENÉE, RUDOLF. A German Shakespearean reader and author, died Jan. 20, 1914. He was born in Berlin Dec. 12, 1824, studied wood carving under Professor Gubitz, and was a student in the Royal Academy of Art. He served as editor of the *Danziger Zeitung* in 1859-61, and of the *Koburger Zeitung* in 1861-64. From 1865 to 1887 he became widely known in all important German cities, in Russia, and in Vienna as a successful reader of Shakespearean plays. Genée wrote several noteworthy plays, of which the best, *Das Wunder*, a comedy, was performed at the Court Theatre, Berlin, in 1854. His other dramas include: *Ein Neuer Timon* (1856); *Vor den Kanonen* (1857); *Gastrecht* (1884); *Die Klausnerin* (1885). He also wrote many volumes on the history and development of the drama in Germany and England.

GENERAL EDUCATION BOARD. See UNIVERSITIES AND COLLEGES under section entitled as above.

GENERATORS. See DYNAMO-ELECTRIC MACHINERY.

GEOGRAPHICAL SOCIETY, AMERICAN. A body organized in 1852 for the purpose of investigating and disseminating new geographical information, with headquarters in New York City. During 1914 the society made large additions to its books and maps collections; provided 12 lectures for its members; gave five exhibitions of photographs and maps, which were attended by about 25,000 people; published under the title *The Memorial Volume of the Transcontinental Excursion of 1912 of the American Geographical Society*, 26 scientific papers, mostly by foreign participants in the excursion; and printed in its monthly *Bulletin*, which covers over 1000 pages annually, a comprehensive survey of all phases of geographical work, including literature and maps, throughout the world. The society has about 1200 members. The officers are as follows: President, A. M. Huntington; vice-presidents: Walter B. James, James Greenough, Anton A. Raven; foreign corresponding secretary, William Libbey; domestic recording secretary, Archibald D. Russell; recording secretary, Hamilton F. Kean.

GEOGRAPHIC SOCIETY, NATIONAL. The National Geographic Society, with headquarters in Washington, D. C., was organized and incorporated Jan. 27, 1888, "for the increase and diffusion of geographic knowledge." It has a total membership of more than 350,000. The society publishes the *National Geographic Magazine*, which goes to its members. Since 1900 it has made annual grants of money from its income for the promotion of geographic research. During 1913-14, in cooperation with Yale University, it has supported the geographical, geological, and archaeological researches of the Hiram Bingham Expedition to Peru. It has sent an expedition to Alaska to investigate the eruption of Mt. Katmai, another to the Caribbean to report on the eruptions of Mt. Pelée and La Soufrière, and another to Messina to study the earthquake there. Its expedition to Alaska for the study of the glaciers of that region spent three seasons in the field, and its report, covering the whole range of glacial behavior, has just been published by the society. The expedition of Robert E. Peary, which was successful in its effort to discover the North Pole, was in part financed by the society, as has also been the case with the Amundsen expedition, now in

Arctic waters. Henry Gannett, the president of the society, died Nov. 5, 1914. Gilbert H. Grosvenor is its director and editor.

GEOLOGY. Work in this science during 1914 resulted in the usual volume of contributions, altogether a literature of enormous proportions but which consisted for the most part of routine papers and reports or treatises upon local and special topics that make no very wide appeal. In the present article attention will be restricted to a few of the subjects under investigation and more particularly those having a more general scope or value. One of the principal fields of activity, naturally, was the preparation of areal maps, which is being carried forward quietly but steadily by governmental surveys in the United States, Canada, and other countries. The maps that are issued from time to time show the distribution and character of the rock formations and many other details; they are of great practical value to engineering, mining, and agriculture, and form the basis for much of the work of the independent investigator in the different branches of geology.

RECENT PUBLICATIONS. Among the year's publications may be named several new treatises as well as the final report of the proceedings of the Twelfth International Geological Congress which was held at Toronto in the summer of 1913. The latter volume contains a series of papers on selected topics, contributed by some of the foremost workers in their special fields, so that it is a valuable compendium for those who would follow the recent trend of thought. Note of some of the articles will be found in another place. To students of economic geology Lindgren's *Mineral Deposits* was perhaps the most interesting of the publications of recent date. It belongs to the limited class of notable works on a subject in which American geologists have long been prominently active. Compared with other treatises its distinctive feature is the emphasis placed upon the study of genesis as the guiding principle in the classification of mineral deposits. *Igneous Rocks and their Origin* is the title of the volume in which Daly has collected most of his recent researches and speculations, many of which have already appeared in print. A very practical text for field-workers is Leith's *Structural Geology*. Another work of importance is the *Principles of Stratigraphy* by Grabau which records the later advances in that department of geology.

ANTIQUITY OF MAN. A work entitled *Antiquity of Man in Europe* by James Geikie gives a résumé of the evidences bearing upon the history of the human race on that continent and seeks to correlate the data with the time scale of geology. In regard to the earliest or Chellean stage of development Geikie holds that it dates back to the second Interglacial epoch, while the succeeding Mousterian stage belongs to the third Glacial and the following Interglacial epochs. This is also the conclusion of the noted German investigator Penck who recognizes four Glacial and three Interglacial epochs. The Chellean industry is believed to be from 250,000 to 500,000 years old, and the whole Glacial period is placed at from 500,000 to 1,000,000 years. Man may have existed in Europe at the time of the first Interglacial epoch if not still earlier. These conclusions, it may be remarked, are supported by the facts revealed in the more recent discoveries of human

remains of which note has been made in earlier YEAR BOOKS.

PRE-CAMBRIAN FORMATIONS. The complexity of the problems surrounding the establishment of the sequence of the very ancient rocks included in the Pre-Cambrian is well brought out in the series of papers presented before the Congress of geologists held in Toronto, wherein a number of different schemes are proposed. These do not necessarily reflect differences of opinion in regard to the interpretation of the evidences, as they are largely the outcome of observations in separate areas. It is quite evident that the sequence of deposition is not the same in all areas, and the correlation of formations in widely separated regions is at present impracticable, or at least has no secure basis such as is available in the fossil-bearing formations. The prevailing tendency, apparent from the several papers read by geologists from the United States, Canada, Great Britain, Finland, and India, is to make use of such arrangement and terminology as are most suited to the region or country in which the observations have been collected.

ISOSTASY. The theory of isostasy, which considers the earth's crust to be in a state of delicate equilibrium and that the projections or mountain areas imply a deficiency of density in their substratum and the depressions like ocean basins an excess of density, has come into prominence as a topic of discussion among American geologists, largely perhaps from the strong support that it received by the investigations of Hayford, which were noticed in an earlier issue. One of the more important contributions upon the theory during the past year was that of Barrell, who gave a critical review of the articles hitherto published, and examined its competency to explain certain physical features. He was of the opinion that the larger segments of the earth—those of continental and oceanic proportions—are actually in isostatic balance, but that the minor irregularities which enter into the landscape, such as hills and valleys, have been sculptured by external forces and are sustained in their place by rigidity of the crust. Between the two extremes are mountain ranges, plateaus, and basins, in the production of which tangential forces, erosion, and sedimentation all have coöperated. The question arises, thus, as to just where isostasy begins to be effective. A test for that problem may be found in certain geologic processes like the building of deltas, the shifting of load upon the superstructure arising from climatic change, and in the features arising from erosion cycles. From them Barrell concludes that in the case of continents and oceans a high degree of isostasy is apparent, but, on the other hand, there is little of such adjustment within areas of moderate dimensions, up to 200 or 300 kilometers diameter, or in those of limited relief. Individual mountains and mountain ranges may stand by virtue of crustal rigidity. Even under level plains great loads are permanently borne, as instanced by the great delta plains. Isostasy, then, is perfect or imperfect or nonexistent according to the size and relief of the area in question. Isostatic adjustment takes place through movement in the subcrustal zone which transmits the pressure and equalizes the stress differences. This zone is of great depth and possesses plasticity, but is not actually fluid. It is a real zone be-

tween the lithosphere above and the centrosphere below and may well be called the asthenosphere or zone of weakness. This zone lies so deep that it is incapable of producing folding in the superjacent strata by drag, contrary to the view of some writers.

EARTH'S RIGIDITY. Michelson made some interesting experiments with a specially designed apparatus to determine the effects of the sun's and moon's attraction upon the shape of the earth. The same subject had been previously investigated by G. H. and Horace Darwin, but they were not able to attain any very definite results further than to show that the earth is a very rigid body. Michelson, however, succeeded in getting fairly concordant readings from his instrument which point to the conclusion that the earth's rigidity is greater than that of steel and that its viscosity is also of the same order of magnitude. Consequently the old view of a fluid or semifluid interior supporting a relatively thin crust seems definitely disproved, although the actual temperature in the interior is sufficient to produce fusion if the pressure were relieved. The result of the pressure is to increase the rigidity and viscosity. The results thus far obtained by Michelson lead to the hope that by the new method the earth tides may be measured with satisfactory accuracy.

PERMANENCY OF THE CONTINENTS. The permanency of the continents and ocean basins in a broad sense may be deduced, according to T. C. Chamberlin, from our knowledge of dynamic processes, notably isostasy, and from stratigraphic and paleontologic evidences. It may not be inferred, however, that there have been no encroachments of the oceans upon the continents or extensions of the latter at the expense of the seas; on the other hand, the dividing lines have shifted more or less in response to pressure from the sea or outward creeping of the land; but there is every reason to believe that the continents and ocean basins have always existed in their present approximate positions. Migrations of the shore lines have brought, now and then, continental mountain folds and blocks within the abyssal zone, and at other times sections of the sea bottom have been upraised into land. Certain areas have been subject to such movements more than others. The Antillean region where the two continental segments and the Atlantic and Pacific basins practically join is an unstable hinge area in which marked fluctuations of level have occurred for a long time in geologic history. The oceanic deposits of the island of Barbados afford perhaps the best proof of the lifting of a deep sea-bottom into land. Similar deposits on the islands of Haiti, Cuba, Jamaica, and Trinidad may be indicative of uplift from great depths, although in their case the evidences are less conclusive. Such disturbances are exceptional at any rate and do not affect materially the broad generalization that the ocean basins and continents are permanent. In Jamaica, Haiti, and Cuba the summits of the highest mountains are not mantled by such deposits, so that it is likely these islands suffered only moderate submergences.

VOLCANIC EMANATIONS. Additional results from the recent study of the Hawaiian volcanoes by American geologists have appeared, the most recent contribution being by A. L. Day, who reported upon the nature of the gases that issue from the vent of the Halemaumau crater.

Although the investigation of volcanic gases has been repeatedly undertaken by geologists, the results hitherto obtained have been open to more or less criticism on account of the almost insuperable difficulties encountered in securing samples free from contamination. In the present instance it is believed that the effort to secure pure samples has been successful. The gases present are water vapor, carbon dioxide, free hydrogen, and free sulphur, with chlorine, fluorine, nitrogen, and perhaps ammonia in small quantity. None of the rare gases was found. Inasmuch as contamination was avoided, it is concluded that the gases named participate in volcanic activity at great depth. At the temperature at which they issue, they cannot be in equilibrium, but are in process of change by which they give out much heat and thus are probably potent agents in maintaining fluidity in the lava. The absence of argon from the list of gases indicates that a meteoric source of supply is out of the question. The presence of water vapor was established beyond all doubt, and Day thinks that the compound is traceable to reaction of the hydrogen with sulphur and carbon dioxides.

UNDERGROUND WATERS. The origin of the deep-seated waters which play an important part in the phenomena of volcanism and through their work of solution and deposition of mineral materials contribute to the formation of ore-deposits is a problem that has received much attention. Two general theories are currently held: according to the one the waters are magmatic or a constituent part of the highly-heated core of the earth—the so-called juvenile waters of Suess; the second explanation is that they are a part of the meteoric supply carried down into the earth so far as to reach the region of high pressure and temperature. The difficulty in the way of accepting the latter explanation is to account for the penetration of surface waters through the great thickness of rocks which necessarily increase in compactness with depth. Capillarity has usually been appealed to as the chief factor in promoting passage of the waters, and of its agency geologists have sought confirmatory evidence in the experiment of Daubrée, who showed that water will penetrate sandstone against a certain pressure of water vapor. A recent contribution from the Carnegie Geophysical Laboratory by Johnston and Adams reviews the work of Daubrée and points out that the conditions of his experiment are far from being the same as are met with in the capillary movement of waters in the earth. Moreover, the amount of water that can pass through rocks whose pores are small and discontinuous is relatively small below depths of 500 meters, although minor quantities may penetrate to 1500 meters. Capillary forces diminish steadily with rise of temperature and in the presence of heated materials they are only important when the pores are small, so small that only insignificant amounts of water could pass through them. The argument on the basis of capillary attraction, therefore, seems opposed to the derivation of deep-seated or magmatic waters from the meteoric circulations.

ANCIENT CLIMATES. In a suggestive work on the past history of climate, issued by the Carnegie Institution, Huntington advocates the view that there is manifest a pulsatory change of climate and that the change may go forward

very rapidly, so that the population of an arid or semiarid region may be reduced in a single generation. This applies particularly to the arid parts of America. The changes there, within the last 3000 years, have been small compared to those which took place after the culmination of the last glaciation, but they are of the same nature. They mark the continuation of the geologic past into the present time. Chapters by Schuchert interpret the evidences of fossils and those deduced from the nature of the sediments as to the character of climates of earlier geologic time.

ORE-DEPOSITS. F. H. Hatch, in a review of prevalent theories as to the derivation of metallic deposits, finds that the various types of deposits may be classified after a simple scheme which has for its basis two principles—the agency concerned in the formation of the ore and the nature of the product. The agent or vehicle of concentration of ores includes: (a) Molten magmas; (b) gases and vapors above the critical temperatures; (c) deep-seated waters whether of magmatic or meteoric origin; (d) vadose waters; (e) chemical and bacterial agents in lakes and seas; (f) mechanical agents, inclusive of moving water and of wind. According to the kind of concentrate ore-bodies may be divided into: (1) Igneous differentiates; (2) cavity fillings; (3) metasomatic replacements; (4) stratified or sedimentary deposits; (5) residual deposits. By arranging the two series of features in horizontal and vertical columns, all the different types may be placed in one or another of the divisions formed by the intersections of the two columns.

The rapid expansion that has taken place in the production and use of metals has brought to the fore the question as to the adequacy of the supplies for the future. One of the important factors that enter into consideration is the possibility of conducting mining operations successfully at great depths and another is the changes to be anticipated in the nature of the ores with depth. The results thus far attained in deep mining for different metals have been briefly summarized by Kemp in a paper presented at the Toronto meeting of the International Geological Congress. At present the deepest shafts, a little over a mile, are in the copper district of Lake Superior, and experience there indicates that mining may be carried on to about twice that depth, so far as the engineering features are concerned. The record of experience, however, shows that most ores decrease in value after a moderate distance from the surface has been passed. In the case of copper sulphides, gold-bearing pyrite, and the sulphides of lead and zinc, the distribution of values is affected by changes which have taken place in the veins after their deposition. The result is a vertical zonal arrangement of the vein minerals, divided into an upper oxidized zone, a middle enriched zone, and a lower zone of sulphides. The oxidized zone lies close to the surface. The zone of enrichment depends upon variable factors but ordinarily its extent cannot be very great. Copper is the metal most subject to enrichment and in its case the enriched zone may extend for several hundred feet below the permanent water level. The zone of sulphides represents the original condition of the minerals as they were deposited in the vein by the uprising heated solutions. The extent of this zone can scarcely

be inferred, but there seems to be no reason to suppose that the ore deposition may not have taken place at greater depths than have yet been reached, although the most favorable conditions probably exist in the portion of veins above the limit of 2000 to 40,000 feet from the surface. See also **VOLCANOES**; **EARTHQUAKES**; **MINERALOGY**.

GEOPHYSICAL LABORATORY. See **CARNegie INSTITUTION**.

GEORGE II, Duke of Saxe-Meiningen and Heildburghausen, died June 25, 1914. He was born in 1826. He served with credit in the Franco-Prussian War, and after the war devoted himself largely to furthering German dramatic art. He made the Court Theatre at Meiningen the greatest centre of the drama in Germany. He was three times married, first to Princess Charlotte of Prussia, who died; then to Princess Feodora of Hohenlohe-Langenburg, who also died. Later he contracted a morganatic marriage with Helene Franz, an actress, whom he created Baroness of Heildbourg. The duchy of Saxe-Meiningen is one of the independent States of the German Empire. George II is succeeded by his eldest son, Bernhar, born in 1851. The latter married Princess Charlotte of Prussia, eldest sister of Emperor William.

GEORGETOWN UNIVERSITY. An institution for higher education, under the auspices of the Roman Catholic Church, founded in Washington, D. C., in 1789. The students enrolled in the several departments of the university in the autumn of 1914 numbered 1374. The faculty numbered 171. George E. Hamilton was appointed dean of law; Rev. Thomas I. Gasson dean of the graduate school; and Dr. Shirley W. Bowles dean of the dental department. There were no noteworthy benefactions received during the year. The library contains 124,000 volumes. The president is Rev. Alphonsus J. Donlon.

GEORGE WASHINGTON UNIVERSITY. An institution of higher learning in Washington, D. C., founded in 1821 as Columbian University. There were in all departments of the university in 1914, 1611 students. The faculty numbered 189. The only change of importance in the faculty during the year was the resignation of Dean Gregory of the law school and the appointment of Everett Fraser to take his place. The productive funds amount to about \$135,000 and the total income to about \$200,000. The library contains about 45,740 volumes. The president is Charles H. Stockton.

GEORGIA. **POPULATION.** The estimated population of the State on July 1, 1914, was 2,776,513. The population in 1910 was 2,609,121.

AGRICULTURE. The area, production, and value of the principal crops in 1913-14 are shown in the following table. The figures are from the United States Department of Agriculture, and those of 1914 are estimates only.

		<i>Acres</i>	<i>Prod. Bu.</i>	<i>Value</i>
Corn1914	4,000,000	56,000,000	\$47,600,000
1913	4,066,000	68,028,000	57,351,000
Wheat1914	140,000	1,694,000	2,270,000
1913	140,000	1,708,000	2,050,000
Oats1914	450,000	9,000,000	6,300,000
1913	420,000	9,240,000	6,283,000
Rye1914	13,000	121,000	182,000
1913	13,000	124,000	167,000
Barley1914
1913

1913	1,800	1,800,000	558,000
Cotton 1914	5,875,000	c 2,650,000	87,384,000
1913	5,818,000	2,317,000	141,722,000

a Tons. b Pounds. c Bales.

MINERAL PRODUCTION. The production of coal in the State in 1913 was 255,626 short tons, valued at \$361,319. This was the largest production since 1898. Compared with 1912, it shows an increase of 28,123 short tons in quantity and \$22,893 in value. The maximum production of coal in Georgia was 416,951 short tons, obtained in 1903. For the next eight years, except in 1907, the output steadily declined until a minimum of 165,210 tons was reached in 1911. A revival of activity is indicated in the returns for 1912 and 1913. The decrease in production from 1903 to 1911 and the increased output in 1912 and 1913 were due entirely to peculiar labor conditions and not to the state of trade and market requirements. Prior to 1904 the principal labor employed in the coal mines of Georgia consisted of convicts leased from the State government. An act of the legislature prohibiting further leasing of convicts to industrial enterprises caused the gradual withdrawal from the coal mines of this labor as contracts expired, and operators in the somewhat isolated region where the mines are located were not at once able to supply the deficiency by free labor. The influence of free labor on the efficiency record is shown by the fact that in 1907, when the principal labor was performed by convicts, it required 808 men working an average of 262 days to produce 362,401 tons, an average of 449 tons per mine for the year and of 1.71 tons for each working day. In 1913, with 500 men working 261 days, 255,626 tons were produced, the averages per man being 511 tons for the year and 1.95 tons a day.

Georgia ranks second among all the States in 1913 in the production of barytes, bauxite, fuller's earth, natural mineral paints, and paper clay, and was the only State reporting a production of asbestos. It ranks third among the Southern States and twelfth among all the States in the value of its clay products, which consist chiefly of common brick, front brick, and sewer pipe. The manufactures of clay products were valued at \$2,692,619 in 1913, compared with \$2,806,541 in 1912. The quarry products consist chiefly of granite and marble. Georgia granites have a high reputation for building purposes, and its marbles are highly prized for their structural and decorative qualities. The total value of the mineral products of Georgia in 1913 was \$6,525,792, compared with \$6,306,140 in 1912. In addition to the minerals mentioned above the State produces ocher, Portland cement, iron ore, sand, mineral waters, sand-lime brick, slate, salt, talc, and tripoli.

FINANCE. The report of the State Treasurer for the fiscal year ending Dec. 31, 1913, shows a balance at the beginning of the year of \$1,113,517, receipts for the fiscal year of \$6,907,137, and expenditures of \$7,281,030, leaving a balance in the treasury on Dec. 31, 1913, of \$739,625. The interest-bearing debt of the State on Dec. 31, 1913, was \$6,630,702. Of this amount

bonds, constituting the bonded debt of the State and amounting to \$3,679,000, will mature in 1915. Most of the bonded debt was incurred originally to aid in the building of railroads and to redeem railroad bonds indorsed by the State.

TRANSPORTATION. The total mileage of single-track road in the State on June 30, 1913, was 7295. There were in addition 98 miles of double track and 1967 miles of track and sidings. The roads having the longest mileage are the Central of Georgia, 1330; the Southern Railway, 909; the Seaboard Air Line, 744; and the Atlantic Coast Line, 707.

EDUCATION. The total number of persons of school age in the State in 1913 was 795,484. The total average enrollment in that year was 590,808, and the average daily attendance was 380,750. The total number of schools was 8268, with 15,209 teachers. There were 6898 school-houses. Of the total number of schools, 4998 were for white pupils and 3186 for colored. In schools for white children the teachers numbered 8743 and for colored 4031. The total enrollment in the white schools was 360,554 and in schools for colored 230,254. The average monthly salary paid to white male teachers in the county systems was \$69.96 and to female teachers in these systems \$47.10. The average monthly salary paid to colored male teachers in the county systems was \$28.40 and to colored female teachers \$22.11. In the special systems the average monthly salary paid to white male teachers was \$140 and to female white teachers \$58.92. In these systems there were paid to colored male teachers \$56.50, and to colored female teachers \$30. The total funds raised for common schools in 1913 amounted to \$5,584,333.

POLITICS AND GOVERNMENT. The State Legislature met in 1914 and the measures passed were almost entirely concerned with matters of local interest. On February 25 Governor Slaton appointed William S. West to take the seat, made vacant in the United States Senate by the death of Senator A. O. Bacon, until the election held to choose Senator Bacon's successor. The latter's death and the expiration of the term of Senator Hoke Smith on March 4, 1915, made it necessary to elect two Senators in 1914. In the primary elections for nomination, Senator Smith was renominated, defeating former Governor Brown; and Thomas W. Hardwick, a Representative in Congress, was nominated for the short term. Mr. Hardwick was opposed for the nomination by former Governor Slaton and several other candidates. In the election held on November 3 Senator Smith and Mr. Hardwick were elected by large majorities. In the same election Nathaniel E. Harris was elected Governor, with practically no opposition.

National attention, on account of the character of the matter involved, was directed to the inquiry of misconduct and mental unsoundness on the part of Judge Emory Speer of the southern district of the State, which was begun in January by a committee of inquiry, appointed by the National House of Representatives. Much evidence was given to show loose methods on the part of Judge Speer in the conduct of his court and it was charged on the bench he had been high-handed, domineering, dictatorial, and untrammelled. Judge Speer filed a reply to these charges on February 22. He denied them in general and in detail. The House committee

presented its report on June 23. In this Judge Speer was severely arraigned for misusing his high office, but he was spared an impeachment trial because the committee believed that there was not sufficient evidence of wrong-doing to convict him. The committee requested the House to drop the charges and this was done. Charges made against the administration of the Federal prison in Atlanta resulted in an investigation into the administration of that institution during the year. This resulted in somewhat improved conditions.

* STATE GOVERNMENT UNTIL JULY 1, 1915. Governor, John M. Slaton; Secretary of State, Philip Cook; Treasurer, Wm. J. Speer; Comptroller and ex-officio Commissioner of Insurance, W. A. Wright; Attorney-General, Warren Grice; Adjutant-General, J. Van Holt Nash; Superintendent of Education, M. L. Brittain; Commissioner of Agriculture, J. D. Price—all Democrats.

JUDICIARY. Supreme Court: Chief Justice, Wm. H. Fish; Beverly D. Evans, Presiding Justice; Associate Justices, J. H. Lumpkin, M. W. Beck, Samuel C. Atkinson and H. W. Hill; Clerk, Z. D. Harrison—all Democrats.

STATE LEGISLATURE, 1915.

	<i>Senate</i>	<i>House</i>	<i>Joint Ballot</i>
Democrats	43	183	226
Republicans	1	1	2
Democratic majority.	42	182	224

The State representatives in Congress will be found in the article UNITED STATES, section *Congress*.

GEORGIA, UNIVERSITY OF. A university for higher education founded at Athens, Ga., in 1785. There were in all departments of the university in 1914, 632 students. The faculty numbered 68. The productive funds amounted to about \$400,000. The university is wholly supported by appropriations from the State Legislature. In the library there are about 50,000 volumes. The president is D. C. Barrow, LL.D.

GERAGHTY, MARTIN JOHN. An American Roman Catholic clergyman, died Sept. 28, 1914. He was born in Carthage, N. Y., in 1867, and received a classical and scientific education at Villanova College, graduating in 1885. In the same year he entered the Augustinian Novitiate. He was ordained a priest in 1890, and for several years after served as pastor in Chestnut Hill, Philadelphia. He was then chosen Master of Novices and Sub-Prior of the Monastery at Villanova, the mother house of the Augustinian Order in America. In 1902 he was appointed Prior Provincial of the order. He was founder of St. Rita Hall at Villanova, and from 1909 until his death was Commissary General over the Italian Augustinian Fathers in Philadelphia.

GERMAN EAST AFRICA. A protectorate of Germany on the Indian Ocean between the East Africa Protectorate and Portuguese East Africa. Estimated area, 995,000 square kilometers (384,170 square miles). It was acquired by the Germans in 1885. The native population is estimated at 7,661,000, and the white population numbered Jan. 1, 1913, 5336.

Many minerals, including gold, iron, copper, lead, coal, and precious stones, are found in the protectorate, and the forests contain many val-

* New governor takes office July 1, 1915.

uable species of timber. The natives cultivate the soil to some extent and raise corn, pulse, and bananas for their own use; they also practice grazing. Products of the German plantations include coffee, cacao, vanilla, tobacco, rubber, sugar, cotton, coconuts, and cardamoms. Imports and exports in 1911 were valued at 45,-892,000 and 22,438,000 marks respectively; in 1912, 50,309,000 and 31,418,000; in 1913, 53,400,000 and 35,500,000. Imports from and exports to Germany in 1912 amounted to 25,819,000 and 17,827,000 marks. The rubber export in 1912 was valued at 8,426,000 marks; sisal, 7,359,000; hides and skins, 4,067,000. Vessels entered in the 1912 trade, 1034, of 1,913,743 tons. The Usambara Railway from Tanga to Muhesa, a distance of 218 miles, is in operation, and the Central Railway from Dar-es-Salaam to Ujiji was completed in February, 1914; a total length of 743 miles. The Cape to Cairo Railway during 1914 naturally was quiescent. As the line as projected passed through parts of German territory, this blocked the construction, and the English interests were hoping that one result of the war would be to eliminate this obstruction. The budget for 1913-14 balanced at 54,755,315 marks. The administrative headquarters is Dar-es-Salaam. The Governor in 1914 was Dr. Schnee, appointed July, 1912.

In the course of the WAR OF THE NATIONS (q.v.), a British steamer shelled the German town of Langenburg, on Lake Nyasa, and landed a force to take possession of the place, September 1. Late in November the British government was compelled to admit that a British expedition sent to attack German East Africa had been defeated on November 4 with a loss of 795 killed and wounded. At the end of December the British warships *Goliath* and *Fow* bombarded the important coast town and railway terminal of Dar-es-Salaam.

GERMAN EVANGELICAL SYNOD OF NORTH AMERICA. There were in this denomination in 1914, 261,488 communicants, 1345 churches, and 1051 ministers. The denomination is strongest in the Central and North Central States, although nearly all the States of the Union have communicants. The church property is valued at about \$1,400,000, and each year over \$1,000,000 is spent for the maintenance of churches. The denomination maintains missionaries in India, where there are about 4000 adherents. Papers are published in St. Louis, and a college is maintained at Elmhurst, Ill., with a theological seminary at St. Louis. There are charitable institutions for orphans, superannuated ministers, and the widows and orphans of deceased ministers.

GERMANIC PHILOLOGY. See PHILOLOGY, MODERN.

GERMAN LITERATURE. Looking back upon the spirit of German literature during the year 1913 one is tempted to consider it as something like a historical prelude to the war which broke out in the summer of 1914. For the centenary of the Wars of Liberation had struck a note of patriotism which found ready response in drama, fiction, and poetry, and exerted its influence far into the following year. Dwelling upon recollections of their forefathers' struggles with the Napoleonic peril, German poets became loquacious and there was no end of books directly or indirectly inspired by the historical events which a hundred years ago reconstructed

the map of Europe. Patriotism is infectious and largely a matter of crowd psychology. That the literature called forth by this sentiment with few exceptions lacked genuine artistic quality did not limit its emotional appeal. There can be little doubt that it served to prepare the mood of the people when the summer of 1914 fanned this reminiscent patriotism into a living and timely force and brought it to a lyrical climax. For to burst into lyric verse seems to the poetic temperament of the German curiously dependent upon some solemn or festive occasion. To this high tide of national pride and patriotic zeal is due the flood of lyrical pathos in the periodical literature of the time. That drama and fiction, which need a certain amount of deliberation and perspective, will before long reflect the same spirit, there is no doubt. In the meanwhile the quantity of literary production has perceptibly diminished; nor can it be denied that the output for the whole year has been even more lacking in works likely to stand the test of time than that of its recent predecessors. In no department of literature does any one supreme effort promise to occupy a permanent place.

DRAMA. The most remarkable work that has come from German dramatists during this year is Carl Hauptmann's *Krieg—ein Tedeum*. It is a powerful poetic drama which undoubtedly owed its inception to memories of 1813, but the action is removed from any definite time and place and in the light of the war which broke out shortly after its publication, it partakes of the character of a prophecy full of subtle symbolism. It conjures before the reader a panorama of diplomatic games, domestic tragedies, the social upheaval, and the gruesome aftermath of war. With the exception of this work which the lamented Bertha von Suttner acclaimed shortly before her death, the dramatic output of the year has been rather insignificant. Hermann Sudermann's *Lobgesänge des Claudian* has had that measure of success which German audiences never deny an author of his reputation. Ludwig Fulda's *Rückkehr zur Natur* owes its reception to the same sentiment and to its light calibre. Alexander von Gleichen-Russwurm, a direct descendant of Schiller, who has for many years been identified with essays and treatises on æsthetic problems and social customs, made his entrance in the world of drama with a three-act play entitled *Die Tragödie der Schönheit*. Hermann Bahr, the prolific and clever Austrian, who seems to be the only German playwright popular with American audiences, has scored a success with *Das Phantom*. His compatriot, Karl Schönherr, has so far been unable to repeat the profound impression made a few seasons ago by his powerful drama *Glaube und Heimat*, although his new work, *Die Trenkwalder*, is characterized by the same wholesome and virile spirit. Ernst Hardt who shared with Schönherr the Schiller prize of 1908 continues to work in the neo-romantic manner, his new work being *Schirin und Gertraude*. Georg Hirschfeld is one of the most pathetic figures in the ranks of Young Germany. Hailed in the nineties as a possible rival of Gerhart Hauptmann, he has met with failure after failure and periodically drops out of sight, only to return and court once more a theatrical success. His latest efforts are a three-act comedy, *Rösisches Geist* and the drama *Ueberwinde*. Frank Wedekind, the most

puzzling personality among Germany's dramatists, has succeeded in his *Simson* to give the well-worn story of Samson and Delilah a new interpretation. Hans Müller, a Viennese writer who has not a little in common with Wedekind, though he may lack his seriousness, has attracted attention by a comedy in three acts: *Der reizende Adrian*. Hermann Anders Krüger, novelist and critic, has added to the year's dramatic output a three-act comedy: *Die Pelzmütze*. The character of the famous German Ananias, Baron Münchhausen, has been employed by Friedrich Lienhard as the central figure of his comedy of that name. Lienhard has also written: *Odysseus auf Ithaka*. That it is impossible for German authors to represent American life in drama or fiction without a touch of caricature is proved anew by Otto Soyka's otherwise clever comedy *Geldzauber*, which exploits the fiction so popular in Germany, that money is almighty in America. Ludwig Thoma's realistic plays of peasant or middle-class life in Germany are irresistible in their appeal. His new comedy, *Die Sippe*, treats a domestic problem of frequent occurrence more seriously than is his custom and in a new social milieu. Roda-Roda and Gustav Meyrink have collaborated on a two-act play, *Die Uhr*. One-act plays are very popular; they seem to be the fit medium for clever commentators of society like Oskar H. Schmitz who publishes five of these playlets under the title *Don Juan und die Kurtisane*. Still there is no lack of plays that seem to follow the classical tradition. Not a few of them are historical, among them Herbert Alberti's *Agrippina*, Otto Manz's *Die Berufung des Tiberius*, Fritz von Unruh's *Prinz Louis Ferdinand von Preussen* and an ambitious *Kaiser Otto der Dritte* by Alberta von Puttkammer, an unusually gifted woman whose literary reputation so far had rested upon her admirable *Balladen*. Paul Ernst's *Manfred* and *Beatrice*, Hanna Rademacher's *Golo* and *Genovefa*, Emil August Glogau's *Hagar*, and Albert Geiger's dramatic legend *Sun* also belong to this group. What a great part the moving-picture theatre plays in Germany is proved by the appearance of a collection of plays, *Das Kinobuch*, which contains contributions by Elsa Lasker-Schüler, Elsa Asenijeff, and others, and by the number of books in which the "Kino" is made the subject of æsthetic, critical, and even sociological comment.

FICTION. The fiction of 1914 is even more lacking in works that have an element of greatness than the drama of the year. But the production is enormous and there is such an abundance of talent, that the proportion of works challenging attention by some individual interesting feature is remarkable. Not a few stories of the year owe their inception to the keynote of 1813. Walter Bloem, who is developing into an appallingly prolific writer, has published a new historical novel, *1813-14—Geschichte eines jungen Freiheitskämpfers*. Franz Adam Beyerlein, the author of *Jena oder Sedan?* and *Der Zapfenstreich* (Taps), has contributed to the literature of the Wars of Liberation *Das Jahr des Erwachens*, and August Sperl, *Burschen heraus*. Other novels with a historical background are *Die trennende Brücke*, a Viennese story by Julius von Ludassy; *Wenn Götter lieben* by the indefatigable Richard Voss; and *Mutter Venedig* by Wilhelm Fischer-Graz, whose work has al-

ways an individual charm. Adam Müller-Guttenbrunn, long identified with the literature of the Teuton-Slav conflict which disturbed the peace of Austria and recently of all Europe, has written a book of fiction with the suggestive title *Deutscher Kampf*. Walter von Molo, who has set out to treat the life of Schiller in a series of novels, has written a new volume entitled *Die Freiheit*. The novel which takes its cue from biography and traces the whole development of a human soul seems more and more to engage the attention of the more serious authors. Enrica Händel-Mazetti, who some years ago scored a great success with her story of the Thirty Years' War, *Die arme Margret*, has published the second volume of her novel of Styrian life: *Stephana Schwoertner*. A name challenging general attention, Max Nordau, appears on the title-page of a novel called *Doktor Kohn—ein Lebenskampf*. Elisabeth von Heyking, who some years ago had such an astonishing success with her *Letters that never Reached Him*, continues to exploit her experiences as a diplomat's wife in her fiction; her latest work is a Chinese story, *Tschun*. As an interpreter of present-day problems Max Ludwig has become a force to be reckoned with in German fiction. In his last book, *Der Sieger*, he forecasts a conflict which has some analogies with the cataclysm which has since followed. In the psychology of an effete nobility E. von Keyserling is unparalleled, and his style is of such a rare quality that his new story, *Abendliche Häuser*, is a little masterpiece. Compared with his novels those of Georg von der Gabelentz and Georg von Ompteda, treating the same social class, seem to be written from the outside. But a new writer, Wilhelm Speyer, sees that world through the eyes of a critic of human society, and his novel, *Das fürstliche Haus Heerfurth*, deserves a place by itself. New novels by Otto Gysae, *Die Leidenden*; Alexander Castell, *Büsser der Leidenschaft*; Adolf Köster, *Die bange Nacht*; Hans Heinrich Ehrler, *Die Reise ins Pfarrhaus*; and A. Von Vestenhof, *Der Mann mit den drei Augen*, give evidence of their authors' concern with psychological and spiritual conflicts, the last story excepted, which in its grotesque fancy suggests the influence of Poe. Of the group once known as Young Germany, not a few members have published new works: Hermann Hesse, *Rosshalde*; Georg Hirschfeld, *Die Belowsche Ecke* and *Die deutsche Prinzessin*; Hans Land, *Alfred von Ingelsheims Lebensdrama*; Felix Holländer, *Frau Ellin Rote*; and Paul Scheerbart, the master of whimsical moods and strange fancies, calls his story: *Das graue Tuch und zehn Prozent Weiss-ein Damenroman*. Wilhelm Hegeler, who is of the same generation, but never shared its idiosyncrasies, has given a new proof of his ripe and well-balanced art in *Die Leidenschaft des Hofrat Horn*. René Schickel, the Alsatian, has written *Benkal, der Frauenröster*; and Paul Leppin, the Austrian poet, appears as author of what he calls a ghost story of Prague, *Severins Gang in die Finsterniss*. Among the numerous novels by women authors the year has seen the publication of two novels by the author of *The Department Store*, Margarete Böhme, *Anna Nissens Traum* and *Sarah von Lindholm*; Helene Mühlau's *Die zweite Generation*; Emmi Elert's *Heimat Landstrasse*; and others by Olga Wohlbrück, Charlotte Niese, Maria Janitzschek, Hans von Kahlenberg, which

is the pseudonym of a prolific writer of rather questionable stories, and others.

The short story is gaining in favor. Unusually great is the number of *Novellen* and *Erzählungen* coming from the Austrian book market; it seems to indicate that this form of fiction appeals particularly strongly to the temperament of the Austrian. The list contains Marie Eugenie delle Grazie's new volume, *Das Buch des Lebens*; Gisela von Berger's *Königskind Seele*; Adam Müller-Guttenbrunn's *Sommerbuch*; Wilhelm Fischer-Graz's *Alltagszauber*; Arthur Schnitzler's *Die griechische Tänzerin*; Arthur Holitscher's *Geschichten zweier Welten*; Emil Ertl's *Drei Novellen*; Felix Salten's *Der Schrei der Liebe*; Richard Schaukal's *Zettelkasten eines Zeitgenossen*; and Rudolf Greinz's humorous tales, *Die Schellenkappe*. Two Swiss writers have published new books of stories, Alfred Hugenberg, *Bauernland*, and Meinrad Lienert, *Bergdorfgeschichten*. Bernd Isemann, an Alsatian who made a promising début a few years ago, has published two stories, *Maria im Tempel*, and *Der Musikantenstreich*. Heinrich Spiero, the poet and critic, also appears as author of two *Novellen*, *Adalbert Kalweit*, and *Das Manuskript*. Ludwig Thoma's *Kalbarsleute* is in his usual humorous vein. A posthumous book by Anton von Perfall is entitled *Meine letzten Waidmannsfreuden*, and will appeal to the lover of hunting. Heinrich Lhotzky's *Geschichten aus dem Weiherthal* derive special interest because the title adds that they were told after Japanese pictures. That Alfons Paquet's *Erzählungen an Bord* have touches of exotic flavor can be expected from an author who has traveled so widely. A book by Anna Croissant-Rust, the Munich writer, bears the title *Der Tod*, and the seventeen sketches which it contains have been illustrated by as many drawings by Willi Geiger. Carl Hauptmann's *Schicksale* is one of the most noteworthy volumes of the year, dealing with the curious characters which the author delineates with so much understanding and sympathy. There have also been books of short stories by Wilhelm Wolters and Timm Kröger, and a volume of clever sketches by Else Lasker-Schüler.

POETRY. The lyrical production of the year has been great, but devoid of any new, striking physiognomies. What was once a group of ardent young souls, the young generation of the nineties, singing of new ideals of life and art, now in its maturity still sings, but the tunes are very much on the order of that view of life and art which twenty years ago they had set out to revise. The fiftieth birthday of Karl Henckell was duly solemnized by the publication of a little book, *Hundert Gedichte*, selected by himself. Max Dauthendey, too, has a volume of selected verse to his credit. Gustav Falke's new verse, *Anna*, gives little evidence of growth. Christian Morgenstern's last verse was entitled *Wir fanden einen Pfad*. Elsa Asenijeff, who belongs to the same generation, has written a novel in lyrics, entitled *Hohelied an den Ungenannten*. Poets not immediately connected with that group of writers are Georg Busse, whose new poems are published under the title *Zwischen Himmel und Hölle*; Stefan George, whose book, *Der Stern des Bundes*, reflects the abstract beauty and dignity which seem a part of his individuality; Hans Bethge, who in *Die indische Harfe* offers echoes of Hindoo song; Rudolf Presber, whose book,

Zwischen zwei Seelen, is the expression of a sincere, though not very striking personality; Gustav Schüller who presents two books of verse, one called *Balladen und Bilder*; and Benno Geiger whose collected poems have been published. A posthumous volume of verse by Gerard Ouckama Knoop is a pathetic reminder of a name that one misses with regret among current publications. The Swiss critic and poet, Adolf Frey, and the Alsatian René Schickelé, have published volumes of verse. Anton Wildgans, an Austrian poet, strikes a timely war note in the volume entitled *Vae Victis*. One of the recent newcomers of promise, Paul Zech, calls his new book of verse *Die eiserne Brücke*. Some new arrivals in the lyrical field are Marte Sorge with a book of lyrics on woman, *Frauenlieder*; Gottfried Kölwel with a volume of *Gesänge gegen den Tod*; and Paul Boldt, whose *Junge Pferde! Junge Pferde!* is a title that contrasts strangely with the conventional sonnet prevailing within the pages of the book. It is easy, however, to associate the erratic personality of Erich Mühsam with a volume of verse called *Wüste, Krater, Wolken*. The latest lyrical publications of the year have taken the form of paper covered booklets in which the verse called forth by the war is collected and sent to the men at the front; *Der heilige Krieg* is the title of one of those collections, and it is painful for the neutral onlooker to find among the singers of the most strident war cries, the names of many comparatively young radicals who a decade or two ago had little or no sympathy for militarism and its manifestations.

BIOGRAPHY, LETTERS, AND MEMOIRS. One of the most important biographical works published during the year is Dr. Ludwig Schemann's *Gobineau* and a volume of supplementary notes on the life and work of the great French scholar. Richard Wagner, too, continues to be the subject of biographical research, and the latest volume which has been added to Wagner literature is Hans Belart's *Richard Wagner's Beziehungen zu François und Maria Wille*. Another valuable contribution to biography is Elizabeth Förster-Nietzsche's *Der einsame Nietzsche*. A biography of Lenau has been written by Anton X. Schurz; of Theodor Körner by Walter Jacobi; of the Tyrolean poet, Karl Domanig, by Anton Dorrer; of Theodor Herzl, the Zionist, by Adolf Friedmann; of Johanna Schopenhauer by Laura Frost; of Wilhelm Jensen by Dr. Otto Fraass; of Ernst von Wildenbruch by Berthold Litzmann; and the Low German poet, John Brinckmann, is the subject of two biographies, one by Wilhelm Schmidt, the other by Otto Waltzin. A place by itself belongs to Max Wundt's *Platons Leben und Werk*. Other biographical works are Dr. Richard Fenger's *Kleist's Geheimnisse*; Heinrich Conrad's *Napoleons Leben auf St. Helena*; Hermann von Egloffstein's *Carl August während des Krieges von 1813*; Leopold Matzon's *Der junge Rückert*; Johannes Meissner's *Jung Shakespeare*; Adolf Vögtlin's volume of Gottfried Keller anecdotes; and August Steiger's book on Keller's mother; Wilhelm Hertz's biography of Bernhard Crespel, the friend of Goethe's youth, etc.

Musical biography received important additions in R. Hohenemser's *Luigi Cherubini*, and in Albert Leitzmann's two books on Mozart and Beethoven in the light of their contemporaries.

Autobiographical volumes of varied interest are J. F. Castelli, *Memoiren meines Lebens*; Rosa Sucher's *Aus meinem Leben*; Georg Forster's *Tagebücher*, and the charming volume of recollections of his childhood by the Swiss poet, Carl Spitteler, *Meine frühesten Erlebnisse*. Many volumes of letters have been published during the year: two editions of those of Hebbel, and two of Heine, a selection of the letters of Dorothea and Caroline Schlegel, and a volume of the letters of Maria Theresia. An interesting book by Anton Bettelheim is entitled, *Biographenwege*.

HISTORY. Great interest is shown in Ricarda Huch's history of the Thirty Years' War, of which the third volume embraces the period 1635-50. A work which suggests comparisons between Germany then and now is, 1848—*der Vorkampf deutscher Einheit und Freiheit*, compiled by Dr. Tim Klein from documents. Eberhard Bücher has written *Die französische Revolution*; and H. P. Gerken offers a contribution to Napoleonic literature, *Der Sturz Napoleons*. Dr. Hermann Oncken has published two volumes of *Historisch-politische Aufsätze*.

CRITICISM, ESSAYS, ESTHETIC AND PHILOSOPHICAL. To survey the vast amount of books written by German authors on other authors, living or dead, native or foreign, and to separate the wheat from the chaff, is a difficult task. The year has added some more volumes of critical research and interpretative comment to the already voluminous Goethe and Schiller literature: Theobald Ziegler's *Goethes Welt- und Lebensanschauung*; Emil Schaeffer's *Goethes äusserer Erscheinung*; Dr. Carl Horn's *Goethe als Energetiker*; Fritz Berresheim's book on Schiller as an editor; and Franz Schnaass's *Schiller als Dramatiker*. Shakespeare rivals the two German classicists in the attention bestowed upon him, as is proved by Prof. Gustav Wolf's *Der Fall Hamlet*; Jacob Overmann's *William Shakspeare und Robert Southwell*; Friedrich Gundolf's *Shakspeare und der deutsche Geist*; Johann E. Schmidt's *Shakespeares Dramen und sein Schauspielberuf*; and Meinrad Haberl's *Die Entstehung des optischen und akustischen Sinnes bei Shakspeare*. Dr. Adolf Köster's *Der junge Kant im Kampfe um die Geschichte*; and Friedrich Gogarten's *Fichte als religiöser Denker* are full of suggestion. Dr. Adolf Kohut has compiled a volume of selections entitled *Christoph Martin Wieland als Dichter und Weltweiser*. The romantic school is the subject of books by Julius Bab and Dr. Rudolf Haym. Hebbel literature has been enriched by at least one volume: Dr. Karl Herke's *Hebbels Theorie und Kritik poetischer Muster*. Nietzsche enters into the speculations of three authors: Benedict Lachmann's *Protagoras, Nietzsche, Stirner*; Friedrich Lienhard's *Parsifal und Zarathustra*; and Otto Ernst's *Nietzsche der falsche Prophet*. Among the many books devoted to the drama and allied subjects are Otto Brahm's and Alfred von Berger's posthumous volumes of critical studies; Monty Jacobs's *Deutsche Schauspielkunst*; Ernst L. Stahl's work on the English stage of the nineteenth century; Friedrich Kausler's *Schauspielernotizen*; Ludwig Barnay's *Ueber Theater und Anderes*, etc. Among the books of essays Franz Blei's *Landfahrer und Abenteurer*; Emil Ludwig's *Der Künstler*, Fritz Mauthner's *Gespräche im Himmel*, and Kurt Martens's *Geschmack und Bildung* are the most noteworthy. There has been the usual abundance of

books devoted to critical and uncritical appreciation of the younger German authors, among them Gerhart Hauptmann, Richard Dehmel, Arthur Schnitzler, Ernst Hardt, Ricarda Huch, Cäsar Flaischlen, and others. There has also come a volume from Dr. Rudolf Eucken, *Zur Sammlung der Geister*; and one by Walter Rathenau, *Zur Mechanik des Geistes*.

LITERATURE AND LANGUAGE. From literary historians have come some books of value to the student: Richard M. Meyer's *Die Weltliteratur in 20. Jahrhundert*; Dr. Julius Petersen's *Literaturgeschichte als Wissenschaft*; Karl Vossler's *Die italienische Literatur der Gegenwart*; Dr. Wilhelm Friedmann's, *Die französische Literatur im 20. Jahrhundert*; and Hermann Anders Krüger's *Deutsches Literatur-Lexikon*. Interesting anthologies are *Das Bayernbuch* and *Der deutsche Psalter*. A valuable book of reference is Dr. Friedrich Kluge's *Etymologisches Wörterbuch der deutschen Sprache*.

MISCELLANEOUS WRITINGS. An interesting undertaking by a German publishing house is entitled *Die schönsten Märchen der Weltliteratur*, and has so far brought out volumes of Low German, Norse, Russian, and Greek tales. Among the numerous books of travel are Laurids Bruun's *Vom Bosphorus bis zu van Zanten's Insel*; Richard A. Bermann's *Irland*; Albert H. Rausch's *Südliche Reise*; Egon von Kapherr's *Drei Jahre in Sibirien als Forscher und Jäger*; and an attractive annual *Deutsch-Nordisches Jahrbuch 1914* devoted to Scandinavia. Of intimate historical interest is Emil Hofmann's *Wiener Wahrzeichen*. Dr. A. P. Clasen's *Der Salutismus* is a historical and sociological survey of the work of the Salvation Army. Eberhard Zschimmer's attempt at interpreting our technical age in *Zur Philosophie der Technik* is commendable. A noteworthy contribution to feminist literature is Grete Meisel-Hess's *Betrachtungen zur Frauenfrage*. The problem of physical culture and modern dancing has been exhaustively treated by Dr. Fritz Winther in *Körperbildung als Kunst und Pflicht*.

NEW EDITIONS. There has been no decrease in new editions of Goethe and Schiller. Other poets so distinguished are Heinrich von Kleist, Hölderlin, Grillparzer, Hoffmann von Fallersleben, and Wilhelm Raabe.

NECROLOGY. The dead of the year include Heinrich Eduard Brockhaus of the publishing firm in Leipzig; Rudolf Genée, dramatist and critic; Heinrich Zeise and Christian Morgenstern, lyric poets; Dr. Julius Rodenberg, the veteran editor of *Die Rundschau*; Dr. Karl Frenzel, the novelist; Otto Henne am Rhyn, the historian; Fritz Marti, the Swiss writer; Dr. Otto Harnack, Paul Heyse, and Bertha von Suttner.

GERMAN NEW GUINEA. A German protectorate, including Kaiser-Wilhelmsland and the Bismarck Archipelago. Estimated area, 240,000 square kilometers (92,664 square miles). The native population, with dependencies, is estimated at 602,000; whites in German New Guinea, Jan. 1, 1913, numbered 968, and in the dependencies, 459. The Germans acquired the protectorate in 1899. The capital is Rabaul. The dependencies are the Caroline, Palau, Mariana, and Marshall groups of islands. Imports and exports of German New Guinea in 1911, 5,299,000 and 4,109,000 marks respectively; in 1912, 5,872,000 and 5,041,000. Imports and exports of the East Carolines and the Marshall Islands in 1911,

1,729,000 and 6,271,000 marks; in 1912, 1,963,000 and 5,164,000. Imports and exports of the West Carolines, together with the Palau and Mariana groups, in 1911, 987,000 and 1,646,000 marks; in 1912, 1,372,000 and 1,882,000. Vessels entered in the 1911 trade, 717, of 468,000 tons. The budget for 1913-14 balanced at 3,413,997 marks. Estimated revenue and expenditure 1913, 3,410,000 marks, including 1,650,000 marks imperial subvention. Dr. Hahl was Governor in 1914. On Sept. 11, 1914, an expeditionary force of British Australians captured the town of Herbertshöhe, the seat of government for Kaiser-Wilhelmsland, the Bismarck Archipelago, and the German Solomon Islands, killing a score or more Germans, and occupying the colony for the British Empire. On September 25 the Australians also took possession of Friedrich-Wilhelms-hafen. Consult the article on the WAR OF THE NATIONS.

GERMAN REFORMED CHURCH. See REFORMED CHURCH IN THE UNITED STATES.

GERMAN SAMOA. A protectorate of Germany in the southern Pacific, composed of the islands of Savii (652.9 square miles), Upolu (335.5), Manono (3.3), and Apolim (1.8)—a total of 993.5 square miles. The estimated native population, 38,000; whites, Jan. 1, 1913, 544. The staple product is copra. Imports and exports in 1911, 4,066,000 and 4,390,000 marks respectively; in 1912, 4,994,000 and 5,045,000. The copra export in 1911 was valued at 3,583,000 marks, and in 1912 at 4,070,000; cacao, 770,000 and 840,000. There entered in the 1912 trade, 65 vessels, of 74,430 tons, exclusive of coasters and warships. The budget balanced (1913-14) at 1,132,804 marks. The administrative headquarters is Apia (Upolu). Dr. Schultz was Governor in 1914. An expeditionary force from New Zealand took possession of German Samoa on August 29, occupying the colony in the name of Great Britain, and sending the German Governor and officials to the Fiji Islands. Consult the article on the WAR OF THE NATIONS.

GERMAN SOUTHWEST AFRICA. A protectorate of Germany on the Atlantic, lying between Angola and the Cape Province (excepting Walfish Bay, which belongs to the Cape Province). Estimated area, 835,100 square kilometers (322,432 square miles). The native population is estimated at 84,000, and the white inhabitants numbered, Jan. 1, 1913, 14,830. The Germans acquired the protectorate in 1884, but have always met with vigorous resistance from the natives, especially the Hottentots and Damaras. The most important industry is stock raising, the number of animals in 1913 including 205,643 cattle, 17,171 Persian sheep, 53,691 wool sheep, 472,585 mutton sheep, 11,191 karakul, 485,481 goats, 31,503 angora goats, 15,916 horses, 13,618 asses and mules, 7772 swine, 709 camels, and 1507 ostriches. The output of the diamond mines in 1910-11 totaled 814,322 carats; 1911-12, 766,465 carats. Imports and exports in 1911 were valued at 45,302,000 and 28,573,000 marks respectively; in 1912, 32,499,000 and 39,035,000. Diamond export in 1911 and 1912, 23,034,000 and 30,414,000 marks respectively; copper, 3,754,000 and 6,523,000; lead, 346,000 and 228,000; skins, 246,000 and 298,000; ostrich plumes, 80,000 and 97,000; wool, 74,000 and 150,000; sealskins, 44,000 and 42,000. Imports from and exports to Germany in 1912 were valued at 26,442,000 and 32,454,000 marks, respectively. Vessels entered

in the 1912 trade, 430, of 1,417,230 tons. There are railway lines from Swakopmund to Windhuk (237 miles), from Swakopmund to Tsumeb (359 miles), and from Otavi to Grootfontein. The line from Lüderitzbucht to Keetmanshoop was completed in July, 1908. The State has bought the Otavi and Otavi-Grootfontein lines, leasing the latter to the Southwest Africa Company for 30 years. The total length of all railways in operation is officially given at 2104 kilometers at the end of 1913. The principal line of railway in German Southwest Africa was of 3-foot, 6-inch gauge, running from Swakopmund inland via Karibib to a point about 180 miles from the coast, where it turns southward and goes via Windhuk and Keetmanshoop to Seeheim, where it bends coastward, terminating at Lüderitzbucht. From Seeheim there is a branch southward to Warmbad. The total length of the line from Swakopmund to Lüderitzbucht was 790 miles, and of the branch line from Seeheim to Warmbad, 139 miles. There is also a narrow gauge (2-foot) line from Swakopmund to Tsumeb, 370 miles, with a branch from Otavi to Grootfontein. The various distances are as follows: Lüderitzbucht to Warmbad, 338 miles; Lüderitzbucht to Windhuk, 545 miles; Swakopmund to Karibib, 125 miles; Swakopmund to Windhuk, 244 miles, and Warmbad to Windhuk, 484 miles. At the end of the year much interest was being manifested in the effect of the great European War on the railway map of Africa, as Germany was spending vast sums on the development of railway schemes in her African colonies, and had constructed a number of lines of commercial, military, and strategic importance. Up to 1914 none of these had been productive, and, while future profits could reasonably be expected, yet the outcome, in the event of their being taken by other countries, was a matter of considerable speculation, inasmuch as the German colonies were sandwiched in between those of Great Britain, France, Portugal, and Italy. The budget for 1913-14 balanced at 54,141,672 marks, including 14,626,840 marks imperial subvention. The estimate for 1913-14 was 54,140,000 marks, including 48,260,000 marks imperial subvention. Windhuk is the administrative headquarters. Dr. Seitz was Governor in 1914. Lüderitz Bay, in the southern part of German Southwest Africa, was occupied on September 19 by forces from the neighboring British colony of South Africa. Consult the article on the WAR OF THE NATIONS.

GERMANY. The German Empire, a constitutional monarchy, consists of twenty-five federated States and an Imperial Territory (Reichsland). The capital is Berlin.

AREA AND POPULATION. The area of the empire is officially stated at 540,857.6 square kilometers, equivalent to 208,825.2 square miles. It is of interest to note that this area is only slightly greater than that of France, 207,129 square miles, and is about the same as the combined areas of Maine, New Hampshire, Vermont, Massachusetts, Connecticut, New York, Pennsylvania, New Jersey, and Kentucky, 208,428 square miles. The area in square miles, and the *de facto* population according to the census of Dec. 1, 1900, and the census of Dec. 1, 1910, are shown by States in the following table (*k* kingdom, *g* grand duchy, *d* duchy, *p* principality, *fc* free city, *r* Reichsland); under Prussia are shown the constituent provinces and territory of Hohenzol-

lern, and under Bavaria are shown Bavaria proper (that is, the eastern part), and the detached Palatinate (west of the Rhine):

	Sq. m.	Pop. 1900	Pop. 1910
Prussia (<i>k</i>)	134,663.9	84,472,509	40,165,219
East Prussia	14,286.5	1,996,626	2,064,175
West Prussia	9,866.7	1,563,658	1,708,471

Alsace-Lorraine (<i>r</i>)	5,606.9	1,719,470	1,874,014
Total	208,825.2	56,367,178	64,925,993

The growth of population on the present territory of the empire is stated as follows: in 1816, 24,833,000; in 1825, 28,113,000; in 1835, 30,938,000; in 1840, 32,787,000; in 1850, 35,397,000; in 1860, 37,747,000; in 1864, 39,392,000; in 1871, 41,058,792; in 1880, 45,234,061; in 1890, 49,428,470; in 1900, 56,367,178; in 1905, 60,641,489; in 1910, 64,925,993. The increase from 1871 to 1880 amounted to about 10.8 per cent; from 1880 to 1890, 8.9; from 1890 to 1900, 13.1; from 1900 to 1910, 14.1; from 1871 to 1910, 58.1. The average density per square mile in 1871 was about 197, and in 1910 about 311.

The estimated population of the empire, and of the Zollgebiet respectively, on June 30, 1912, was 66,146,000 and 66,391,000; on June 30, 1913, 66,981,000 and 67,228,000; on June 30, 1914, 67,812,000 and 68,061,000.

The 1910 census returned 32,040,166 males and 32,885,827 females. The number of males 18 years old and over was 18,947,561, and of females, 19,906,644. In view of the war, it is interesting to note the number of males returned by the 1910 census as having been born between the years 1879 and 1894 inclusive, that is, the number of males who, barring deaths, would have been from 20 to 35 years of age in 1914;

this number was 6,305,901. Of the total population in 1910, unmarried males and unmarried females numbered 19,516,340 and 18,591,604 respectively; married, 11,608,028 and 11,621,685; widowed, 866,676 and 2,583,872; divorced or separated, 49,122 and 88,666.

The 1900 census showed a foreign population of 778,737, of whom 314,463 female; the 1910 census, 1,259,873, of whom 542,879 female. Of the total in 1910, Austrians numbered 634,983, Dutch 144,175, Russians 137,697, Italians 104,204, Swiss 68,257, Hungarians 32,079, Danes 26,233, French 19,140, British 18,319, Americans 17,572, Luxemburgeois 14,356.

The increase in population is largely urban. Communes having less than 2000 inhabitants are regarded as rural. The aggregate population of such communes in 1871 was 63.9 per cent of the total; in 1890, 53.0 per cent; in 1900, 45.6 per cent; in 1910, 40.0 per cent. The aggregate population of communes having 100,000 or more inhabitants in 1871 was 4.8 per cent of the total; in 1890, 12.1; in 1900, 16.2; in 1910, 21.3. At the census of 1910, the empire comprised 75,939 communes, with 64,925,093 inhabitants. Communes with less than 2000 inhabitants numbered 72,199, with a population of 25,954,587. Communes with 2000 or more inhabitants numbered 3740, with a population of 38,971,406. Communes with 2000 to 4999 inhabitants numbered 2441, with a population of 7,297,770; communes with 5000 to 19,999 inhabitants, 1028, with 9,172,333; communes with 20,000 and less than 100,000, 223 with 8,677,955; communes with more than 100,000, 48, with 13,823,348. On Dec. 1, 1910, there were 576 communes with over 10,000 inhabitants each. The communal population of the larger cities, according to the 1910 census, was as follows (some of the figures are larger than the returns of the census, having been adjusted so as to include certain districts annexed subsequent to the census): Berlin, 2,071,257 (Greater Berlin, 3,710,000); Hamburg, 932,116; Leipzig, 626,267; Munich, 607,592; Dresden, 551,697; Cologne, 516,527; Breslau, 514,765; Frankfurt on the Main, 414,576; Düsseldorf, 358,728; Nuremberg, 333,142; Charlottenburg, 305,978; Hanover, 302,375; Essen, 294,653; Chemnitz, 287,807; Stuttgart, 286,218; Magdeburg, 279,629; Bremen, 247,437; Königsberg, 245,994; Stettin, 237,419; Neukölln (formerly Rixdorf), 237,289; Duisburg, 229,483; Dortmund, 214,226; Kiel, 211,627; Mannheim, 206,049; Halle, 180,843; Strassburg, 178,891; Berlin-Schöneberg, 172,823; Altona, 172,628; Danzig, 170,337; Elberfeld, 170,195; Gelsenkirchen, 169,513; Barmen, 169,214; Posen, 156,691; Aachen (Aix-la-Chapelle), 156,143; Cassel, 153,196; Brunswick, 143,552; Augsburg, 143,128; Bochum, 136,931; Karlsruhe, 134,313; Lichtenberg, 133,141; Krefeld, 129,406; Erfurt, 123,548; Plauen, 121,272; Mainz, 118,107; Mülheim on the Ruhr, 112,580; Berlin-Wilmersdorf, 109,716; Lübeck, 109,106; Wiesbaden, 109,002; Saarbrücken, 105,089; Mülhausen (in Alsace), 105,448; Hamborn, 101,703.

At the 1900 census, Evangelicals comprised about 62.5 per cent of the population, and Roman Catholics 36.1 per cent; at the 1910 census, 61.6 and 36.7. In 1910, Evangelicals numbered 39,991,421, Roman Catholics 23,821,453, other Christians, 283,946, Jews 615,021, others 214,152. The following table shows, according to the census of Dec. 1, 1910, the number of Evan-

gelicals (*E.*), of Roman Catholics (*R. C.*), of other Christians (*O. C.*), and of Jews (*J.*), per thousand inhabitants:

	<i>E.</i>	<i>R. C.</i>	<i>O. C.</i>	<i>J.</i>
Prussia	618.2	363.1	4.7	10.4
Bavaria	282.1	706.1	2.0	8.0
Saxony	940.5	49.1	5.3	8.7
Württemberg	685.6	808.6	5.3	4.9

1912	7.9	29.1	16.4	12.7	28.8	9.5	2.9

* For the ten-year periods, the annual average is shown.

German oversea emigrants in 1900 numbered 22,309, and foreign emigrants from German ports, 160,129; in 1905, 28,075 and 284,787; in 1910, 25,531 and 254,618; in 1911, 22,690 and 183,233; in 1912, 18,545 and 290,386; in 1913, 25,843 and 413,857. Of the German emigrants in 1913, 19,124 were bound for the United States, 140 for Brazil, 6120 for other American countries, 359 for Australia. Of the foreign emigrants from German ports in 1913, 352,251 were bound for the United States, 56,209 for other American countries, and 4814 for the United Kingdom.

EDUCATION. Illiteracy in Germany is almost negligible. In 1911, there were 61,557 public elementary schools, with 148,217 male teachers, 39,268 female teachers, and 10,309,949 pupils (5,157,446 boys and 5,152,503 girls); in addition, there were 480 private elementary schools, with 26,151 pupils (11,894 boys and 14,257 girls). Public middle schools in 1911 numbered 914, and private middle schools, 1135; male teachers,

1894

5147 and 1131; female teachers, 2384 and 3403; pupils, 273,394 and 80,660 (boys, 135,799 and 21,873; girls, 137,595 and 58,787). Higher schools for males numbered, in 1911, 1687, with 22,941 teachers, and 427,644 students; for females, 1,038, with 3012 male teachers, 9386 female teachers, and 234,461 students (not including 2051 boys under instruction at the girls' schools). Included in the higher schools for males were: 524 gymnasia, with 9769 teachers, and 160,237 students; 223 realgymnasia, with 3708 teachers, and 70,357 students; 167 oberrealschulen, with 3473 teachers, and 75,832 students; 81 progymnasia, with 570 teachers, and 9509 students; 63 prorealgymnasia, with 384 teachers, and 7252 students; and 411 realschulen, with 4265 teachers, and 89,968 students. Of the higher schools for females, 39 were gymnasia, with 432 male teachers, 607 female teachers, and 22,137 students.

Numerous institutions exist for higher, technical, and professional instruction. There are 11 degree-conferring technical high schools, at Aachen, Berlin, Brunswick, Breslau, Danzig, Darmstadt, Dresden, Hanover, Karlsruhe, Munich, and Stuttgart. These technical high schools, in the winter semester of 1912-13 had 11,003 regular students, while the total enrollment, including attendants upon lectures, etc., was 16,418, of whom 2312 were females; in the winter semester of 1913-14, regular students numbered 11,594, and the total enrollment was 16,871, of whom 1877 were females. Lyceums, with faculties of philosophy and Roman Catholic theology, are established at Bamberg, Brunswick (academy), Dillingen, Eichstätt, Freising, Passau, and Regensburg; these had, in the winter semester of 1913-14, 781 regular students, and a total enrollment of 967, of whom 63 were females. There are 21 universities; these, together with the Kaiser-Wilhelm Academy at Berlin, and the Posen Academy, had in the winter semester of 1912-13, 59,312 matriculated students (including 3213 females), and a total enrollment of 69,277 (including 5316 females); in the winter semester of 1913-14, 60,095 matriculated students (3686 females), and a total enrollment of 70,024 (5518 females). The following table shows the number of matriculated university students, and the total enrollment in the winter semester of 1912-13, and of 1913-14:

	1912-13		1913-14	
	Matric.	Total	Matric.	Total
Berlin	9,806	14,125	9,593	14,211
Kaiser-Wilhelm Academy	468	468	494	494
Bonn	4,179	4,479	4,270	4,550
Breslau	2,710	3,113	2,791	3,280
Göttingen	2,660	2,784	2,815	2,941
Greifswald	1,260	1,396	1,250	1,399
Halle	2,906	3,116	2,910	3,108
Kiel	1,738	1,800	1,847	1,923
Königsberg	1,616	1,872	1,568	1,675
Marburg	2,076	2,109	2,168	2,217
Münster	2,154	2,368	2,123	2,297
Posen (Academy)	...	851	...	830
Munich	6,759	7,718	6,802	7,664
Würzburg	1,455	1,548	1,515	1,586
Erlangen	1,261	1,307	1,341	1,388
Leipzig	5,351	6,323	5,532	6,463
Tübingen	1,898	2,016	1,887	2,013
Heidelberg	2,264	2,466	2,409	2,587
Freiburg in Breisgau	2,627	2,766	2,572	2,710
Giessen	1,338	1,525	1,340	1,514
Jena	1,842	1,927	1,862	1,944
Rostock	881	995	914	1,009
Strassburg	2,083	2,285	2,092	2,241
Total	59,312	69,277	60,095	70,024

In the winter semester of 1913-14, the number of matriculated university students in the several faculties was as follows: Evangelical theology, 4157 (including 11 females); Roman Catholic theology, 1685; law, 10,295 (including 65 females); medicine, 16,303 (880); philosophy, 25,784 (2617). The theological faculties at Münster, Munich, Würzburg, and Freiburg, are Roman Catholic; at Bonn, Breslau, Tübingen, and Strassburg, there are both Roman Catholic and Evangelical theological faculties; at the other universities, the theological faculties are Evangelical. In addition to the institutions mentioned, there are many schools for technical and special instruction.

AGRICULTURE. The total area of the country is stated at 54,085,760 hectares. So-called farm land in 1907 (the latest year for which statistics are available) comprised 43,106,486 ha. Of the farm land, 31,834,874 ha. (73.9 per cent) were under cultivation, 7,679,754 ha. (17.8 per cent) were profitable forest, and 3,591,858 ha. (8.3 per cent) were poor pasture, waste lands, yards, etc. The land under cultivation consisted of arable land, 24,432,354 ha. (56.7 per cent of the total farm land); meadows and sown pastures, 6,805,436 ha. (15.8 per cent); gardens, 481,716 ha. (1.1 per cent); and vineyards, 115,368 ha. (0.3 per cent). As compared with 1895, the year 1907 showed an increase in waste and forest land, and a slight decrease in cultivated land. In 1907, about 28 per cent of the population were supported by agriculture, as compared with about 35 per cent in 1895.

For some of the principal crops, the area harvested, in thousands of hectares, and the yield, in metric tons, are reported as follows (the areas for 1914 are provisional):

	1000 hectares			Metric tons	
	1912	1913	1914	1912	1913
Wheat	1,925	1,974	2,019	4,860,624	4,655,956
Rye	6,268	6,414	6,498	11,598,289	12,222,394
Barley	1,590	1,654	1,628	8,481,974	8,673,254
Oats	4,387	4,438	4,511	8,520,188	9,718,965
Potatoes	3,342	3,412	3,472	50,209,466	54,121,146

In 1913, 272,493 hectares were under spelt, yielding 438,469 metric tons; under hay, 5,923,647 ha., yielding 29,184,994 tons. In 1913, about 533,000 ha. were planted to sugar beets, and in 1914 about 569,000 ha. The areas under vines is gradually declining, from 119,873 ha. in 1904, to 105,876 in 1913; the yield varies greatly, having been 7.5 hectoliters in 1910, 26.6 in 1911, 18.6 in 1912, and 9.5 in 1913. The total yield of wine in the latter year was 1,004,947 hl. In 1912, 26,966 ha. were under hops, yielding 205,635 metric quintals; in 1913, 27,048 ha., and 106,179 qs. (of which Bavaria produced 66,583 qs.). The live stock census of Dec. 2, 1912, returned 4,523,059 horses, 13,147 mules and asses, 20,182,021 cattle, 5,803,445 sheep, 21,923,707 swine, 3,410,396 goats, 82,702,030 fowls, and 2,630,837 beehives. Horses increased in number from 4,195,361 in 1900, cattle from 18,939,692, swine from 16,807,014, and fowls from 64,453,171; while the number of sheep declined from 9,692,501. Census of Dec. 1, 1913: cattle, 20,994,344; sheep, 5,520,837; goats, 3,548,384; swine, 25,659,140.

FISHERIES. Value of the North Sea catch in 1912 and 1913, respectively: fish, 21,241,700 marks and 21,857,200 marks; shellfish, 798,400 and 962,200; other marine animals, 6700 and 5700; salt herring and other fishery products,

8,937,800 and 11,786,100; total, 30,984,600 and 34,611,200. Value of the Baltic catch in 1912 and 1913, including that of the bays (Stettiner Haß, etc.): fish, 10,554,500 marks and 10,341,100 marks; shellfish, 2900 and 6100; other animals regarded as marine (chiefly wild ducks), 24,700 and 31,000; total, 10,582,100 and 10,378,200. Total value of North Sea and Baltic catches in 1912 and 1913, 41,566,700 and 44,989,400 marks.

MINERALS AND METALS. The value of the mineral output of Germany (including Luxemburg) in 1912 is stated at 2369 million marks, as compared with 2086 million in 1911, and 2009 million in 1910. The production of the principal minerals in 1911 and 1912 are reported as follows, in thousands of metric tons: coal, 160,747 and 174,875; lignite, 73,774 and 80,935; iron ore, 29,879 and 27,200; zinc ore, 700 and 644; lead ore, 140 and 143; copper ore, 869 and 974; rock salt, 1436 and 1296; potassium salts, 9607 and 11,161. In 1913, the reported production of coal was 191,511,000 metric tons; lignite, 87,116,000; coke, 32,168,000; briquettes, 27,240,000. Output of pig iron in 1910 and 1911, 14,793,604 and 15,574,039 metric tons; zinc, 221,396 and 243,784; lead, 159,851 and 161,450; copper, 34,926 and 37,455; silver, 420.0 and 439.6; gold, 4625 and 4967 kilos; tin, 11,394 and 12,426 metric tons; sulphuric acid, 1,616,336 and 1,724,981. For 1913, the total output of pig iron was reported at 19,291,920 metric tons.

COMMERCE. Included in the customs territory is the grand duchy of Luxemburg. Total commerce, excepting goods merely in transit, is shown below in millions of marks:

	1908	1910	1912	1913
Imports:				
Merchandise	8,305.5	9,535.1	11,572.4	11,638.2
Coin and bullion	498.4	555.0	827.4	441.3
Total	8,803.9	10,090.1	11,899.8	12,079.6
Exports:				
Merchandise	7,019.3	8,079.7	9,684.2	10,891.2
Coin and bullion	133.0	852.9	142.9	102.8
Total	7,152.3	8,432.6	9,827.1	10,994.0

The special commerce, that is, imports for consumption, and exports of German produce, has been valued as follows, in millions of marks:

	1908	1910	1912	1913
Imports:				
Merchandise	7,666.6	8,934.1	10,691.8	10,770.3
Coin and bullion	410.5	375.9	325.7	436.4
Total	8,077.1	9,310.0	11,017.5	11,206.8
Exports:				
Merchandise	6,399.2	7,474.7	8,956.8	10,096.5
Coin and bullion	82.3	169.5	142.7	101.4
Total	6,481.5	7,644.2	9,099.5	10,197.9

Imports and exports of merchandise by great classes were valued as follows, in 1912 and 1913, in millions of marks:

	Imports		Exports	
	1912	1913	1912	1913
Raw materials	4,823.2	5,003.5	1,882.4	1,518.0
Partly mfd.	1,256.8	1,238.8	1,012.9	1,139.4
Manufactures	1,410.9	1,478.8	5,763.2	6,895.8
Food substances	2,944.9	2,759.5	789.4	1,035.9
Live animals	256.0	289.7	8.9	7.4
Total	10,691.8	10,770.3	8,956.8	10,096.5

The value of the principal imports of merchandise for consumption was as follows in 1913,

in millions of marks (figures in parenthesis for 1912): cereals, 1037.0 (1130.5); hides and skins, 672.4 (575.5); cotton, 664.1 (623.6); wool, 511.7 (527.0); chemicals and drugs, 421.8 (395.4); copper, 346.7 (320.0); timber, lumber, etc., 325.5 (355.5); live animals, 291.6 (252.9); coal, 289.6 (275.7); iron, 238.3 (213.3); copra, coconuts, etc., 225.9 (195.3); coffee, 219.7 (252.7); silk, 193.3 (222.9); eggs, 188.2 (187.5); fruits, 148.8 (126.0); rubber and gutta-percha, 146.1 (184.2); fish, 135.9 (126.5); leaf tobacco, 134.3 (135.6); wheaten products, 130.3 (186.8); linseed, 129.7 (104.8); animal fats, 118.9 (111.2); butter, 118.7 (126.3); oilcake, 118.6 (116.5); cotton yarn, 116.2 (104.0); flax and hemp, 114.4 (120.4); woolen yarn, 108.0 (107.6); rice, 103.9 (102.8); southern fruits, 101.2 (94.2); tin, 101.1 (107.2); jute, 94.0 (74.7); iron manufactures, 93.7 (97.9); meats, 81.4 (84.8); machinery, 80.4 (77.1); seeds, 78.3; silk goods, 73.7 (76.5); furs, etc., 72.5 (78.9); petroleum, 69.9 (62.9); lead, 67.3 (64.0); cacao, 67.1 (63.6); zinc, 64.0 (71.9); wines, 62.4 (65.9).

Value of the principal exports of domestic produce in 1913, in millions of marks (figures in parenthesis for 1912): iron manufactures, 1337.6 (1185.8); coal, 722.6 (611.9); machinery, 680.3 (630.3); chemicals and drugs, 658.0 (546.4); cotton goods, 446.5 (421.6); cereals, 421.7 (341.6); paints, dyes, colors, etc., 298.1 (278.2); electrical apparatus, 290.3 (239.7); woolen goods, 270.9 (253.4); sugar, 266.6 (132.2); paper, 262.8 (232.2); leather, 242.9 (230.1); copper manufactures, 240.7 (184.7); silk goods, 219.5 (205.2); furs, etc., 193.8 (182.2); hides and skins, 178.4 (182.3); ships, 175.2 (155.9); woolen yarn, 166.3 (84.2); glass and glassware, 146.1 (119.5); apparel, 132.0 (118.3); rubber manufactures, 128.3 (120.5); leather manufactures, 114.2 (98.1); vegetable oils, 113.7; pottery, 112.8 (102.0); wool, 112.6 (117.3); books, maps, etc., 104.8 (96.1); toys, 103.3 (92.3); cotton, 86.8 (80.7); musical instruments, 84.0 (78.0); gold and silver manufactures, 73.7 (66.9); wooden manufactures, 73.0 (68.5); cotton yarn, 61.1 (64.1); seeds, 50.2 (52.8).

The value of imports of merchandise for consumption, and of exports of domestic produce by countries in 1912 and 1913 was as follows, in millions of marks:

	Imports		Exports	
	1912	1913	1912	1913

At the outbreak of the war the railways were for the most part put on a military basis, and a war time-table, a general scheme of mobilization prepared for such occasions and in possession of railway officers, was carried out. It must be remembered that in addition to its main commercial traffic lines Germany had a number of short strategic lines on French and Belgian frontiers, built largely for military reasons.

During the year, in consequence of the war, the Germans were busy developing a network of strategic railways, and it was stated that between Berlin and Cologne no fewer than eight sets of railway lines had been laid down. The record for efficient and safe operation of passenger traffic in Germany was not altogether maintained during the unusual conditions established by the war in the operation of military railways. While details were not forthcoming, yet at least one serious accident due to the collision of a troop train with a freight was recorded. The effects of the war on the railways were felt during the year in many ways. The loss in traffic assumed enormous dimensions and certain classes of goods were being carried at reduced rates in order to bring them to a neutral market at a price which with the war insurance would make them saleable. Often such goods had to be taken on expensive railway journeys in order to put them at a neutral market, and the Hamburg Merchant's Association appealed for a reduction of rates, of 50 per cent on this account. At the beginning of 1914 the total length of the Bavarian State Railway system was about 4950 miles, of which somewhat less than 120 miles had been built during 1913. In 1914 only a few miles of purely local lines had been added, and but little if any construction was under way. In three successive years a total of \$3,450,600 was voted for the electrification, of which \$1,846,800 figured in the 1914-15 budget, though it was doubtful whether on account of the war any of this expenditure could be undertaken.

The imperial administration of posts and telegraphs embraces all the German States except Bavaria and Württemberg; these kingdoms operate, under certain limitations, their own postal and telegraphic systems. In addition to the State telegraphs, there are railway telegraph lines and some private lines. The figures in the following table relate to the year 1913 (the figures for the Empire are exclusive of those for Bavaria and Württemberg); A number of post offices, B State telegraph offices, C railway and private telegraph offices, D total telegraph offices, E length of State telegraph lines in kilometers, F length of State telegraph wire, G number of places (towns, etc.), having telephonic communication, H length of urban tele-

phone lines in kilometers, *I* length of urban telephone wire, *J* length of interurban telephone wire, *K* receipts of posts, telegraphs, and telephones in thousands of marks, *L* expenses, *M* excess of receipts:

	Empire	Bavaria	Württemberg	Total
A	34,860	5,855	1,200	41,415
B	38,315	6,028	2,347	41,685

M	89,692	16,418	9,039	115,149

*Exclusive of 17 radiotelegraph stations and 213 on board ship.

FINANCE. The monetary unit of Germany is the mark, whose par value is 23.821 cents. The imperial revenue and expenditure (ordinary, extraordinary, and total) have been as follows, for fiscal years, in thousands of marks:

Revenue:				
	1909	1910	1911	1912
Ord.	2,632,276	2,801,906	2,943,179	2,827,194
Extr. ...	674,845	141,514	114,413	88,190
Total	3,307,120	2,943,419	3,057,592	2,915,384
Expend:				
Ord.	2,623,916	2,767,588	2,683,175	2,707,365
Extr. ...	642,529	256,672	214,228	185,973
Total	3,266,445	3,024,261	2,897,403	2,893,338

The imperial budget for the year ended March 31, 1914, balanced at 3,696,033,215 marks (including extraordinary revenue and expenditure balancing at 118,634,500 marks). The budget for the fiscal year 1915, pursuant to laws of May 27 and Aug. 4, 1914, balanced at 8,797,930,350 marks (including extraordinary revenue and expenditure balancing at 5,392,752,000 marks). Of the extraordinary estimated revenue for the fiscal year 1915, loans accounted for 5,886,878,478 marks; and the estimated extraordinary expenditure voted for war was 5,300,000,000 marks. For the fiscal year 1915, the larger classes of estimated ordinary revenue were: customs, excise, stamps, etc., 2,075,103,771 marks (customs, 712,930,000; military contribution, 393,820,000; imperial stamps, 250,085,000; spirits excise, 193,995,000; sugar, 163,252,000; beer, 128,950,000, etc.); matricular contributions of the several States (exclusive of their contributions from spirits excise), 51,940,794; posts and telegraphs, 831,286,500; railways, 162,246,000. Larger estimated disbursements for the fiscal year 1915, including ordinary (permanent and transitory) and extraordinary: extraordinary expenses of the war, 5,300,000,000 marks; regular military administration, 1,238,004,127 (as compared with 1,368,685,243 marks estimated for the fiscal year 1914); posts and telegraphs, 818,789,569 (734,533,884); administration of the navy, 484,924,447 (480,253,894); debts of the Empire, 255,390,140 (243,557,366); general direction of finance, 191,057,062 (290,168,213); pensions, 145,276,920 (142,542,052); administration of the railways, 152,375,931 (139,671,611); interior, 128,142,374 (159,148,032); imperial treasury, 47,903,893 (43,975,875).

In October, 1913, the interest-bearing debt of

the Empire was 5,177,225,300 marks, having increased 94,983,300 marks since October, 1912. The noninterest-bearing debt was: treasury bonds, 160,000,000 marks; paper money, 120,000,000. Total debt, 5,177,225,300 marks. At Spandau was kept a war fund of 120,000,000 marks in gold.

The interest-bearing debt plus outstanding paper money has stood as follows: in 1870, 485,601,300 marks; in 1880, 377,526,600; in 1890, 1,240,908,800; in 1900, 2,418,517,700; in 1905, 3,323,500,000; in 1910, 5,016,633,500; in 1911, 4,943,656,700; in 1912, 4,922,242,000; in 1913, 5,017,225,300.

ARMY. As detailed statistics of the strength and organization of the German army engaged in the great European War are manifestly impossible at the time the YEAR BOOK goes to press, it may be of advantage to consider the previous normal organization and strength of the military forces of the empire, and how they might be expanded to a war basis, as they were in 1914, when it was estimated that the united mobilization following the declaration of war on Russia, August 1, put into the field 1,000,000 rifles, 80,000 sabres, and 55,000 field guns.

Military service in Germany is obligatory from the beginning of the eighteenth year to the beginning of the forty-sixth. Under peace conditions the recruits are called up at the beginning of their twenty-first year. Normally those selected serve two years with the colors (three in the cavalry) and then pass to the active reserve for five years, or until the beginning of the twenty-eighth year. During this five-year period this reserve has two periods of training of about six weeks. Thence the men pass into the Landwehr, or second line army, which is divided into two "bans," the first comprising those between the ages of 27 and 32, and the second those from 32 to 39 years. From here the men pass into the second ban of the Landsturm, composed of all men between the ages of 39 and 45, and forming a reserve for home defense. Accordingly all men in the Landwehr have received active military training at least two years with the standing army, and five years in the reserve, in addition to two training periods of a week to a fortnight during the first half of their 12 years in the Landwehr itself. The Landsturm is composed of trained and untrained men, the former obviously being the Landwehr men, who at 39 years of age pass into the second ban of the Landsturm, while the untrained are those between 17 and 45 years of age, who have not been trained on account of lack of physical qualification, or because the contingent was in excess of the requirements, this being the usual case since the quota annually conscripted is probably twice as large as can be put under the colors. One-year volunteers made up of educated young men pay their own expenses and are specially trained to become commissioned officers in the reserve and Landwehr. There is also the Ersatz Reserve, upon which when war breaks out the call is first made for new training material. In the course of time the Ersatz men go into the Landsturm, being distinctly available as they are for the most part young men.

The scheme of organization provides for the bringing up to war strength of the various peace units by calling in the reserves, and with the inevitable wastage of war the Landwehr is

drawn upon to make good the losses. Consequently, the war of 1914 was not in progress many weeks before the first line men of the reserves and Landwehr were serving in every German corps that was at the battle front, while in addition there were separate units of reserve and Landwehr organized into corps. The Landsturm in time of peace possesses no military organization and undergoes no training, but the German war plans unquestionably provided for the utilization and organization of this branch, as efficiently as other features of the military programme. The plan followed was to call out the unmarried men first and then the married men without children, and finally the others according to the number of their children. In the reserve the soldiers underwent military drill for two weeks each year, while the officers have all in all three exercises of eight weeks each. The first levy of the Landwehr is drilled twice, two weeks each time. The following was an estimate at the outbreak of the war of the effectives of the various reserve forces:

RESERVE EFFECTIVES

Reserve	1,060,000
Landwehr, First Levy	1,000,000
Landwehr, Second Levy	1,200,000
Ersatz reserve (trained but not armed)	10,500
Ersatz reserve (untrained)	880,000
Landsturm, First Levy (17 to 20 years)	1,250,000
Landsturm, First Levy (21 to 39 years)	1,700,000
Landsturm, Second Levy (trained)	1,000,000
Landsturm, Second Levy (untrained)	1,150,000

To what extent the above was drawn upon in the year 1914, so far as military critics could determine, was largely a matter of conjecture.

The German army, on a peace basis in 1914, consisted of 25 army corps, recruited as follows in territorial military districts: in the Kingdom of Prussia, Baden, and Hesse, 16; the Prussian Guard Corps, from the entire kingdom, 1; in Saxony, 2; in Württemberg, 1; the Reichsland (Alsace and Lorraine), 2; Bavaria, 3; in all, 25 army corps and 1 permanent cavalry division. The corps were organized into armies by assigning them to inspection districts, each of which was provided with a headquarters and staff. Normally 2 regiments of infantry (6 battalions) form a brigade (except the second guards, the fifth, forty-ninth, fifty-fourth, and sixty-second, which had 3 regiments), 2 brigades a division, and 2 divisions an army corps. There were 10 divisions, however, which had 3 brigades, and in war the scheme called for the addition of a brigade of reserve troops, to each division, so that the field army corps would consist of 6 brigades (36 battalions) and the necessary artillery regiments. To each infantry division was attached an artillery brigade of 12 batteries (72 guns), a regiment of 4 squadrons of cavalry; to each army corps, 4 batteries of howitzers, a pioneer (engineer) battalion, and a battalion of rifles (Jäger) are also attached. Cyclist companies, of which there were 18, were assigned as needed. Field batteries had 6 guns. The complete German division of 2 brigades had about 14,000 combatants; the corps of 2 divisions, 30,000. The division, increased in war to 3 brigades, gives 6 brigades to the war corps, amounting in all to about 43,000 combatants.

There was but one permanent cavalry division, but in war provision was made for the immediate formation of eight more from existing cavalry brigades, regiments, and squadrons.

Strength, 3 brigades of 2 regiments each, with 2 or 3 batteries of horse artillery—in all, 24 squadrons and 8 or 12 guns.

Four companies of infantry form a battalion, 3 battalions and a machine gun company a regiment, 2 regiments a brigade, 2 brigades to the division, with one of the divisions in a corps having an extra battalion of sharpshooters (Jägers, or Schützen), of which there were 18, each with the same organization as the infantry but with 4 companies. The war-strength infantry battalion counts about 25 officers and 1000 rifles, 60 horses, and 19 vehicles, which gives for the war company about 250. The law of 1913 provided for 651 battalions.

Five squadrons of cavalry form a regiment, 2 regiments to the brigade. The German squadron consists, on a war footing, of 6 officers and 172 men, with a fighting strength of 150. The fifth squadron is used to fill up the others and becomes a depot squadron. There were 550 squadrons before the outbreak of the war. Three batteries of field artillery form a battalion, 2 battalions to the regiment, 2 regiments to the brigade. The German light battery has 6 guns. Horse batteries have 4 guns. In peace the batteries vary in strength from 4 officers and 102 men to 4 officers and 128 men. In war the battery counts 5 officers and 150 men. Each German battalion in war has in addition a light ammunition column of 4 officers and 188 men.

Organization of the foot artillery varies greatly. A typical formation is 4 batteries to the battalion, 2 battalions to the regiment. There were 49 battalions forming 190 batteries at the beginning of the war. The heavy howitzer battalion numbered 1230 officers and men, including light ammunition train. One battalion of these was assigned to each corps. Each had 4 batteries of 4 guns each. Field and foot (fortress) artillery officers are on one list. Changes with changes of material naturally occurred during the war.

Under the Law of 1913, 5 aeroplane battalions (17 companies) were organized, and before the war there were between 25 and 30 dirigibles. The total personnel at that time was 173 officers and about 4500 enlisted men.

Germany divides its technical troops of this class into pioneer troops (131 companies, 33 battalions), and Verkestruppen (lit., communication troops). The latter are further divided into railroad troops (7 battalions), telegraph troops (6 battalions), aërostation and aviation troops, automobile troops, etc. The 18 companies of cyclists are included in the strength of the infantry.

Supply train consisted of 25 battalions, each battalion composed of 3 companies and a bakery detachment. Strength, 631 officers, 10,961 enlisted men, and of course capable of expansion on a war base.

At Kiauchow, German marines and sailors, supplemented by native troops totalling about 4000 all ranks, were in service previous to the capture of the fortress of Tsingtau by the Japanese on November 5. Colonial troops, not included in the army, 340 officers, 2250 noncommissioned officers and men, 3830 native soldiers. In Southwest Africa there was a German force of about 150 officers and 2000 men, and in addition there were 600 native police with German officers. These forces were in conflict with the British after the outbreak of the war. There

were also forces in East Africa and Kamerun.

The German infantry uses the Mauser magazine rifle, calibre 0.311 inch; the cavalry, the carbine of same type. Field and horse artillery use a Krupp gun firing a 15-pound projectile. The light and heavy field howitzers fire 30- and 94-pound projectiles respectively, while special heavy ordnance was used with effect during the war. See **KRUPP**.

The seacoast and land frontier of Germany amounts to about 4600 miles. The country before the war was divided into 10 fortress inspection districts, each including fortified places as follows: 1. *Königsberg*: Königsberg, Danzig, Pillau, Memel, Bogen. 2. *Posen*: Posen, Glogau, Neisse, Glatz. 3. *Berlin*: Spandau, Magdeburg, Torgau, Küstun. 4. *Mainz*: Mainz, Ulm, Rastatt. 5. *Metz*: Metz, Diedenhofen, Bitsch. 6. *Cologne*: Cologne, Koblenz, Wesel, Saarlouis. 7. *Kiel*: Kiel, Freidrichsort, Cuxhaven, Geestmünde, Wilhelmshaven, Swinemünde. 8. *Thorn*: Thorn, Grandanz, Vistula Passages, Dirschau. 9. *Strassburg*: Strassburg, New Breisach. 10. Munich, Ingolstadt, Germersheim.

NAVY. The German navy, as officially reported, included in the summer of 1914, the following (number, displacement, indicated horsepower):

	No.	Tons	I. H. P.
Ships of the line	37	608,500	716,600
Armored coast guards	8	82,900	40,000
Large cruisers	19	221,200	485,000
Small cruisers	38	130,200	520,100
Gunboats	11	9,520	17,300
School ships	7	20,200	18,950
Special ships	13	18,490	34,890
Total	133	1,041,010	1,832,840

The foregoing list is evidently exclusive of torpedo-boat destroyers.

The summary which follows is taken from a statement of the Office of Naval Intelligence at Washington, relating to July 1, 1914. Number and displacement of warships of 1500 or more tons, and of torpedo craft of 50 or more tons, built and building: Dreadnoughts (battleships having a main battery of all big guns, that is, 11 or more inches in calibre): built, 13, of 285,770 tons; building, 7, of 187,164 tons. Pre-dreadnoughts (battleships of about 10,000 or more tons displacement, whose main batteries are of more than one calibre): built, 20, of 242,800 tons; building, none. Coast-defense vessels: built, 2, of 8168 tons; building, none. Battle cruisers (armored cruisers having guns of large calibre in main battery and capable of taking their place in line of battle with the battleships): built, 4, of 88,749 tons; building, 4, of 112,000 tons. Armored cruisers: built, 9, of 94,245 tons; building, none. Cruisers: built, 41, of 150,747 tons; building, 5, of 26,900 tons. Torpedo-boat destroyers: built, 130, of 67,094 tons; building, 24, of 14,400 tons. Torpedo boats, none built or building. Submarines: built, 27, of 14,140 tons; building, 18, of 14,400 tons. Total tonnage: built, 951,713; building, 354,864. Excluded from the foregoing: ships over 20 years old from date of launch, unless reconstructed and rearmed within five years; torpedo craft over fifteen years old; vessels not actually begun or ordered, although authorized; transports, colliers, repair ships, torpedo-depot ships, and other auxiliaries. The battle cruiser *Goeben* (22,640 tons) and the cruiser *Breslau* (4550 tons) were reported as sold to

Turkey after the outbreak of the war in 1914.

The active personnel in the summer of 1914 was reported at 79,197, including 2 admirals of the fleet, 6 admirals, 12 vice-admirals, 22 rear-admirals, 154 captains and commanders, 2220 other line officers, 448 midshipmen at sea, 577 engineer officers, 340 medical officers, 276 pay officers, 162 naval constructors, 30 chaplains, 3183 warrant officers, 65,797 enlisted men, 177 marine officers, and 5791 marines. See also **NAVAL PROGRESS**.

GOVERNMENT. The German Empire is a Federal State, with a constitution in force from May 4, 1871, and amended March 19, 1888. The constitution vests the executive power in the King of Prussia as German Emperor; he has power also to conclude treaties with other nations, to make war (if defensive) and peace, and to appoint and receive diplomatic representatives. In 1914 the Emperor was William II; he was born Jan. 27, 1859, and succeeded to the throne June 15, 1888. Heir-apparent, Prince Frederick William, born May 6, 1882.

The Imperial Legislature consists of the Bundesrat, or Federal Council (61 members appointed for each session by the governments of the several States), and the Reichstag (397 members elected for five years by direct vote).

The Imperial Ministers, or Secretaries of State, do not form a ministry proper, but act independently of each other under the general supervision of the imperial Chancellor, who is the highest official of the Empire. The Chancellor, who is president of the Bundesrat, is appointed by the Emperor without reference to the political majority in the Reichstag, and to the Emperor he is directly responsible. Imperial Chancellor (and Prussian Prime Minister) in 1914, Theobald von Bethmann-Hollweg (from July 14, 1909). The Imperial Secretaries of State in 1914 were: Secretary of State for Foreign Affairs, Gottlieb von Jagow (succeeding Alfred von Kiderlin-Waechter, who died Dec. 30, 1912); interior, Klemens Delbrück (from July 14, 1909); marine, Grand Admiral Alfred von Tirpitz (from June 15, 1897); justice, Hermann Lisco (from Nov. 1, 1909); treasury, Hermann Kühn (from March 16, 1912); posts and telegraphs, Reinhold Kraetke (from 1901); colonies, Wilhelm Solf (from Dec. 20, 1911).

HISTORY

CONSEQUENCES OF THE ZABERN INCIDENT. Political issues of prime importance were involved in the Zabern affair, of which some account was given in the 1913 **YEAR BOOK**. The incident in itself was trivial enough—the arrogant bearing of a young German army officer, a nobleman, in an Alsatian town had led to a conflict between the garrison and the townsfolk. But as the Imperial Ministry supported the garrison officer, and as the Kaiser supported the Imperial Ministry, in defiance of the Reichstag's overwhelming vote of no confidence, the dispute over the Zabern incident assumed the aspect of a battle for civil liberty and for responsible government. If the officers in question, Lieutenant von Forstner and Colonel von Reutter, were allowed to escape without punishment, it would mean that army officers could henceforth with impunity ride roughshod over the civil population; if the government continued to disregard the wishes of the Reichstag, one more triumph would have been scored for autocracy. The very

greatest interest was therefore centred in the proceedings of the military court which was considering the cases of Lieutenant von Forstner and Colonel von Reutter. Late in December, 1913, the court-martial sentenced Lieutenant von Forstner to 43 days' imprisonment for violence and abuse of military privilege. Herr von Jagow, chief of the Berlin police, publicly expressed the opinion that the decision was wrong in principle, because it tended to destroy the authority of army officers. Early in January the court-martial acquitted Colonel von Reutter, of the Ninety-ninth Infantry, of the charge of improper usurpation of police power which had been brought against him for supporting young Von Forstner in the feud between the garrison and the town. Colonel von Schad, also involved in the case, was likewise acquitted. Furthermore a Superior Court-Martial shortly afterwards acquitted Von Forstner, on appeal from the lower court. It was an unqualified triumph for the military aristocracy; and it was rendered all the more conspicuous by the publication of a telegram which the Crown Prince sent to congratulate Von Reutter upon the acquittal. As an indication of the character of the army officers who were thus vindicated, it is interesting to note that in February suit was brought against Von Forstner for seducing the young daughter of a workman. In order to prevent further trouble in Zabern, the obnoxious young lieutenant was transferred to a command at Bromberg in Prussian Poland, and Colonel von Reutter was given command of a distinguished grenadier regiment at Frankfort-on-Oder. The Ninety-ninth Infantry, however, which had been temporarily removed from Zabern, was allowed to return, with band playing, to its old quarters, on April 18. The Zabern incident came up for discussion in the Reichstag during the fourth week of January, as well as in the legislatures of Alsace-Lorraine, Prussia, Bavaria, and Baden; but protests were futile. In April the Prussian government published a new regulation for troops under Prussian military administration, regarding the use of arms in time of peace, and serving to give at least a clearer definition of the prerogatives of the military.

THE REICHSTAG. The spring session of the Reichstag afforded more than one opportunity for the Imperial government to reiterate its determination to shield the military aristocracy against the Reichstag. When on March 13 the Centre party interpellated the government regarding duelling in the army and complained that the government had not taken steps to suppress the evil in accordance with the law and the expressed will of the Reichstag, the answer given by Minister of War Von Falkenhayn was no more nor less than a defense of duelling. The army, he said, had need of officers who valued their honor more than their lives; he would not for a moment consider a military prohibition of duelling; but he thought that the small number of duels fought in 1913—only 16—pointed to the dying out of the custom. The Reichstag then gave expression to its indignation by passing an ineffective resolution in favor of the imposition of more severe penalties on duelling. Likewise in regard to the modification of the penal code, the Reichstag's will, embodied in a Bill, was set at naught by the government and declared unacceptable. Another quarrel between Reichstag and government was

caused in May by the government's refusal to sanction a measure which the Reichstag passed for an increase in the salaries of certain classes of government employees. On May 20 the session of the Reichstag was closed. It had produced: (1) A Law to prevent the betrayal of military secrets; (2) A Law for the revision of fees payable to witnesses and experts; (3) A Law to facilitate the construction of dwellings for Imperial and military authorities and workers; (4) Extension of the Mail Ship Subvention Law to promote communication by sea with East Asia and Australia. The Sundays Rest Bill, the Succession Rights of the State Bill, the Petroleum Monopoly Bill, and other important measures were not completed at the close of the session and had to be dropped. At the closing sitting of the Reichstag, when President Kaempf proposed the customary cheer for the Kaiser (*Hoch auf den Kaiser*), the Social Democrats, instead of leaving the hall as in former years, remained seated and silent as a manifestation of their republican convictions. A disorderly scene ensued, and for a week or more the bourgeois press was filled with angry comment upon the Socialist affront to the Kaiser.

CAMPAIGN AGAINST THE SOCIALISTS. The refusal of the Social Democrat deputies to honor the *Hoch auf den Kaiser* was their reply to the campaign against Social Democracy which of late the government had been prosecuting with unusual vigor. In the course of the January budget debates, Secretary of State Delbrück had announced that the government considered it advisable to discontinue the work of social legislation. For the present no more laws were to be enacted for the amelioration of the social and economic condition of the working classes at the expense of the State and of the employer. At a meeting of the German Agricultural Council, the Imperial Chancellor von Bethmann-Hollweg declared the intention of the government to fight against the menace of Socialism. It was obvious that the Prussian Conservative landed nobility—*Junkertum*, as it has been called—was behind the government in the war against the party of social revolution. Alarmed at the belligerent attitude of the government, and anxious to recover the power of growth which their party seemed to have lost since the last election, the Social Democrats instituted a Red Week from March 8 to March 14, during which time they carried on an active propaganda and held numerous meetings. (Consult the article on **SOCIALISM, Germany**.) The following week witnessed the session of the German Trade Congress (*Handelstag*) in Berlin, which strenuously condemned the government and the Reichstag for neglecting business interests. In behalf of the business interests, the Congress protested against social legislation and socialistic taxation. In April the Central Committee of the National Liberal party, the party which had once been expected to coöperate with the Social Democratic party in a *bloc* of the Left, issued the command that henceforth National Liberal candidates in electoral contests must refrain from making promises to any other parties, and above all to the Social Democrats.

THE CENTRE PARTY. During the spring of 1914 the Centre or Catholic Party was profoundly perturbed by a revival of the old dispute as to whether loyal Catholics should en-

courage the participation of Catholic workmen in the Christian Trade Unions, which included workmen who were not Catholics. The controversy was reopened by the prince-bishop of Breslau, Cardinal Kopp, who in a letter to Count Oppersdorf sharply attacked the advocates of Catholic participation in the Christian Unions. Cardinal Kopp retracted his letter in February, but the Centre Party had already taken alarm and issued a statement deprecating any controversy which might have the effect of undermining popular confidence in the party; for the Centre had favored the Christian Unions. As a counterblast to the statement of the Centre, the bishops of Trier, Osnabrück, Paderborn, Hildesheim, and Münster, and the Archbishop of Cologne issued a declaration that interconfessional trade unions were tolerated rather than favored by the clergy. Thereupon the Central Committee of the Centre party met at Essen and declared that the party was not subject to the authority of ecclesiastical dignitaries, and again pronounced in favor of the Christian Unions. The "Berlin tendency" towards the rigid insistence upon separate Catholic unions was rebuked. On March 1 a meeting was held in Cologne at which some 4000 voices were raised against attempts to divert the Centre party from its old policy of friendliness to the Christian Unions. On March 4 Cardinal Kopp, the weaver's son who had risen to the dignity of prince-bishop, suddenly died, and the controversy which he had begun was dropped for the time being. Again in July, however, the Centre party's programme was attacked, this time by the Italian bishop of Como. Another circumstance over which the Catholics of Germany were much exercised was the allegation made by several journals in April that the Kaiser had written a letter to the landgravine of Hesse on the occasion of her conversion to the Catholic faith, declaring his hatred for the Catholic religion which she had seen fit to embrace. A *communiqué* was issued by the government, however, emphatically denying that the letter was more than a family affair, or that it contained any attack upon the Roman Catholic Church.

DIPLOMACY AND DEFENSE. The first half of the year was signalized by notable diplomatic exertions concurrent with important defensive preparations on the part of Germany. In the first two months attention was mainly occupied by the unsettled state of affairs in the Balkans, and by the attempt of Sir Edward Grey to bring about a settlement. While the British policy was officially complimented, there was not complete satisfaction in Germany, as it was felt that interests of the Triple Alliance had suffered because of the Balkan Wars. In regard to Anglo-German naval competition, Von Tirpitz declared his willingness to acquiesce in the British 16 to 10 superiority, but he declined Mr. Churchill's proposal for a year's suspension of naval construction. When Great Britain was ready to make more definite propositions to abate the ruinous competition in armaments, Germany would give them careful consideration. In the meantime, the strengthening of the German navy continued. In March Russia rather than Great Britain occupied the centre of the stage. Starting with articles in the *Cologne Gazette* and in *Germania*, a furious press campaign was conducted against Russia. For a time free rein was allowed to the pan-German journals, and a

high pitch of excitement was reached. Then the scare was declared to be without foundation by semiofficial organs and a mild rebuke was administered to the Jingo journalists by State Secretary von Jagow. The month of March, which witnessed the Russophobia campaign in the press, was also remarkable for the Kaiser's visit to Francis Joseph at Schönbrunn, to Victor Emmanuel at Venice, and to Francis Ferdinand at Castle Miramar; and the extraordinarily long conferences held on these occasions with the foreign ministers of Austria-Hungary and of Italy indicated more than a perfunctory courtesy as the motive of the Kaiser's journey. In May, during the budget discussions, Von Jagow freely bespoke the dangerous character of the recent agitation in the press, but at the same time laid stress on the friendship of Germany for England and upon the solidarity of the Triple Alliance. In the same month the Minister of War, Von Falkenhayn, stated that the great army increase decreed in the summer of 1913 had been effected, and the army was in splendid shape. The enormous Defense Levy, it should also be remembered, was paid in the summer of 1914. On June 24 the Kiel canal, which had been enlarged to permit the passage of the largest warships, was reopened with great ceremony. By affording a ready means of transit from the Baltic to the North Sea, the enlarged canal tremendously augmented the effective power of the German navy. In June, too, the Kaiser visited the ambitious Archduke Francis Ferdinand, heir to the Austrian crown, in the latter's castle Konopischt; and at the special request of the Archduke, Grand Admiral von Tirpitz, Secretary of the Navy, accompanied the Kaiser.

THE GREAT WAR AND THE GERMAN NATION. The crime at the close of June and the crisis at the close of July which led to the greatest war in history, and the part borne by Germany in the precipitation and in the operations of the war, are discussed at some length in the article on the **WAR OF THE NATIONS** (q.v.). In this place may be noted only a few of the more prominent features of Germany's internal history during the historic second half of the year 1914. A day before Austria-Hungary declared war on Serbia, the Kaiser interrupted his tour in the North and returned to the palace at Potsdam, where he conferred with the Chancellor, the naval authorities, and the chief of the general staff. On July 31, in the afternoon, he arrived in Berlin, and made a speech from the balcony of his palace, using the striking words: "The sword is being forced into our hand. I hope, if at the last hour my exertions do not succeed in bringing our opponents to their senses and preserving the peace, that we shall wield the sword with God's help in such manner that we may sheathe it again with honor." A few minutes before midnight, still on July 31, the Imperial Chancellor used almost the exact words of the Kaiser, that the sword was being thrust into the hand of Germany. This was before the war began. Not until the following day, August 1, at half past five in the afternoon, was the official order issued for the German army to mobilize for war against Russia. Crowds surged through the streets of Berlin cheering and singing patriotic songs. The war found the German nation superbly confident and tremendously patriotic.

At one o'clock in the afternoon of August 4 the Kaiser received the Reichstag in special session in the White Room of the Royal Palace, and from the Throne read a speech that has already become historic, declaring that Germany had now to defend herself against the Chauvinism of Russia and the malice of France, and concluding with a stirring appeal to German loyalty. At the close of his speech, the Kaiser added, "... I no longer recognize parties, I recognize only Germans; and in proof that they are firmly determined to stand by me, without distinction of party, without difference of class or of creed, through thick and through thin, through distress and through death, I summon the leaders of the parties to step forward and give me their hands upon it." At three o'clock the same day the Reichstag held a special sitting to hear Von Bethmann-Hollweg's version of the causes of the war. At five, a second sitting was opened by the president, Dr. Kaempf, who read all the War Bills which the Reichstag was asked to pass. The Social Democrat Haase promised the consent of his party in advance. The Bills were unanimously passed amidst lusty cheering. A war expenditure of \$1,250,000,000 was authorized. Then the session was adjourned to November 24. This time the Social Democrats stood up for the *Kaiserhoch*. After the feverish excitement of the first few days of mobilization, the German government set about the serious problems of financing the war, protecting industry, and relieving want. In September a loan of a billion marks, the first installment of the authorized war credit, was issued in 5 per cent Imperial Treasury Bills; thirty millions were immediately subscribed by the firm and family of Krupp. So favorable was the reception of the loan, that, by October 15, 4,500,000,000 marks had been subscribed, and by October 21 more than three billions had been paid in cash. By the formation of special institutions of credit, and thanks to a favorable financial situation, Germany was able to avoid declaring a general moratorium. Food supply and prices were regulated by the Bundesrat. A good grain crop was harvested, notwithstanding mobilization. The textile and metal industries were able to survive the crisis without serious paralysis, although some other industries were less fortunate. For example, at the end of November the report was received from German sources that whereas only 9 per cent of the members of the metal workers' union were out of work, the greater part of the female factory workers were unemployed. The Kaiser in August contributed 50,000 marks for the relief of the unemployed in Berlin.

The second war session of the Reichstag in December voted a second war credit of 5,000,000,000 marks, with only one dissenting vote. That vote was cast in the negative by the Social Democrat, Karl Liebknecht, who alone of the Socialist deputies remained true to the conviction that the only war in which workingmen should fight is the war against capitalist domination. Many of the Social Democratic deputies, who had in past years solemnly discussed the feasibility of calling a general strike in case of war, and had many times denounced the undemocratic character of the German government, at the outbreak of war, without a murmur, had pledged their loyalty to Kaiser and country; some had even given their lives

for the Empire. But Liebknecht and a few other Socialists—the uncompromising Rosa Luxemburg, Franz Mehring, and Clara Zetkin—in November issued a manifesto, which was published in Switzerland, declaring that they held opinions about the war which were not shared by the other Social Democrats, and which could not be expressed during the reign of martial law. The adverse vote of Dr. Liebknecht in the Reichstag, following upon the November manifesto, gave clear proof that at least a minority of the Socialists had not been swept off their feet by the German nation's outburst of patriotic emotion. See also *INTERNATIONAL ARBITRATION AND PEACE, Bryan-Wilson Treaties*.

CASUALTIES IN THE REIGNING DYNASTIES. Not a few members of the reigning families of the various German States lost their lives in the war. Prince Frederick of Saxe-Meiningen, younger brother of the reigning duke, was killed before Namur, August 23. His son was buried at Maubeuge. Prince Frederick of Lippe met his death at Liège. Prince Ernst of Lippe, a cousin of the reigning Prince Leopold IV, was another victim. Prince Maximilian of Hesse, nephew of the Kaiser, was found on the battlefield in France. Late in October a casualty list was published containing the name of Prince Henry of Reuss, son and heir of Prince Henry XXVII, the reigning Prince of Reuss, Younger Branch. In this connection it may also be noted that Prince Adalbert, third son of the Kaiser, was betrothed to Princess Adelaide, granddaughter of the Duke of Saxe-Meiningen; and Prince Oscar, the Kaiser's fifth son, was married at the outbreak of the war to Countess Sophie von Bassowitch.

AFFAIRS IN THE STATES OF THE EMPIRE. In an earlier paragraph the Zabern affair, an incident in the occupation of Alsace-Lorraine by German garrisons, has been discussed in its bearing upon the general political situation in Germany. One of its consequences for Alsace-Lorraine was the resignation on January 29 of the Statthalter Count Wedel and the leading members of the ministry of the Reichsland: Baron Zorn von Bulach, the secretary of state; Herr Mandel, minister of the interior; Dr. Petri, education and justice; Herr Köhler, finance and commerce. Herr Köhler and Count Wedel were induced to retain their offices; but the resignations of the others were accepted. Baron Zorn von Bulach received the crown of the first class of the Order of the Red Eagle, and was given a seat in the upper chamber of the Diet of the Reichsland; his successor was Count Rödern, a former Prussian official, who took the portfolio of the interior in addition to the secretaryship of state. Baron von Stein, a Bavarian, was appointed to take charge of agriculture and public works. In April Count von Wedel retired from the office of Statthalter; and was exalted by the Kaiser to the rank of prince. His successor as Statthalter was the Prussian minister of the interior, von Dallwitz, a magistrate hardly likely to conciliate the irate Alsations. One of the new Statthalter's first acts was his refusal to sanction the reelection of Mayor Knöpffler of Strassburg, because Knöpffler had taken up a position hostile to the Imperial and military authorities in the Zabern affair. This infringement of electoral rights provoked strenuous protests even outside of the Reichsland. As examples of the severity which

characterized the new administration from the first, may be quoted the reinforced prohibition on the wearing of French colors, and the provision that henceforth army recruits from the Reichsland should not be allowed to serve in their native province. For the history of Alsace-Lorraine during the war consult the article on the WAR OF THE NATIONS.

In BAVARIA, King Ludwig III on January 7 bestowed the hereditary title of count on Baron von Hertling in recognition of that minister's distinguished public service. In March the Bavarian Chamber of Deputies passed a budgetary provision for the appropriation of 75,000 marks for the purpose of State insurance against involuntary unemployment. In BRUNSWICK, at the close of December, 1913, the Hartweg ministry resigned, having carried through the question of the succession; and a new cabinet was formed by the former minister of the interior, Herr Wolff. On March 18 an heir to the Brunswick throne was born to Duchess Victoria Louise (daughter of the Kaiser) and Duke Ernst August. In MECKLENBURG, Count Bassewitz was replaced as head of the ministry by Privy Councilor Langfeld. On June 11 Grand Duke Adolf Friedrich of MECKLENBURG-STRE-LITZ died in Berlin, and was succeeded by his thirty-two-year-old son, Adolf Friedrich.

In PRUSSIA a spirit of reactionary particularism was manifested in January, when the Prussian Conservatives in the Prussian Herrenhaus (House of Lords) attacked the imperial policy of Von Bethmann-Hollweg, and demanded to know whether Prussia's rightful power was to be overshadowed by the influence of the smaller States in the Reichstag. Especially the Prussian Conservatives resented the way in which the Imperial Defense Levy had been adjusted to bear most heavily upon the wealthier classes. Dr. Kaempf, as president of the Reichstag, on the 14th, publicly repudiated the criticisms leveled against that body by the Prussian Conservatives. The appointment of the Prussian minister of the interior, Von Dallwitz, to the post of Statthalter of the Reichsland removed from the Prussian cabinet the most strenuous antagonist of even moderately democratic electoral reform. The new minister of the interior, Herr Loebell, a friend and an associate of Ex-Chancellor von Bülow, took office about May 1. The hope that the change in the personnel of the ministry might mean also a favorable change in the policy towards electoral reform, was sadly disappointed on May 18 when in the course of his inaugural speech Herr Loebell declared that he had no intention of drawing up a Franchise Bill. A debate in the Prussian Herrenhaus towards the end of May was enlivened by the assertion made by several speakers that the conciliatory policy adopted in 1907 for the pacification of North Schleswig had completely broken down, and that the only solution of the Schleswig problem would be the adoption of positive measures for strengthening the *Deutschtum* (the German character) of the province in opposition to the Danish agitation. On this occasion Von Bethmann-Hollweg uttered a warning against exciting Denmark by too much Chauvinistic talk. In October the Prussian Diet held a brief war session, and unanimously granted a war credit of 1,500,000,000 marks. Vice-Chancellor Delbrück informed the Diet that the government intended to indemnify

the people of East Prussia for their losses at the hands of the Russians, and that extensive public works would be undertaken, especially the draining of the moorlands, with the two-fold object of relieving unemployment and increasing the production of food.

In SAXE-COBURG-GOTHA a dispute over the question of popular rights in the forests led to a ministerial crisis, which issued in the resignation of the prime minister, Von Richter. The new premier was identified with the court party which had supported the duke in the clearly joined issue against Von Richter, and against the body of popular opinion, the duke's determination to extend his own personal rights over his forest-lands being deeply resented by the peasants. Duke Georg II of SAXE-MEININGEN died June 25, in his eighty-ninth year; he was succeeded by his eldest son, Prince Bernhard, who was born April 1, 1851.

GERMANY, ARCHAEOLOGY OF. See ARCHAEOLOGY.

GIBRALTAR. A narrow peninsula extending southward from the southwest coast of Spain; a British crown colony, naval and coal-ging station, and *entrepôt* of the British trade with the Barbary States. The port is free. Its area is $1\frac{1}{2}$ square miles, and its greatest elevation 1439 feet. Population, 1912, 18,446, exclusive of military; 18,381 in 1881. About 450 people are employed in tobacco manufactories, and 1200 in the coal depots. There are no trade returns. Tonnage entered and cleared, 1912, 11,999,002, of which 7,332,556 British. Revenue, 1912, £105,738; expenditure, £81,613. Lieut. Gen. Sir H. S. G. Miles was Governor and commander-in-chief in 1914; he is sole administrator, without executive or legislative councils.

GIFTS AND BEQUESTS. The following list of gifts and bequests made during 1914 is taken from the annual record, published in the *Chicago Tribune*. It has, however, been arranged alphabetically. The amounts given in gifts and bequests during the year surpassed those of any previous year. The list takes no account of contributions made to the Red Cross and other national funds, or of the value of the cargoes, Christmas ships, shipments of grain and clothing, and personal donations sent to Europe. The value of such gifts would probably raise the total for the year to \$250,000,000. Outside of war charities the total for the year amounts to \$218,599,482, as compared with \$169,841,442 in 1913. It must be taken into consideration that this total includes only donations of a public character which have been made public. If there were to be added the sums that have been privately given and have not appeared in print, it is probable that the total would at least be doubled. Of the amounts given and publicly recorded, \$146,970,388 represents donations, and \$71,629,094 bequests. This large sum was distributed as follows: Charities of various kinds, \$104,377,970; educational institutions, \$90,741,210; religious organizations, \$3,685,798; art museums, galleries, and municipal improvements, \$17,913,000, and to libraries \$1,881,000. Gifts and bequests amounting to \$26,630,947 were given by women. A notable feature of the gifts and bequests made during the year is that more than one-half came from thirty-nine persons. The chief givers, as in previous years, were Andrew Carnegie, John D. Rockefeller, and Mrs. Russell Sage. Among

other notable gifts and bequests made during the year may be noted the following: Henry Phipps, New York, to various institutions, \$15,000,000; by various donors to the Cleveland Foundation, \$20,000,000; W. H. Riggs, gift of armor to the Metropolitan Museum of Art, \$5,000,000; Mrs. Morris K. Jesup, to various charitable institutions of New York City, \$7,960,000. See UNIVERSITIES AND COLLEGES, *Gifts and Endowments*.

Abbie, Hannah B., New Bedford, Mass., will to charity, \$20,000.
 Abbie, Mrs. William, New Bedford, Mass., will to charity, \$90,000; to Institute of Technology, \$10,000.
 Adams, Mary D., Northton, Mass., will to charity, \$10,000.
 Alexander, W. A., Mobile, Ala., will to church, \$17,000.
 Allen, Edmund, Philadelphia, Pa., gift to employees, \$5000.
 American Academy, Rome, gift by Rockefeller foundation, \$10,000.
 American Jewish Commission, New York, gift to charity, \$27,000.
 American Museum of Natural History, will by Mrs. Morris K. Jesup, \$5,000,000; gift by Morris Loeb, \$36,947.
 Anatolia College, will by Sarkis G. Telfaya, \$10,000.
 Andover Academy, will by Melville C. Day, \$300,000.
 Andrews, Eliza, Baltimore, Md., will to church, \$282,005.
 Art Institute, Chicago, Ill., will by Alexander A. McKay, \$100,000.
 Art Museum, will by Josephine A. Binney, \$5000; will by Hugo Reisinger, \$150,000.
 Arts, Z. B., Chicago, Ill., will to Fredericksburg, Md., library, \$100,000.
 Atlanta, Ga., gift to greater Baptist hospital by various donors, \$285,000.
 Augusta, Ga., will to library by W. H. Wolverton, \$25,000.
 Baby fund, Chicago, Ill., gift by various donors, \$51,692.
 Bacon, A. O., Macon, Ga., will of park to city, \$110,000.
 Baldwin, Mrs. H. A., Burbank, Colo., gifts to church, \$55,000.
 Balentine, Mrs. Robert, Newark, N. J., gift of swimming pool, \$20,000.
 Balton, Mahlon, Philadelphia, Pa., will to charity, \$66,000.
 Bangor library, will by George S. Snyder, \$5000.
 Barlow, Sarah R., Paterson, N. J., will to charity, \$15,000.
 Barnard College, gift by Mrs. E. H. Harriman, \$50,000.
 Bartlett, Abigail, Deering, N. H., gift to Dartmouth College, \$10,000.
 Beebe, J. A., Barnstable, Mass., will to Harvard University, \$170,000; to church, \$50,000.
 Belknap, Lucy, Louisville, Ky., will to charity, \$30,000; to Lincoln Institute, \$20,000.
 Belknap, W. R., Louisville, Ky., will to church, \$5000; to charity, \$5000.
 Belmont, Mrs. O. H. P., New York, gift to Suffrage cause, \$5000.
 Beloit College, gift by various donors, \$50,000.
 Bennett, Elizabeth D., Brookline, Mass., will to charity, \$6000.
 Benton, J. H., New York, gift to library, \$10,000.
 Berlin University, gift by unnamed donor, St. Louis, Mo., \$50,000.
 Bethlehem, Pa., gift to Band hall by Charles M. Schwab, \$100,000.
 Bigelow Monument fund, gift by Andrew Carnegie, \$5000.
 Billings, Julia, Woodstock, Vt., will to Northfield seminary, \$120,000.
 Binney, Josephine A., Providence, R. I., will to libraries, \$22,000; to charity, \$10,000; to church, \$10,000; to Brown University, \$10,000; to Art Museum, \$5000.
 Bird Protective Society, gift by Mrs. Russell Sage, \$10,000.
 Blair, Mrs. Devitt C., Belvidere, N. Y., will to charity, \$40,000.
 Block, Joseph, Chicago, will to charity, \$20,000.
 Bohn, Emma, Glenside, Pa., will to charity, \$22,000.
 Borndt, Edith, Philadelphia, Pa., will to charity, \$5000.
 Boston, Mass., gift to charity by various donors,

\$205,258; will to city by Charles A. Greenwood, \$40,000.
 Boston Museum of Fine Arts, will by Nathaniel Thayer, \$50,000.
 Boston University, gift by various donors, \$11,000; gift by unnamed donor, \$30,000.
 Boston University, school of medicine, gift by various donors, \$100,000.
 Bourne, Frederick A., New York, gift to Cathedral of St. John the Divine, \$500,000.
 Bowdoin College, will by Frank Hartley, \$290,420; by Edwin K. Smith, \$500,000; by George S. Snyder, \$10,000.
 Bowen, Helen A., Philadelphia, Pa., gift to Mt. Airy Seminary, \$20,000.
 Boys' home, gift by Francis A. Hardy, \$100,000.
 Bradley, Annie G., Manchester, N. H., will to art institute, \$10,000; to charity, \$10,000; to church, \$5000.
 Brady family, gift to Yale University, \$625,000.
 Brasseler, T. S., will to Catholic University of America, \$1,000,000; to Parochial school, \$127,000.
 Bridgeton, Me., Academy, gift by Henry D. Cleaver, \$22,500.
 Bridgeton, N. Y., will to library by E. W. Shoemaker, \$5000.
 Brigham, Ellen D., Marlboro, Mass., will to church, \$10,000.
 Brooklyn Institute of Arts and Sciences, will by Lina V. Happel, \$250,000.
 Browne, Rebecca W., Boston, Mass., will to Harvard University, \$10,000.
 Brown University, will by Josephine A. Binney, \$10,000; gift by Philadelphia alumni, \$10,000; will by Ferris S. Thompson, \$1,500,000.
 Bryn Mawr College, gift by Elizabeth F. Shippen, \$10,000.
 Buck, Harris, Decatur, Ill., gift to Illinois Wesleyan University, \$200,000.
 Buffum, Mary L., Providence, R. I., will to charity, \$10,000.
 Bulgarian sufferers, gift by J. D. Rockefeller, \$10,000.
 Burke, J. M., residuary estate of, to charity, \$2,000,000.
 Burke, Mary E. D., Orleans, Mass., will to charity \$5000.
 Burnham, Frances E., Seabrook, N. H., will to charity, \$125,000.
 Busch, Mrs. Adolphus, gift to Harvard University, \$50,000.
 Butler, Edward H., Buffalo, N. Y., will to charity, \$165,000.
 Byler, Martha F., gift to Yale University, \$10,000.
 Cadwallader, J. L., New York, will to public library, \$100,000; to Metropolitan Museum of Art, \$25,000; to Princeton University, \$25,000; to Harvard University, \$25,000; to New York Zoological Society, \$20,000.
 Caldwell, Mrs. B. D., E. Orange, N. J., gift to De Pauw University, \$9100.
 California University gift by Mrs. F. W. Hooper, \$2,000,000; by various donors, \$1,307,929.
 Calvert, Mary, St. Louis, Mo., gift to children's hospital, \$50,000.
 Campbell, Thomas, St. Louis, Mo., conditional bequest for hospital to St. Louis University, \$40,000,000.
 Cancer research, gift by Lambert Snyder, \$25,000.
 Candler, Asa, Atlanta, Ga., gift to Methodist University, \$1,000,000.
 Capen, S. B., Boston, Mass., will to church, \$14,600.
 Carland, Mary, New York, will to church, \$20,000.
 Carlinville, Ill., will to library by Susan Dick, \$15,000.
 Carnegie, Andrew, gift to Bigelow monument fund, \$5000; to New York Zoological Park, \$100,000; to Pittsburgh Carnegie Institution, \$2,000,000; to churches for promotion of international peace, \$2,000,000; to Rockford College, \$35,000; to United Kingdom trust \$10,000; gift of library to Clovis, Cal., \$7,000; to Corydon, Ind., \$7500; to Dover, N. J., \$20,000; to Greendale, Mass., \$35,000; to Hamburg, N. Y., \$5000; to Medford, Wis., \$6000; to Mooresville, Ind., \$10,000; to New Haven, Conn., \$60,000; to Oakland, Cal., \$140,000; to Orange, N. J., \$40,000; to San Anselmo, Cal., \$10,000; to St. Paul, Minn., \$75,000; to West Allen, Wis., \$10,000.
 Carnegie, Mrs. Andrew, gift to charity, \$5000.
 Carnegie Education Board, gift to Washington University, St. Louis, \$750,000.
 Carpenter, Susan M., Philadelphia, Pa., will to church, \$10,000.
 Cathedral of St. John the Divine, gift by Frederick G. Bourne, \$500,000.
 Catholic education, gift by Cardinal Gibbons, \$300,000.

- Catholic University of America, will by T. S. Braasler, \$1,000,000; gift by Knights of Columbus, \$500,000.
- Central College, Fayette, Mo., gift by various donors, \$265,000.
- Central Female College, gift by W. B. Palmore, \$40,000.
- Chamberlain, Eleazar D., Concord, Mass., will to charity, \$70,000.
- Chamberlain, Emily, New York, will to charity, \$8000.
- Chamber of Commerce, New York, gift for College of Commerce, \$800,000.
- Chapin, Augusta E., New York, will to charity, \$82,000.
- Chapin, Emil and family, Chicago, Ill., gift to Half Orphan Asylum, \$70,000.
- Chapin, S. W., Springfield, Mass., will to hospital \$70,000.
- Charity ball, Chicago, Ill., \$25,000.
- Chicago, Ill., gift of Country Club to social workers by Julius Rosenwald, \$50,000; gift of fountain to city by David Wallach, \$5000.
- Children's gift, New York to missions, \$9875.
- Children's hospital, St. Louis, Mo., gift by Mary Calvert, \$50,000.
- Chorley, Charlotte, Philadelphia, Pa., will to charity, \$8000.
- Chorley, Margaret E., Philadelphia, Pa., will to charity, \$7000.
- Christian church, Texas, gift by various donors, \$400,000.
- Cincinnati Art Museum, gift by Mrs. Mary M. Emery, \$350,000.
- Clark, J. H., Amherst, N. H., will to church, \$10,000.
- Clark, William A., gift to Corcoran Gallery, \$5000.
- Clark, W. M., gift for Montana building, Panama Exposition, \$10,000.
- Clarkson, Josephine M., will to University of Rochester, \$7000.
- Cleaver, Henry D., will to Bridgeton, Me., Academy, \$22,500.
- Clement, Clara E., Kenton, Ohio, will to church, \$6300.
- Cleveland, Eliza C., Jamaica Plain, Mass., will to charity, \$22,000.
- Cleveland foundation, gift by various donors, \$20,000,000.
- Clovie, Cal., gift of library by Andrew Carnegie, \$7000.
- Coburn Classical School, gift by various donors, \$75,000.
- Cocks, W. B., New York, will to charity, \$15,000.
- Colis, Harry C., Washington, D. C., gift to hospital, \$10,000.
- Collard, George W., New York, gift to church, \$20,000.
- Collard, Rev. Joseph, Worcester, Mass., gift to church, \$6675.
- College of Commerce, gift by Chamber of Commerce, \$800,000; gift of unnamed donor, \$700,000.
- Collegiate Board of National Presbyterian Church, gift to Henry Kendall College, \$5000.
- Collins, Elizabeth, Philadelphia, Pa., will to charity, \$5000.
- Collins, T. D., Franklin, Pa., will to missions, \$250,000.
- Colorado College, gift by unnamed donor, \$100,000.
- Columbian World's Fair fund, devoted to charity, \$94,000.
